In the lull following the bustle of "bedding out," and other essential garden work in a particularly busy period the requirements of the spring bedding can now have attention. To obtain good bushy plants of wallflower that will transplant readily and winter well, the seedlings should be pricked off when they are 2ins. to 3ins. high. For this purpose choose a well prepared, but rather poor piece of ground, made firm by treading, if necessary. Form beds 4ft. wide which will accommodate five lines of plants and the seedlings 6ins. apart in the rows. Cheiranthus Allionii, Erysimum Golden Gem, sweet williams, etc., will be entirely suited with this method of treatment. Less space may be allowed between the plants if room is restricted. If the operation is done in hot, dry weather, watering and shade will be essential until growth starts.

The stock plants of arabis fl. pl., aubrietia, polyanthus, daisies, can now be separated into useful sized pieces and replanted. A more satisfactory method, by which better plants are produced, is to propagate the arabis and aubrietia from cuttings which should be about 4ins. long, dibbled in 2ins. or 3ins. apart in frames containing light sandy soil. Water, shade, and keep lights closed until rooted, afterwards giving full exposure. In this district I find that cuttings of Alyssum saxatile compactum winter better than seedling plants.

It is good practice to raise a number of polyanthus from seed each year, as constant reproduction by vegetative means results in deterioration of vitality and loss in size of flower. Seedlings of these will be of sufficient size to admit of pricking off into frames in a light mixture, principally leaf mould. Afford protection in the earlier stages by using the lights, subsequently hardening off and transplanting to nursery rows to attain a suitable size for autumn planting.

THE FRUIT GARDEN.

The summer pruning of red currant and gooseberry bushes is a practice worthy of attention for many obvious reasons. The method is well known, consisting of pinching side shoots at the fourth or fifth leaf, and in tipping the leaders of currants as well. Where American gooseberry mildew is prevalent the leaders of these may be tipped with some profit in mitigating the infestation.

Summer pruning concentrates the vigour of the bush in the formation of basal fruit buds. It allows a freer circulation of air, light, and sun to penetrate the bushes with all their beneficial influences in ripening wood and fruit.

A great deal of good accrues from thinning out the young growths of raspberries, leaving approximately the number of these required to form the following year's fruiting canes. Gooseberries are now a suitable size for bottling purposes. If pulling is delayed the skin becomes tough and unpalatable when cooked.

Tie in the young wood of peach trees on walls out of doors, pinching surplus shoots overlooked in disbudding. Wall trees should be closely watched for aphis and sprayed if needful. As their situation does not always permit of these having a full supply of water by rainfall, and much of it too often abstracted from the borders by plants growing too near them. It is essential for the successful cultivation of wall trees that the water supply should be adequate. In the case of those carrying heavy crops, it will pay to thin out the fruits and assist the swelling of the remainder by giving liquid manure and occasional applications of lime in solution in the stoning period of cherries, plums and peaches.

SHRUBS.

It is a matter of grave reflection how we gardeners are so consistently inconsistent; albeit there are exceptions. We vigorously denude our buddleias, ceanothus, wistaria, etc., by pruning back to within a bud or two of the old wood each winter. This induces the plants to produce strong young wood, which gives the finer flowers the following autumn.

All of us know quite well that the flowered shoots of Philadelphus coronarius, Deutzia crenata fl. pl. and others should be cut out when the bloom is over, and that weigela, kerrias, etc., are greatly improved by having the worn out flowering shoots thinned out. While some of the quick-growing spiræas, like Douglasii, Anthony Waterer, which flower on the current year's wood, should have the old wood cut back and the young growth thinned out in spring to encourage strong branches on which the best inflorescences are borne.

Others, like arguta, Thunbergi, which flower in early summer, require thinning after flowering. While species such as ariæfolia and prunifolia—if my specimens are correctly named—are greatly improved by having the old flowering shoots and dead wood cut out. Lilacs should have the centres of the plants kept open and suckers from the rootstocks cut away, while the removal of the old flower heads is beneficial.

Doune, Perthshire. W. MCCARRELL.

GREENHOUSE & CONSERVATORY.

Humea elegans.—Where an early batch of large plants is required a sowing of seed should be made in a cool house some time this month—making the main sowing about the middle of August in a cool greenhouse. The young plants should be potted on as they require it until they are in 5in. and 3in. pots, the larger size for the earlier sowing, in which sizes they should be wintered. Humeas are generally considered to be difficult to grow successfully, but provided they are grown cool and carefully watered, no difficulty should be experienced in their younger stage, although great care is required in repotting and subsequent watering when they are transferred to their flowering pots. They should always be repotted before they become potbound.

Gilia coronopifolia.—A sowing of this beautiful biennial should now be made in a cool greenhouse. When large enough to handle, prick off the seedlings into pans, or 48-sized pots, afterwards transferring them to thumb pots. Well grown plants should be potted on into large 60-sized pots, in which they should pass the winter. In their younger stages a light, well drained compost is essential. Like many other Californian plants they are apt to prove troublesome during our dull and sunless winters, and should be given a position well up to the roof glass in a light, airy greenhouse, giving no more water at the root than is necessary to keep them from suffering.

Mignonette and Other Annuals.—Well grown plants of this sweet-scented annual are always acceptable, and a supply should be kept up for the greenhouse more or less all the year round, except during the summer, when it is in flower outdoors. If a sowing is made in a cool house or cold frame at this time, the resulting plants should prove useful during late summer and autumn. It is the usual practice to sow the seed directly into the flowering pots, usually 5in. in size, under the mistaken idea that mignonette cannot be successfully transplanted. Young seedlings can, however, be just as easily transplanted as most other annual plants, indeed, it has the advantage of inducing them to develop shoots from the base of the plants. The young seedlings should be pricked off, three or four into thumb pots, afterwards potting them on until they are in 6in. pots, in which fine specimens should be grown. The compost should consist of a good mellow loam, with the addition of some dried cow manure or sheep droppings and enough sand or, better still, as lime is essential, some old mortar rubble. If this is not available, a dusting of lime should be added to the potting compost. Very firm potting is essential, also careful watering and perfectly cool treatment. Many other annuals may be sown at this time for giving a display in the conservatory during late summer and autumn. They include such general favourites as schizanthus, Lobelia tenuior, Statice Suworowi and Collinsia bicolor. Some of the annual chrysanthemums, as represented by C. carinatum, Morning and Evening Star, are very useful, in fact, all the annuals that are usually used for pot work may be successfully used for this purpose. It is essential that they should be grown perfectly cool and with as little shade as possible.

Hydrangeas which are so popular to-day in many new varieties, should now be propagated as cuttings are available. They root readily in a close case, emitting roots freely from every part of the stem; as they do, it is not necessary to secure nodal cuttings. Cuttings are best inserted singly in small pots; when rooted, stand them out on the stage, well up to the roof glass. In a few days they may be transferred to 5in. pots. When established in them they may be transferred to cold frames in which they can be wintered. By propagating successional batches of cuttings, a supply of flowering plants may be kept up over a long period. Where it is desired to produce blue flowers—and they are always popular—a preparation for this purpose can be obtained from garden sundriesmen. For producing blue flowers the pink-flowered varieties must be used and lime should not be part of the potting compost.

BERKHAMSTED.

CYTISUS SCOPARIUS.

SOME NOTABLE VARIETIES.

WITHOUT overlooking the large and ever-increasing number of beautiful brooms, which owe their origin for the most part to C. s. var. Andreanus, the object of this note is to allude to the best of the various self-coloured forms of the "Bonnie Broom," which come nearest the type.

C. scoparius, as we all know it, is still the finest hardy yellow broom of anything like its stature. One of the most valuable members of its clan in its own colour is the late-flowering form raised some years ago at the famous Newry Nurseries, the home of so many excellent varieties. This late broom is exceptionally vigorous in habit, but the very large yellow flowers, borne in the greatest abundance, do not appear until July or August. They are thus especially welcome at a season when so many shrubs are past flowering, and it is worthy of note that seed (preferably gathered from the last to bloom), almost invariably comes true. I have had specimens of these late brooms 8ft. high with stems 5ins. through near the base. The long, weeping branches, are singularly elegant, a darker green and very much more leafy than those of the average type.

There is a double-flowered form of C. scoparius, which is by no means a travesty upon the charm of the type, and a variety with its leaves and stems variegated with pale yellow. The latter, if seldom seen, can be recommended to those who go in for variegated shrubs and it is one that blends very pleasingly with pale blue and silvery subjects. Then there is C. s. var. pendulus (C. grandiflorus), which is a remarkably distinctive form, notable for its prostrate habit and unusually large blooms. Gardeners whose taste leans towards standard brooms will find this variety an excellent weeping subject when grafted on laburnum, but I like it best hanging over a bold rock, bank or old wall.

S. s. var. sulphureus (pallidus), the "Moonlight Broom," is an exceedingly choice shrub. It is dwarfer, stouter and bushier than the type and the large blooms, which are yielded in the greatest profusion, are a glossy, creamy ivory, approaching nankeen. Sulphur coloured they certainly are not, but the name

ANTIRRHINUMS

IT'S only the fact that we grow and deliver especially good plants that we wish to advertise. The brightness, the long-flowering life, the wonderful adaptability of Antirrhinums (Snapdragons) are known to everyone. Although our plants are properly grown, transplanted, well rooted, hardened off, in all ways particularly good, as becomes a firm which reckon to do things well, the price is only

WOLVERHAMPTON FLORAL FETE

July 13th, 14th & 15th, 1926.

£1,000 IN PRIZES.

Entries close 5th July. Schedules on application to the Secretary.

"Moonlight" is a particularly happy one. This very lovely broom always attracts attention, but it is never quite so enchanting as when in conjunction with smoky or lavender blues. Associated in open woodland with a good form of Ceanothus thyrsiflorus, or with a background of wild hyacinths in grass, it makes a most delightful effect.—A. T. J.

SWEET PEA COMPETITION

£50 IN PRIZES

RULES.

A list of your choice of the six most popular sweet peas to be sent in in order of preference on the coupon to be found on page IV of this week's issue of THE GARDEN. *No alternative* varieties will be allowed in the one list, but readers may send in any number of lists, provided that they are written on the special coupon to be found in this and the following three issues of THE GARDEN.

Coupons must reach this office not later than Saturday, July 17th (after which date no coupons will be accepted).

The popular vote will be final, and no correspondence will be entered into over this competition.

Envelopes must be marked *Competition* and addressed to THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

The Editor will not be held responsible for letters missing in the post.

The result will be announced in THE GARDEN in the issue of August 28th.

The prizes are awarded to those whose list corresponds most closely to that arrived at by the popular vote.

If two readers tie for the first place, the first and second prizes will be equally divided; if two for the second place, the second and third prizes will be equally divided.

The Editor's decision on all points will be final.

PRIZES.

1ST PRIZE.—Goods worth **£30** from any advertiser in the pages of THE GARDEN.

2ND PRIZE.—Goods worth **£10** from any advertiser in the pages of THE GARDEN.

3RD PRIZE.—Goods worth **£5** from any advertiser in the pages of THE GARDEN.

20 CONSOLATION PRIZES of **5s.** each from any advertiser in the pages of THE GARDEN.

THE GARDEN

VOL. XC.—No. 2847. JUNE 26, 1926

BRITISH APPLES

THE publication of the fruit section of the report of the Imperial Economic Committee on Marketing and Preparing for Market of Foodstuffs Produced in the Overseas Parts of the Empire—to give it its full title—should be of great interest not only to consumers but also to growers in this country. Particularly important is the section devoted to apples, for here is a fruit that grows excellently well in this country and is most popular. Although the Report deals primarily with fruit-growing in the British Empire, and so the suggestions to be found therein are as much for the colonial as for the home grower, yet the statistics given show that the home producer falls lamentably behind his colonial and foreign competitors.

The consumption of apples per head in the United Kingdom has risen from 14.7lb. in 1913 to 22.8lb. in 1924, an increase of about 30 per cent; yet, whereas before the war three-quarters of our apples were grown on British soil, now the proportion is only slightly over half. The Report proves that the United States dominates the United Kingdom apple market. Owing to the fact that the average consumption in the United States is 240 apples per head per annum, more than double our consumption, the United States home apple trade is in a flourishing condition. In order to keep the price for home consumption steady, they throw practically the entire surplus on the export market. So important is this point that an increase of only 8 per cent. in production results in an increase of 150 per cent. in the quantity exported. A large proportion of this comes to the British Isles.

OUR SWEET PEA COMPETITION

£50

IN PRIZES

(See page vi.)

Everyone will agree that the home producer, particularly of dessert apples, has a hard fight against organised and skilful overseas competition. On the other hand, many will say that the home producer has not made the most of his opportunities, that he is conservative to the point of stupidity. Let us try to put the pros and cons of home production in a simple form. The excuses of the home grower are:

(1) A climate so variable that a paying crop is never a certainty.
(2) Intensive competition from imported apples.
(3) Lack of capital.
(4) The small proportion that he gets of the ultimate price paid by the consumer. Two examples are given in the Report of Canadian apples. In one the net return to the producer on British Columbia boxed apples was 6 per cent. of the price paid by the consumer in the United Kingdom. In the other the return on Nova Scotia barrel apples was 10½ per cent. A proportion of this goes in freight and insurance, but the small percentage of profit is alarming.
(5) The spread between the wholesale and retail prices in this country. Examples are given in the Report of investigations made in London on January 19th and 20th, 1926. British Columbia boxed apples, 124 per cent.; Nova Scotia barrel apples, averaging 120 per cent. Probably the percentage is the same in the case of home-grown fruit. Even allowing for wastage and damage this is an enormous retail profit.
(6) The extraordinary variation in wholesale prices according whether there is a glut or a short crop.

Where the home grower falls short is:

(1) Lack of organisation in the way of co-operative selling and so on.
(2) The cultivation of unprofitable varieties. The Report states that South Australia alone shipped fifty-six varieties in 1924. The number of varieties grown commercially in this country is probably greater.
(3) Lack of advertisement, absence of show cards, and so on.
(4) Most important of all, the lack of grading or of attractive packing or any other inducement for the consumer to buy British apples.

Coals of fire will probably be heaped on my head, but I will be frank and say that I rarely buy home-grown dessert apples. I cannot afford these attractive baskets of perfect home-produced fruit as selected by a West End fruiterer, and in most cases the local crop is exposed for sale in dirty baskets or barrels, the small mixed with the large, the good with the bad. They are unattractive to look at and are rarely in perfect condition. Other trades have found that food attractively wrapped commands a large sale, so why not in the apple trade? It is said that an improvement in grading and packing is under way; if so, it is not yet noticeable.

This, of course, presupposes the fact that private growers are also to blame, which is the case. The truth is that not enough trouble is taken over apple cultivation. Amateurs consider that they should have some apple trees, so an orchard is planted, often with little regard to situation and still less to the varieties that are chosen. Once a little pruning and an occasional spraying are finished they consider that work is over for the year, and the apples are left to take care of themselves. If home-grown fruit is to compete with imported, more pains must be taken, not only to intensify its cultivation, but also to make it more attractive to the consumer.

E. H. M. C.

WORTHY PLANTS.—V

PÆONIA OFFICINALIS LOBATA.

SO much is heard nowadays of the glories of the newer peonies that it is only fair to name the old, though somewhat uncommon, Pæonia officinalis lobata as a worthy plant. For delicacy and grace it is the superior of most modern peonies. The colour is wonderful and difficult to describe; perhaps it could be called a mixture between a flaming orange-scarlet and a deep tomato-red. The flowers are not large, rarely exceeding 3ins. in diameter, but are of perfect shape. The flower stems attain a height of about 18ins. It is an easy plant to grow and often flowers the first season after planting. This peony was introduced to England from the Royal Gardens at Paris in 1821.

THE Council of the Royal Horticultural Society, at their meeting on Tuesday, June 15th, appointed Lieutenant-Colonel F. R. Durham, C.B.E., M.C., to be secretary of the Society. The President, Lord Lambourne, took the opportunity of expressing the unanimous appreciation felt by the Council of the services rendered to the Society by the assistant secretary, Mr. A. Simmonds, since the death of the late secretary, Mr. W. R. Dykes. Lieutenant-Colonel Frank R. Durham, C.B.E., M.C., M.Inst.C.E., is fifty-four years old and was educated at Rugby and at University College, London. After leaving college he was engaged in engineering, and in 1914 joined the Army as a private and was gradually promoted to the rank of major, receiving the following decorations: O.B.E., M.C. and Chevalier Legion d'Honneur. In 1919 he was appointed Director of Works of the Imperial War Graves Commission, the appointment terminating on December 31st, 1925. For services rendered to the Commission he was promoted to the rank of lieutenant-colonel and received the C.B.E. Colonel Durham has always been interested in horticulture; he has collected a number of new plants and has published papers in the Journal of the Society. He comes of a distinguished family, which includes Dr. H. E. Durham, the authority on cider and perry apples; Miss F. H. Durham, C.B.E., Chief Woman Inspector of the Ministry of Labour; and Miss M. E. Durham, the well known traveller and writer on Balkan matters.

IN 1920 Miss L. Jones-Bateman of Cae Glass, Abergele, presented to the Royal Horticultural Society a valuable silver-gilt replica of the Warwick Vase to be used for the encouragement of fruit production. It was decided to offer it triennially for researches in the growing of hardy fruits, figs, grapes and peaches in the open or under glass, and it is therefore available for award in 1926. Candidates should submit accounts of their work to the R.H.S. by October 31st. The work dealt with must have been carried out in the United Kingdom mainly during the past five years. The cup will be held for three years by the successful candidate, who must give a bond for its safe return, and when the cup is relinquished the holder will receive a commemorative gold medal. The holder will be eligible to compete on the next or any succeeding occasion. The assessors will be three, two appointed by the Royal Horticultural Society and one by the National Farmers' Union, and they will report to the Council of the Royal Horticultural Society upon the originality and comparative potential value to the fruit-growing industry of the work of the candidates. The Council of the Royal Horticultural Society will award or withhold the cup at its discretion.

MANY of our readers are finding that bud dropping of sweet peas is particularly prevalent this year. In order to re-assure them that this is only a temporary complaint that will pass as soon as weather conditions alter for the better, we print a letter sent to us by one of the best known growers of sweet peas. "What is bud-dropping? It is certainly not a disease and may best be described as a complaint—by no means serious—usually caused by unfavourable weather conditions. The buds fail to develop, and drop off before they open, sometimes every bud and in others, a few only, leaving one or two blooms on the stems where there would normally have been three or four. More often than not, it occurs when the plants are otherwise looking the very picture of health, and is altogether aggravating to the grower. The wet and cold spells experienced this summer, following an exceptionally warm, late spring, have made bud-dropping more prevalent than in an average season. There is no need for alarm, for the annoying symptoms will quickly pass with more favourable weather conditions. Only once or twice in my experience have I heard of plants dropping their buds throughout the entire season. Autumn sown plants, sown rather thickly in their flowering positions seem, for some reason, more susceptible than transplanted plants, whether autumn or spring sown, and the first half of their flowering period is a much more likely time than the latter half."

"THERE are several conditions which, separately or combined, may cause bud-dropping. First and most frequent are wet and cold spells; then badly drained soil, lack of sunshine, over watering or over feeding, and occasionally, unfirm soil. The remedy is to give, wherever possible, opposite conditions to those which were the cause. Weather conditions are beyond control, but the grower can cease watering and feeding for a time, until the plants right themselves. Soil with a tendency to bad drainage may be (at least in part), corrected in the winter when trenching, by throwing anything that will act as drainage into the bottom—stones, crocks, sticks, garden refuse or anything porous. On a heavy clay subsoil, it is wise to trench all over the entire plot and not in strips, which sometimes act as catch-pits, retaining the surface water in their bottoms. Then again, it is wise when sowing or planting to choose a part of the garden unshaded by trees or buildings, and so secure all the light possible. Unfirm soil has an obvious remedy. In concluding, it may be stated that the same conditions which cause bud-dropping, sometimes, in a milder degree, will tend to produce long, thin stems, out of proportion to the size of the flowers; irregular placing of the blooms on the stem; and dull, washed-out looking colours. This applies more to cordon-grown plants than to those grown naturally."

THE VALUE OF FOLIAGE—II

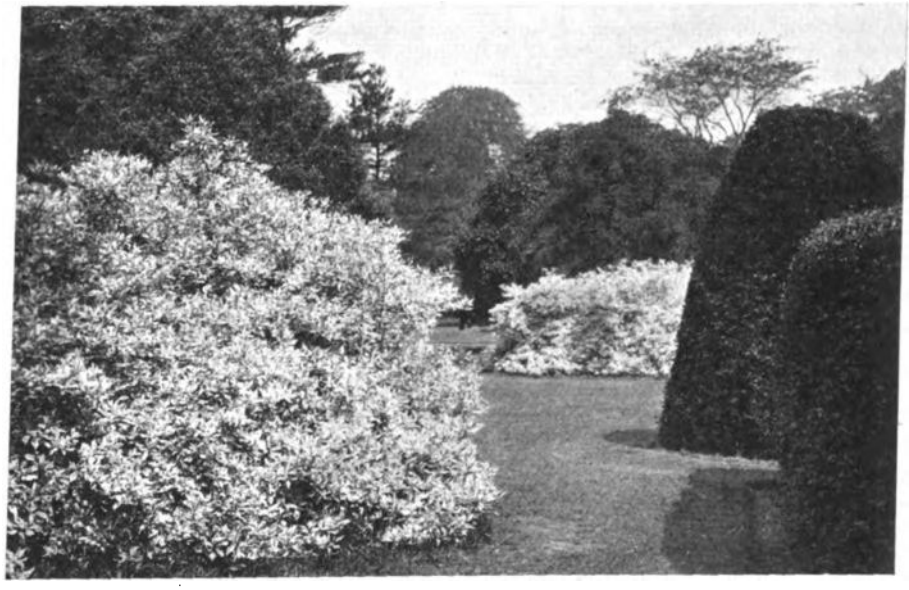
IN this article I intend to enumerate a few choice deciduous trees and shrubs bearing foliage other than green or grey.

Two very fine variegated trees which do well almost anywhere and which attain to a large size are Liriodendron tulipiferum variegata, with its large saddle-shaped leaves broadly margined with gold and the variegated form of the sweet chestnut, Castanea sativa variegata; both will make fine specimens to stand singly or will associate well with other plants in the general shrubbery or woodland. Where a bright golden effect is desired one cannot do better than plant the best forms of sambucus *e.g.*, S. racemosa serratifolius fol. aurea, with its rich golden fern-like foliage. This variety bears scarlet fruits. Another fine form is S. canadensis aurea, with bright golden foliage not so finely cut, but with very large heads of flower; there are, in addition, some good silver forms. To give height to a large group of the golden elders, standard trees of Laburnum aureum and Robinia pseudacacia aurea, both elegant and hardy trees, should be planted here and there among them, and when established, such a group could not fail to be bright and pleasing.

Other good foliage plants, some with remarkably large and beautifully coloured leaves, are to be found among the Chinese aralias. They make fine groups on lawns, in beds or among other subjects in shrubberies and are most effective. The best are A. chinensis albo marginata and A. c. aureo marginata. The large silver and golden leaves (bipinnate) will reach a yard in length, a smaller plant and perhaps not quite so hardy, but nevertheless most charmingly variegated with bright golden foliage is Acanthopanax spinosus variegata.

The cornus family alone would supply a good many persons with as many golden and silvery variegated leaved subjects as they could plant, but we do not want to overdo it with them, so I will just touch upon a few outstanding varieties. The cornus also provides us with fine winter effects as some have brilliant bark, either red or yellow and many bear showy berries.

The cornelian cherry, C. Mas, numbers among its varieties two beautiful variegated forms, one silver, the other golden, and both cover themselves with golden bloom in early spring. The red dogwood C. sanguinea, also has two variegated forms,



THE VALUE OF CONTRASTING FOLIAGE IN THE GARDEN IS SHOWN BY THIS GROUP OF GOLDEN CORNUS AND DARK HOLLIES.

silver and gold. This form is most useful, as it succeeds on dry ground, but does not mind moisture, thereby suiting it for up hill or down dale. It is a most accommodating plant and always bright, even in winter. A fit companion (though *not* variegated), is C. s. flaviramea, a golden-barked variety. C. Spæthii is another good golden variety and, like C. sanguinea, will grow just where one decides to plant it; all that it requires is plenty of room, for it is a good spreading plant.

A first rate tree, with both golden bark and leaves, is Fraxinus excelsior aurea. It never fails to attract, standing out as it does among the green of other trees, it is always bright and I think it assumes a still brighter sheen after midsummer. Philadelphus gives us good variegation in its varieties P. coronarius aureum and P. c. argentea variegata. These make desirable shrubs for the mixed shrubbery and will easily reach 10ft. The golden hop tree, Ptelea trifoliata aurea, is a good golden-hued foliage tree, making a medium-sized tree with spreading head. It puts on its brightest tints in early autumn. A very upright plant of pure gold is Ulmus montana fastigiata aurea. A golden variety of the Exeter elm is known in nurseries under the name of U. Dampieri aurea. It cannot be described as fast growing, for an elm, but given time it will make a perfect spire of pure gold. There is a golden poplar, but it makes a much more spreading tree; it is quite good where it can get plenty of room; it is Populus canadensis aurea.

A pretty little plant, suitable for the fronts of shrubberies or on the rockery, is Ribes alpinum aureum. The dwarf golden-leaved flowering currant. This must not be confused with Ribes aureum, which is a strong grower with *yellow flowers*, but green foliage.

Another good hardy subject which does well wherever one plants it is Syringa Emodi variegata. This bears large

THE ORDINARY FORM OF ARALIA CHINENSIS.

Digitized by Google

foliage of good substance, broadly margined with gold. Its flowers are rather small for a lilac, but this is more than counterbalanced by the rich foliage, which retains its colour till quite the end of the season.

Two deciduous varieties of viburnum, both decidedly ornamental and very choice are V. lantana pulverulenta whose foliage is heavily bordered with silver and gold. The other, still more remarkable, is V. l. versicolor, which, I must confess, is hard to describe. In spring the young leaves are clear yellow, gradually, as summer comes, turning to a duller and deeper golden hue, while in autumn we get a real mixture of colour on the same plant, green, crimson, orange-red, bright yellow and pure shades of orange, most truly named "versicolour." Both are hardy and will flourish even on chalk.

Weigela amabilis aurea marginata is a good thing for borders, always bright and just as free flowering as the type; it makes a much more compact bush than does the type, therefore can be planted in rather more confined quarters. There is another form, W. rosea variegata, the leaves in this plant being bordered with silver, tinged rose, a very pleasing combination. A variegated deciduous conifer offers itself under the name of Ginkgo biloba variegata, but this I am afraid is not easily obtainable.

The foregoing examples will, I think, serve to show that if we care to look around we shall find there are indeed very many beautiful things among the deciduous variegated forms of many genera of hardy trees and shrubs, and properly placed, either as single specimens or in large groups in the foreground of large or distant dark foliaged woods, or intermixed with evergreen subjects in the shrubberies, they cannot fail to add to the beauty and general interest of any garden wherever situated, as some are as hardy as the British oak or elm.

JOHN HILL.

THE IMPROVEMENT OF LUPINS

THE GARDEN VALUE OF POLYPHYLLUS HYBRIDS.

MODERN lupins are well worthy of the attention of every flower-lover. In the summer months one cannot attend a flower exhibition of any importance and not find them staged, or pick up a horticultural journal during the planting season which does not contain advertisements of them. Even though some who are unfamiliar with present-day kinds may consider lupins somewhat commonplace perennials, they certainly deserve all that has been written in their praise, and we have heard quite a lot about them of late. Their range of colouring is not now confined to blues, harsh pinks and whites. Of course, their value for garden decoration has long been realised, but there has been—in the past—a tendency to plant them among the miscellaneous "hardies" and—perhaps rightly—no enthusiasm or even special interest shown. Credit is due to a few plant hybridists who have recognised the possibilities of the lupin and greatly improved it during recent years.

A FINE MODERN POLYPHYLLUS HYBRID.

One of the most beautiful floral spectacles I have seen this season was a large bed—it must have been fully 30ft. to 40ft. square—of lupin seedlings just over a year old. They were a mixture of specially selected plants from Regal lupins (Harkness) and Downer's hybrids, in my opinion the two finest strains of hybrid lupins in commerce. Many times have I seen hybrid lupins before, both growing and exhibited, but in the mass they presented a wonderful picture, calculated to live in the memory for a long while. In spite of the large number of colours and shades (no two plants seemed identical), the effect, taken as a whole, was entirely charming. In height these hybrids vary slightly, but there is just the same stately spike as in the older kinds with the enhanced ornamental value conferred by a much wider colour range. How can one describe the diversity of their colourings? There are, of course, all shades of blues, all of them clean and bright; pinks, from a delicate porcelain tint to deepest rose; pure whites; pale buff to deep amber, with every conceivable intermediate tone. Light lemon to deepest yellow, fawns, charming salmony-biscuits, and quite a number of bicolours with keel and wings one colour and standard another. In the latter one finds pink combined with rose; blue with white; lavender, mauve and shades in between with yellow; buff with deep apricot; pink with yellow; yellow with blue; and many other delightful combinations, surprising to those acquainted only with the older polyphyllus varieties. Some of the flowers have three or more distinct shades in their "make-up," while in a few instances spikes are noticed in which the blooms, when first open, are decidedly different in colour from the older flowers on the same spike. For example, a yellowish standard will change as the flower gets older to deep rose. I must say these did not impress me so favourably as those in which the colour or colours remained constant. The good qualities of the old-time lupins have not been lost in these comparatively new hybrids. There is the same hardiness, the same ease of culture and adaptability to almost any soil and situation, and an even greater freedom of flowering, together with the lengthy flowering period given by the lateral spikes which "carry on" long after the main flower-spike has gone. They have no fads and fancies, and are little troubled with pests or diseases of any kind. One can propagate them by cuttings or division of clumps (when it is essential to preserve a particular colour or named variety) or by seeds. The better named varieties are, of course, the cream, the result of careful selection and comparison, but to those growers who are not particular as to colour, the most inexpensive method is to sow seeds of a good strain. The large bed to which I have referred contained hundreds of plants, all grown from seeds, yet one would hesitate before eliminating any one plant as displeasing to the eye.

Their cultural treatment is simplicity itself. In the first place, the seed may be sown at any time between February and August. Spring sowings should be made in shallow boxes indoors, and plants from these will flower the following autumn, although they will not be at their best until the next season. After March they may be sown out of doors in a prepared seed-bed, transplanting them later, when large enough, to their flowering quarters. Although by no means particular subjects, yet lupins will readily respond to good treatment, such as deep

Digitized by Google

digging or trenching and the liberal incorporation of manure when preparing their flowering site. They will be found effective planted singly in the mixed border, but to enjoy them to the full it is advisable to devote a bed or, better still, a long border entirely to them. Their main sphere of usefulness may be in beautifying the garden, but their value for indoor decoration must not be overlooked. Small vases are, of course, almost useless (unless small lateral spikes are used), but arrange them in large vases or ornamental baskets and they will be found most effective. C. H. A. S.

NOTES ON DAFFODILS

(*Continued from page* 349.)

THE most interesting flowers, however, were probably among those shown in the competitive classes. The following four or five stood out as about the best blooms in the Show: Two perfectly glorious blooms of the superb pure white trumpet Beersheba were shown in the single bloom class, one from County Dublin, Ireland, and the other grown by myself; they must have measured fully 5ins. in diameter, and were carried on tall strong stems, the magnificent perianths were beautifully regular and overlapping and standing perfectly flat at right angles to the slender graceful trumpets; this flower is easily supreme among all white trumpets yet seen, and has worthily gained the highest award, not only from the R.H.S. Narcissus Committee, but from the Midland Daffodil Society. The flower that gained first in the class for single blooms of yellow trumpets was a wonderful bloom of Brimstone, shown by Mr. W. B. Cranfield, of perfectly beautiful form with gracefully set perianth of ample breadth, and smooth, beautifully flanged, evenly serrated trumpet; the flower has great substance and beautiful texture, but its great beauty lies in its unique and wonderful, clear, luminous self sulphur-lemon colour. No. 401 (subsequently named Jack Horner), shown by Mr. J. L. Richardson, also in the single bloom class, was, perhaps, the finest bicolor trumpet I have ever seen; an immense flower of superb quality with great broad, flat, white perianth of rich smooth texture, and perfectly balanced soft yellow trumpet slightly flanged and fringed at the mouth. Mr. P. D. Williams showed a magnificent and quite distinct incomparabilis called Folly; this had broad, milk white perianth which slightly reflexed, the petals in-curving at their edges after the style of Poeticus recurvus, and a bowl-shaped crown of clear orange scarlet whose colour, Mr. Williams told me, was really sun-resisting, which is a notable achievement. Comrade, shown by Mr. W. Welshman of Wisbech, a small or medium-sized Leedsii of quite perfect form and quality, was regarded by some as the flower of the Show; the perianth is very round and regular, of marble-like smoothness and substance, pure white with a hint of greenness at the base and an ivory cup.

Taking a more general survey of all the various classes, the following flowers were outstanding. No. 749 shown by Mr. P. D. Williams, a large incomparabilis of refined quality with clear bright lemon perianth and clear orange scarlet, goblet-shaped crown; also No. 146, a big white triandrus Leedsii of unusual size for this type. Carminowe, a large flower close to if not pure poeticus, with snow white perianth and solid crimson eye. Menadue, round overlapping white perianth and small white crown with the daintiest pale pink rim; and Bismarck, a bicolor trumpet of exceptional refinement, with much overlapping white perianth of very fine quality standing at right angles to the clear yellow trumpet, which is rather narrow, not over-long, and neatly reflexed; the foregoing all came from Mr. Williams, who, though quite at the end of his season, succeeded in winning some of the principal classes. A distinct and very attractive new bicolor, named Suda, raised by the Brodie of Brodie, was shown by Mr. J. L. Richardson and myself; this had white perianth, while the trumpet was a most beautiful tone of pale amber pink. Mr. Richardson also showed two magnificent Barrii varieties named respectively Therapia and Seraglio. They were of similar type, both having large flowers with broad, smooth, yellow perianth and shallow crowns edged with a striking band of scarlet. No. 11 T 127, from the same exhibitor, is one of the best bicolor incomparabilis I have seen, perfectly symmetrical in form and of smoothest texture and much substance, with pure white perianth and sharply contrasted rich yellow crown. Quartz, a flower raised by the Brodie of Brodie and shown by myself came in for much admiration; this is a white trumpet of great substance and really superb quality; and Nissa, from the same raiser,

THE FINE WHITE TRUMPET, QUARTZ.

is a bicolor incomparabilis of perfect show quality with rounded smooth white perianth of great substance and bright clear lemon crown. Among Mr. Cranfield's flowers I noted Kukri, a tall and smooth rich self yellow incomparabilis that had a suggestion of dark saffron colour; and Epaulier, rather short-stemmed and drooping, but a most distinct and striking flower with somewhat reflexing bright yellow perianth and large, long, bright orange-scarlet crown. In a group of twelve varieties of trumpets which won first prize I showed two very fine flowers raised by the Brodie of Brodie; one of these, Halfa, a pale bicolor trumpet bred from Queen of the West × White Emperor—a large flower carried on a tall strong stem with broad, perfectly flat and smooth perianth of White Emperor type, and slender soft yellow trumpet which has a beautifully reflexed and serrated brim; the other, Valetta, which gained an award of merit, is a pure white trumpet of great substance and waxy texture, the well expanded perianth standing at right angles to the trumpet, which is most gracefully and smoothly flanged.

Mr. F. H. Chapman, who always has something interesting to show, had several charmingly coloured seedlings, one of which, No. 8/9/12, had white perianth, the cup being cream with a band of coral surmounted by a distinct frill of cream, this again faintly tipped with coral—this was very charming; while No. 2/9/12 had white perianth with a delicate coral-coloured crown. Mr. Chapman told me that Crimson Braid was the pollen parent of these flowers, and added that this variety has given him many seedlings of great merit. He gained an award of merit for Samaria; this variety, raised by the Brodie of Brodie, is a very late-flowering, small-crowned Leedsii of good size, with very broad, perfectly circular, overlapping perianth of great substance and most wonderful smoothness and almost flat crinkled crown, milk white throughout.

Mr. W. F. M. Copeland of Shirley, Southampton, contributed an interesting group of seedlings, among which I noticed No. 1129, a very pleasing flower not unlike Mitylene, but with a rather flatter crown; and No. 1287, a round lemonade-coloured Leedsii. There were also examples of Mary Copeland, which is probably still the best double.

Among seedlings shown by Mr. E. T. England of Exeter, I was much interested in a beautiful white trumpet of well balanced form with fine broad smooth perianth. He told me that this was bred from Lady Margaret Boscawen × White Knight. What a wonderful parent White Knight is! GUY WILSON.

NOTES OF THE WEEK

ROCK CRESSES.

ALTHOUGH the ordinary Arabis albida is a useful plant in many ways and produces a perfect billow of white flowers early in the year, most growers recognise the superiority of the double-flowered kind for general use. Growing into a compact clump, plants look well the whole year, although the variegated single and double kinds are better in that respect, the foliage being prettily marbled in each case. All are the easiest of easy plants to grow; shoots nipped off with finger and thumb, and dibbled in, grow readily. A. procurrens is another white, not unlike the former kinds; the variegated variety in this case is very low-growing but a fine thing for creeping over rockwork. A. lucida variegata may be considered of much the same nature, the golden leaves growing into delightful compact rosettes. Dwarfer still and equally fine otherwise are the whites, AA. pumila and Sturii, small plants of which spread rapidly and cover the ground completely with a carpet of little leaves. Not all the rock cresses are white, however. A pretty little pink thing is A. aubrietioides, a neat, compact grower; A. rosea is a deeper pink, almost red, and is longer and more loose-growing; A. Billardieri is an improvement on rosea, while AA. androsacea and Sundermanni are the two lowliest, with red blossoms.—LANARKSHIRE.

HARDY TRADESCANTIAS.

SPIDERWORTS or hardy tradescantias will grow in any reasonable garden soil and flower profusely from early summer until late autumn. They are not at all gorgeous and showy blooms; they are distinct from all others and quite pretty, nevertheless, and will thrive in shade or in full sunshine. Lately we have tried some in a somewhat difficult corner of the rock garden; they have done quite well there where many other things failed.

The commonest tradescantia in the border is the species virginica, or one or other of the many varieties which are now sold. The type is blue with a suggestion of purple in it; there is a pretty violet kind, a rose red and a white, the latter being decidedly pretty. A double white and a double blue are also acquisitions, the former having quite full flowers and the latter being a delightful violet blue. Of other species, pilosa and congesta are very good, the rosy purple flowers of the latter being particularly striking. J. C. Weguelin is one of the newest; the azure-blue flowers are of large size and need an aspect in sunshine to bring out their full glory.—H. A.

ALYSSUM SPINOSUM.

THE thorny alyssum is comparatively uncommon in gardens; of course it is not so useful nor is it so attractive as the more common species and varieties of this dwarf genus, but it is a fine perennial for the rock garden, attractive and effective in a quiet way. It is rather low-growing and trailing in nature, but in a suitable sunny and dry spot it grows freely and forms a fine billow of foliage which is clothed in June and July with small white flowers. After flowering it is covered with stiff spines, hence the name. The foliage is silvery white and effective in appearance.—CLYDESDALE.

A DECORATIVE ROUNDED HUMMOCK OF ALYSSUM SPINOSUM.

TRITONIA PRINCE OF ORANGE.

CHARMING by day and glorious by night are the glowing flowers of this tritonia, I hardly think anyone will ever give up cultivating this plant if once they have had it. Its great beauty lies in its chaste colour, which is described as "glowing orange scarlet."

For an April and May display under glass T. Prince of Orange is *par excellence*. In colour alone the plants stand unique at this period of the year, while the flowers are most useful in a cut state—clean flower stems from 8ins. to 10ins. long being easily obtained without destroying the foliage of the plants. From four to six flowers are borne by each primary stem; four being the usual number fully expanded at one time—three being in perfect condition, while the fourth is fading; the top buds are the last to expand. When fully opened each flower measures almost 3ins. across, but most of the flower stems branch into two when 5ins. or 6ins. high, and thereby we get a greater number of flowers per corm. These secondary stems, as we might call them, attain to near the same height as the others, but never have so many flowers as the somewhat stronger primary stems.

Tritonia corms are flattish-shaped and a little less than an inch in diameter. While the plants are in full flower young corms are being formed; even at this date—end of April—these tiny growths, each slightly larger than a sweet pea seed—are clasping close the sides of the flowering corms.

Each plant has five grass-like leaves, the first pair are decidedly arched and much broader than those situated higher up the stem, which attains about 9ins. in length. The cultivation of tritonias is similar to freesias, that is, the corms, seven or eight in number, are set ½in. deep in 5in. pots, which have been well crocked and filled with a fresh mixture of loam, leaf-mould and sand.

The pots should be well watered then set in a cool glasshouse or frame, but introduced to an intermediate temperature in the winter. Not until the plants are well into growth should the corms receive much water, an occasional spray when the weather is fine is much better for the plants than keeping the soil over-damp. As soon as the growths get tall enough, each should be neatly staked and tied.

After flowering, continue to care for the plants, but gradually withhold water until the foliage withers, when the pots should be placed on their sides in a sunny position, so that the corms will be thoroughly rested and ripened. Afterwards they should be taken from the soil and when selected and sized are ready once more for repotting in September.—DAVID ARMSTRONG.

THE OLEANDER.

A Most Attractive Greenhouse Shrub.

THIS plant (Nerium Oleander), which is a native of southern Europe is quite happy in a cool greenhouse or conservatory and may even be placed in the open during the summer. A well grown oleander should produce its flowers over a season which lasts from June to October and, even when not in bloom, the elegant evergreen foliage makes the shrub attractive. It may be well to point out that the oleander is one of the most poisonous plants known and care should be taken to see that children do not eat the leaves. Oleanders are really easy to grow and yet it is a fact that many people fail to make the bush produce flowers freely. This is because the blossoms are only produced on mature and thoroughly ripened shoots. To secure these the plant must be fully exposed to sun and air throughout its period of growth, which is in the spring and early summer. Another point worth noting is that after the flowering season, oleanders should be given a rest for a month or two, by withholding water completely. On all other occasions these plants should be allowed plenty of moisture. At the end of the rest period cut the plants back; in the case of large bushes, hard pruning is desirable or these will become straggly and produce a poor show of blossom.

Frequent repotting is not to be advised for oleanders, but when a plant becomes very pot-bound, this step may be necessary. Then use a compost of loam and decayed manure in equal parts, carrying out the change in the spring.

Digitized by Google

The propagation of oleanders is readily carried out by means of matured leading shoots, inserted in single pots and placed in a close, warm frame. Another way is to root the cuttings in bottles of water and afterwards pot carefully in soil.

There are, of course, numerous varieties of Nerium Oleander, several of which are very distinctive. These have flowers in both the double and single forms and range in colour through varying shades of deep pink, light pink, saffron to pure white.—S. LEONARD BASTIN, *Bournemouth*.

CLEMATIS ARMANDI.

One of the Finest of Evergreen Wall Plants.

THIS is a most attractive species from central and western China and is worthy of more extensive cultivation, being very beautiful both in blossom and foliage. It is an evergreen climbing shrub of considerable vigour—when happily established it often attains a height of from 20ft. to 30ft.—being clothed with large trifoliate leaves, each leaflet ovate-lanceolate in shape, rather sharply pointed and of a deep glossy green. The flowers, which commence to open early in April, are borne in clusters of three or more on slender stalks rising from the axils of the leaves in considerable profusion. The individual flowers are about 2ins. in diameter and are composed of six or eight sepals which, upon opening, are creamy-white in colour, later changing to palest pink. It was introduced to this country by Mr. E. H. Wilson in 1900 and has proved itself to be moderately hardy, though to be seen at its best in any but the mildest districts it should be given the protection of a wall, which consideration it will amply justify.—A. G. FORSYTH.

LIBERTIA FORMOSA.

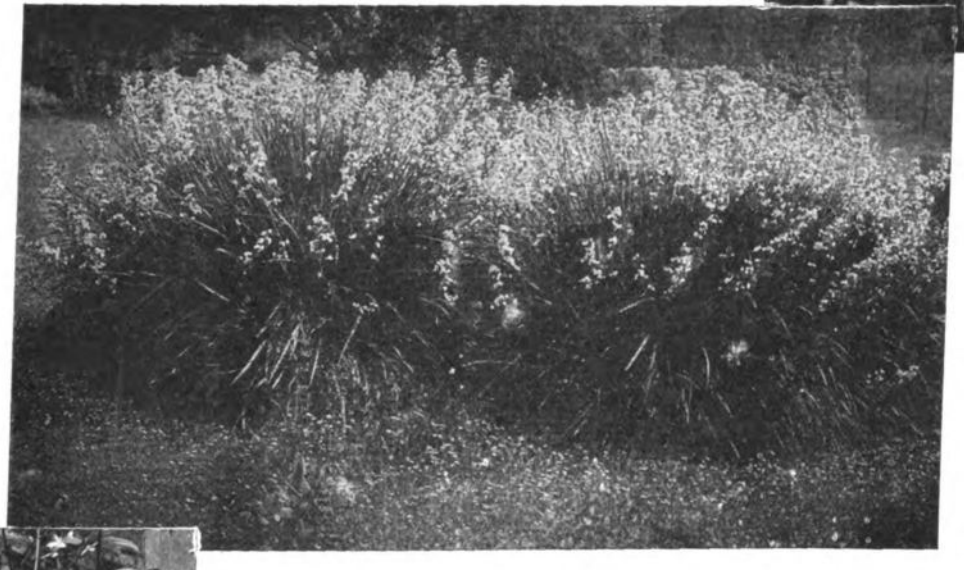
A Valuable Relative of the Iris.

THE libertias are beautiful plants of the iris order and are attractive throughout the year owing to the colour of their leaves, which are as green in the depth of winter as are those of the holly.

It is during May and June, however, that these interesting and free-growing plants reveal their greatest charm, for during that time sheaves of handsome flower spikes arise from the tufts of leaves to a height of 3ft. to 4ft., each carrying great numbers of snowy white flowers of considerable refinement and delightful for cutting.

Libertia formosa is a native of Chili and loves a warm sandy soil, which, in my opinion, is of greater importance than shelter, and healthy plants may be increased by division of their roots in autumn to any extent. It is perfectly hardy in most districts and is a rapid grower.

L. ixioides from New Zealand is also a pleasing and graceful plant with narrower leaves and small white blossoms. This plant is quite hardy in this part of east Sussex, but does not provide such a feast of beauty as the Chilian species here shown.—E. MARKHAM.



THE STRIKING FLOWER WANDS OF LIBERTIA FORMOSA THICKLY STUDDED WITH WHITE BLOSSOMS.

A DECORATIVE PILLAR PLANT.

A HANDSOME EVERGREEN CLIMBER.

RHODODENDRON EDGEWORTHII AS A PILLAR PLANT.

IN the conservatory or greenhouse it is often necessary to clothe a pillar with some climbing plant that is beautiful the whole year through, and if that pillar be in a cool and shady place, then no better plant can be found than Rhododendron Edgeworthii.

The beauty of the plant does not lie only in the large white to rose, sweetly scented, flowers, but also in the leaves. These are a very deep, glossy green, with deep veining, which causes a bright and pleasant play of light on the foliage.

Another feature of the plant is the tawny and ferruginous tomentum which is noticeable on the stems, as well as on the under surface of the leaves.

Although it is not perhaps so quick growing as the usual type of pillar plant, it is nevertheless well worth its place. It should be grown in a cool, moist atmosphere and in a shady part of the house, and if given good treatment will flower in the early part of May. Even when the flowers are over it will fulfil its purpose of clothing and beautifying what would be an otherwise unsightly and uninteresting greenhouse pillar.—S. F. OVENDEN.

THE CHILIAN WOOD SORREL.

A Choice Plant for a Sunny Position.

OXALIS ADENOPHYLLA, the Chilian wood sorrel, is again covered with flowers, which, when expanded in the sun, practically hide the lovely silvery foliage. Unlike its Falkland Isles and Patagonian sister, O. enneaphylla, it is a real sun lover, and to persuade it to flower well it ought to have one of the sunniest places in the garden. It appears churlish to speak of "persuading" it to flower, for, if given sun, it requires no further inducement to give us an unstinted bloom and to cover itself with its exquisite large pink blossoms. Some call the exact tint lilac-pink, but it is a warm pink, which gives a good plant such brilliant colouring in the sun that it shows a long way off as a glowing patch of colour. I have here a good plant growing on the level, between stones and with a little sand in the loam, and nothing could look healthier and happier. It has stood three winters unharmed by sleet, hail, rain, frost, snow, and all the other discomforts of this winter climate of ours, and

Digitized by Google

that without any overhead protection. It appears to like the sandstone with which it was surrounded and, with a piece of the same in the centre of the plant, now covered by the foliage, it is a picture of high charm, either when it only gives us its silvery foliage, or with its unopened flowers so carefully furled or, best of all, when it is glowing with these flowers, which open after the sun has rested for a little upon them. This year it began early in May and will bloom for a considerable time to come. I may add that O. adenophylla needs ample drainage.—S. ARNOTT, *Dumfries.*

CORRESPONDENCE

A TREE FAILURE.

SIR,—I was, indeed, surprised to read in your editorial remarks in THE GARDEN of June 12th that Araucaria imbricata must be considered "a dismal failure." To my mind, such criticism seems a little unjustified. It is true that it is not widely grown, perhaps, as you suggest, on account of its rather stiff and formal appearance, but on the other hand, I have seen many handsome specimens which lent considerable charm to their surroundings. I enclose a photograph of what, I think, is a fine clump of these stately trees growing in the policies of an estate in Scotland which is famed for its conifers, which well illustrates the fact that it keeps its lower branches intact when growing in a suitable position. In fact, there are few trees which present such a well groomed appearance. One of the striking characteristics of the tree is the graceful curvature of its bushy, tail-like branches, which in the mass present the most artistic of foliage traceries. It may be "a stranger which has lost its personality in its wanderings so far from home," but if it is, it is due to our lack of appreciation of its requirements. It is an exotic conifer which certainly deserves more widespread recognition in our woods and gardens and I hope that by your remarks you may have stimulated interest in an almost forgotten tree of our childhood.—OBSERVER.

THE FINE ARAUCARIA AVENUE AT BENMORE, ARGYLESHIRE.

SIR,—May I crave space for defence of the tree which is so ruthlessly dismissed as "a lamentable failure" in the Editorial on page 329? I submit that it has incurred this censure only from having been planted so often in the wrong environment. The genus araucaria represents an archaic form of vegetation. Like the cycads and the gingko (the latter having never yet been found growing wild), it is a survival from a very remote geological past. Its fossil remains have been recognised in the Jurassic rocks, which were laid down before the chalk and greensand. Small wonder, therefore, that the Monkey Puzzle should often appear harshly out of keeping with an English landscape, especially when stunted and blackened in a smoky atmosphere; but he would be, indeed, a fastidious critic who should withhold admiration from the stately avenues of araucaria at Bicton in Devonshire and Castle Kennedy in Wigtownshire. The group of araucaria at Beaufort in Essex is most impressive, as may be seen in the photograph given on Plate 20 in Elwes and Henry's "Trees of Great Britain and Ireland." The tallest of these in 1904 was 74ft. high. When the big tree at Dropmore died and was felled in 1905, it was 78½ft. high and 6ft. in girth under the bark.

It is not the Monkey Puzzle's fault that, as remarked in the article referred to, it does not often ripen seed in this country. It never fails to do so when it is given a chance; but, being, with very rare exceptions, dioecious (male and female flowers on separate trees), it can only bear fertile cones when grown in company of its kind. Moreover, the female cones take two years to ripen, the scales opening in the second year to receive the pollen, wind-borne from the male catkins. The seeds, 1in. to 1½ins. long, are excellent when cooked like chestnuts, which they resemble in flavour. Twenty years ago, happening to be at Castle Kennedy on the morrow of an August gale, I found the great avenue of araucaria thickly strewn with these seeds. I caused a bagful to be collected; we ate about half of them, and the rest were sown and I planted 1,250 of the progeny on a hilltop, where they form a landmark.—HERBERT MAXWELL, *Monreith, Wigtonshire.*

ARUM LILIES IN THE OPEN.

SIR,—Mr. Bastin's note on the above in THE GARDEN for June 12th should encourage others to plant these beautiful lilies by the waterside in the open. We have had them planted here outside in the water garden for years and frost has never spoilt them. After seeing them growing thus, one never appreciates them in pots again.

I remember years ago having to repot large batches of these lilies. We used to throw the surplus away, when they could easily have been planted in the pleasing way Mr. Bastin recommends, had one then realised how hardy they prove to be in the south.—R. MOORE, *Essex.*

POT-POURRI.

SIR,—Mrs. R. E. Head in an article on "Pot Pourri," in THE GARDEN of June 12th, differs from Culpeppers' opinion that melilot is "well smelling." I agree that the smell is generally rather offensive, but I once found a white melilot, growing near a private railway siding, which was delightfully and richly scented. Are there two varieties of Melilotus alba?—L. G. P.

AN EDGING PLANT.

SIR,—In the Correspondence columns of THE GARDEN for June 12th (page 339) there is a letter from H. Josephine Medley regarding one of the dead nettles and I consider the one referred to is Lamium maculatum aureum, of which I still have a few plants. The silver and green one sometimes sports from the golden one with me, but I discard it.—A. T. BROWN, *Surrey.*

THE RATTLESNAKE PLANTAIN (EPIPACTUS PUBESCENS).

SIR,—This charming little epipactis is worthy of a place in every garden where one has difficulty in covering ground under trees, especially coniferous ones. It has most beautiful evergreen ovate leaves, all growing from the base. These are of a dark bluish green, prominently marked with white veins, from which it receives its common name of "Rattlesnake Plantain."

It flowers in June and July, small white flowers curiously hooded in shape, on stems from 9ins. to 1ft. in height. It is a native of Canada, where it grows in woods in large quantities—a sight once seen not easily forgotten. It will thrive in dry places as well as moist ones, which is a great advantage.—ESSEX.

OLEARIA STELLULATA.

SIR,—This evergreen shrub from New Zealand has done exceedingly well this year and is still a mass of white flowers. It appears to be hardier than many gardeners suppose. With us the bush is 4ft. high. It withstood fifteen degrees of frost in Edinburgh, and has been in flower since early April.

I believe O. stellulata would be a good flowering shrub to grow high on the rock garden, in full sun, but sheltered from cold winds. It can be propagated from cuttings taken off in the month of September and placed in a cold frame. In spring the young plants should be lifted and potted up into 3in. pots, as the cuttings are very apt to make one long root if left too long in the frame and are thus difficult to transplant. The plants should be grown in pots for a season and planted out the following spring.—GEORGE STUART, *Edinburgh.*

HERBACEOUS FLOWERS AT VINCENT SQUARE

THE Horticultural Hall at Vincent Square, Westminster, contained the finest flower garden in England on the occasion of the fortnightly meeting of the Royal Horticultural Society on June 15th and 16th last.

Delphiniums were magnificent. Just inside the entrance, Messrs. Blackmore and Langdon had an especially good group. Their spikes were exceedingly tall and stately and the individual flowers were perfectly disposed on the stems. Their very best varieties were Edward Bromet, which is an improved Rev. E. Lascelles, Queen of Bath, Azure (blue), Mrs. Townley Parker, (clear Cambridge blue), Phyllis (a lovely silvery lavender) and R. A. Pilkington (rich violet edged with dark blue). Messrs. Kelway and Son, Messrs. R. H. Bath, Limited, and Mr. T. Bones also showed fine spikes of delphiniums. Mr. T. Bones had some of his good seedlings and we admired Blue Darling, Blue Bird and Luxor, of smoky blue shading.

An imposing group of delphiniums was arranged by Mr. H. J. Jones on a large floor space, where he set out tall spikes of the best varieties, including Major Pat Beckett, King of the Delphiniums, Glory, oan and Edmondson.

With their delphiniums Messrs. Kelway and Son had handsome herbaceous peonies, of which Dorothy Daniels (soft pink), Philip H. Miller (deep pink) and Anzac (rich ruby), of the single varieties were very handsome. The white Empress of India, Kelway's Queen, of blush shades, and Rose of Silver, of the doubles, were also desirable. In Messrs. Bath's collection the double varieties Baroness Schroeder and Albatross were especially good.

The peony competition for the silver cup offered by Mrs. Edward Harding was a little disappointing. Mr. W. B. Cranfield won the cup, and he included four good vases of Mons. C. Leveque, a large double blush, and Gloriosa, a fine crimson single.

Lupins were extensively displayed by Mr. G. R. Downer, and his L. polyphyllus varieties are very delightful and pleasantly fragrant, while he had many of bright attractive colours. Mr. Charles Elliott showed many spikes of his good strain.

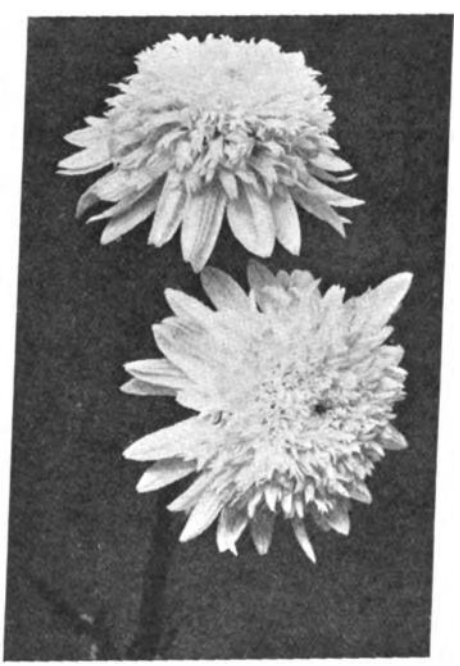
There were many examples of the valuable tall bearded irises of which the largest collection was that arranged in the centre of the hall by the Orpington Nurseries Company, where they grouped Flaming Sword of rich yellow and bronze shades. Sindj Khat, Zulu, Loreley and Sir Michael were also striking varieties. In another attractively arranged exhibit Messrs. Barr and Sons included Prosper Laugier, Lord of June, Montezuma, Juniata and Standardbearer among many other tall irises. They also had I. Xiphium varieties with various herbaceous flowers. The irises shown by Messrs. Waterer, Sons and Crisp included Ambassadeur, Prospero, Rhein Nixe and Memory; while Mr. Amos Perry added to his irises such valuable plants as Brodiæa coccinea Aster Farreri, Primula sikkimensis and alliums. An attractive group of the best June irises, delphiniums and peonies was arranged by Messrs. Bunyard and Co.

Several desirable varieties of Campanula persicifolia were massed by Messrs. B. Ladhams, Limited, which displayed their decorative value well. They also exhibited erigerons, heucheras and showy gaillardias.

Sir Oscar Warburg sent from his gardens at Boidier, Headley, Ascot, a unique collection of cistuses, which included nearly all the species, varieties and hybrids in cultivation, as well as various allied plants.

The gold medal collection of sweet peas so well arranged by Messrs. Dobbie and Co., augurs well for the success of the National Sweet Pea Society's Show at Cheltenham at the end of the month. It was a superb group and included their new Gleneagles, Ruby, Hawlmark Salmon Pink, Magnet, of beautiful pink shades; the picotee-edged Youth, Mary Pickford, of lovely cream pink colouring; and the bright pink Patience.

It is, with most growers, the betwixt and between season with roses, but the Rev. J. H Pemberton was able to show a good collection, chiefly of his musk-scented varieties. Carnations of great beauty were shown, as usual, by Mr. C. Engelmann, Messrs. Allwood Brothers and Messrs. Stuart Low and Co.; while Messrs. W. J. Godfrey and Son had another splendid collection of the show and fancy pelargoniums we admired at Chelsea; and Messrs. L. R. Russell,



PYRETHRUM VICTORIA.

Limited, set up an admirable collection of their stove plants.

There were several collections of orchids sent by Sir George Holford and four or five of the principal trade growers.

The alpines were rather overborne and outshone by the border plants, but Messrs. Clarence Elliott received a very well deserved award of merit for a superb pan of Phyteuma comosum. The firm also showed a new violet garlic, as yet unnamed, from Tibet (a very commendable little plant), besides the older Allium narcissiflorum, with drooping waxen bells, the colour of raspberry ice, and Viola elatior, a charming little dog violet from North America, white flushed with lavender.

Messrs. Waterer showed Convolvulus Cneorum, whose silver leaves and pearl-pink flowers are altogether desirable, but, coming from very hot, dry places in southern Europe, do not always survive our winters; Moltkia petræa, from the same part of the world, which is more resistant and makes hummocks of intense blue in a dry wall and the lilac pink Viola bosnaica, which should be everybody's plant.

Messrs. Maxwell and Beale showed Potentilla argyrophylla, with silver leaves and flowers of darkest mahogany red, perhaps a trifle small for the size of the plant; Geum Borisii, a splendid natural hybrid from the mountains of Bulgaria, and Geranium lancastriense, with large pink flowers delicately veined with red, which must be about the best rock garden plant that has come out of our native flora.

Messrs. Reuthe showed the very distinguished white form of Dianthus alpinus, Phyteuma comosum and Allium narcissiflorum.

Messrs. F. G. Wood showed Sedum pilosum, whose domes of pure pink flowers are unusually charming in a race whose flowers are so often dull or dowdy, and a pure white flowered form of Mimulus Lewisii.

Messrs. Rogers of Southampton showed Aster subcœruleus, with long narrow ray-florets of pale violet, drooping from an orange centre; Potentilla Tonguei, apricot blotched with crimson, dwarf and very neat; several plants of Armeria cæspitosa hardly as big as their flower heads and Campanula pulla, with its well known nodding flowers of deep violet.

NEW AND RARE PLANTS

ALLIUM SCHUBERTII.—Wide, spreading heads of this ornamental species were shown. It appears to be robust and tall growing and the flowers are of a dull purple colour. Award of merit to Mr. Amos Perry.

CALCEOLARIA JOHN COUTTS.—This is a splendid cross between the fairly hardy C. integrifolia and the more tender C. cana, and we should expect it to be valuable for summer bedding as well as for conservatory decoration. In general habit it favours the hardier parent, but in addition to its free habit it has derived sufficient of the grey tomentum from C. cana to make the foliage an attractive grey hue. From C. cana it also has pleasant fragrance. The flowers are a little longer and flatter in the pouch than those of C. integrifolia and are of a softer yellow colour. It is very free flowering. Award of merit to the Director, Royal Gardens, Kew.

DELPHINIUM VIOLET ROBINSON.—This stately variety bears the largest individual flowers of any delphinium we are acquainted with and it is very distinct in its rounded buds. The well disposed flowers are of a very dark blue colour with white centres. Award of merit to Messrs. Blackmore and Langdon.

DIGITALIS FERRUGINEA ROSEA.—In appearance this is much more like Chelone barbata than a foxglove. It has been raised from seed taken from D. ferruginea. The graceful spikes are from 2ft. to 3ft. in height and well furnished with relatively long-stemmed, tubular flowers, an inch or so long, of rose blush colour with yellowish interiors. The broadly lanceolate, glabrous leaves are similar to those of D. ferruginea. Award of merit to Messrs. B. Ladhams, Limited.

DIGITALIS LUTZ HYBRID.—This is a true foxglove in general habit and appearance. A tall, well disposed spike of pale salmon-coloured flowers was shown. Award of merit to Sir William Lawrence, Bt.

GYPSOPHILA BRISTOL FAIRY.—This, we believe, is an American seedling. It is a perennial and is a glorified form of the now well known double G. paniculata; the flowers are quite double its size. It produces a robust, widely spread panicle. Award of merit to Mr. W. Wells, Junr.

IRIS FRANCES GRACEFUL.—A pretty little iris, apparently of I. Delavayi type. The falls are of a bright velvety blue colour, lightened with golden lines at the base. Award of merit to Mr. G. Yeld.

PHYTEUMA COMOSUM.—This is of uncommon appearance, making a rounded little

Digitized by Google

plant of compact habit. The green, deeply toothed leaves are somewhat holly-like in appearance. The dwarf heads of flowers are of a dull, semi-transparent purplish colour, much swollen at the base of the tubes and the filaments are very prominent. It is a good plant for wall fissures on the rock garden. Award of merit to Mr. Clarence Elliott.

PRIMULA MICRODONTA APICOLA.—This is another of the many primroses collected by Captain Kingdon Ward. The pendulous umbels of flowers, which are carried on a slender stalk, are mealy. They are nearly as large as those of the common primrose, but are cupped and of deep violet-blue colour with primrose yellow centres. The flattish, glabrous leaves are similar in size and shape to those of our native plant. Award of merit to Lady Aberconway.

PYRETHRUM VICTORIA.—A very desirable double white variety of large size and very good form. Award of merit to Mr. Hubert Robinson.

RHODODENDRON NORMAN SHAW.—A very handsome, large flowered truss, much like a deep pink R. discolor, which has prettily waved margins to the flowers. Award of merit to Mr. Lionel de Rothschild.

SAXIFRAGA PRIMULAIZE SALMON.—There does not seem to be any accepted authority for the specific name, but it is an uncommon saxifrage of congested, tufted habit and bearing plenty of sturdy spikes of flowers which, with the stems, are of a reddish salmon colour. Award of merit to Messrs. M. Prichard and Son.

ORCHIDS.

ODONTONIA NUBIA.—This beautiful hybrid is the result of crossing Miltonia Charlesworthii with Odontoglossum Doreen, and well exemplifies the influence which Miltonias of the vexillaria section have over the odontoglossums. The young plant bore a couple of large flowers prettily marked with purplish crimson dots and confluent spotting, the labellum being the chief attraction on account of its broad development. Staged by Messrs. Charlesworth and Co., Haywards Heath. Award of merit.

DENDROBIUM PURPUREUM VAR. ALBUM.—An interesting species with stout pseudobulbs, which, in the leafless state, bear dense clusters of small flowers, each about three-quarters of an inch long and cylindrical in formation. Normally the flowers are bright purple, but in the variety album they are white tipped with green. In 1894 Sir Trevor Lawrence showed a white-flowered variety under the name of D. purpureum candidum, to which a botanical certificate was then given. A similar award was made to the present example, shown by Messrs. Sanders, and which probably came from the Moluccas.

FUNGICIDES FOR SUMMER USE

IN regard to treatment of fungoid diseases, nothing, at the moment, is more urgent than the necessity to spray potatoes *as a preventive measure* against attacks of the potato disease (Phytophthora infestans). Note the remark that spraying is to be reckoned as a "preventive" measure, not as a cure, for in common with the majority of plant diseases, it is practically impossible to effect a complete cure when once the filaments of the fungus have secured their foothold in the cellular tissues of the potato haulm; the one safe means of mastering the disease being to prevent the spores getting a start.

Rest assured, spores are abundant, and will be wafted about in the breeze from garden to garden and field to field during the last few days of June and the greater part of the month of July. Myriads of these spores, fortunately for us, come to anchor in situations and upon objects where they are doomed to perish without performing their destructive purpose, but it is all too certain that a proportion will alight on the young foliage and stems of growing potatoes, and here, they will simply await favourable atmospheric conditions—which are a combination of sun heat and moisture—to germinate and penetrate the inner substance of the leaves where the spreading parasite is out of reach of spraying chemicals and able to work its havoc, first on the leaves, then down through the stems and roots and finally into the tubers.

Copper sulphate is the chemical which has the power to dry up the spores of Phytophthora infestans, but as it is too strong to use by itself on soft, growing foliage, it is necessary to mix a certain proportion of lime with the copper the effect of which is to reduce the strength of the latter to an extent which renders it safe to use, while still retaining sufficient power to destroy the fungus spores.

The first essential is accurate balance between the copper sulphate and the lime, the mixture at its usable strength being generally known as Bordeaux mixture. Various proprietary brands of the preparation are put up in jars of convenient size for private garden use, and safety lies in making use of these ready-made mixtures rather than in endeavouring to mix one's own, a tedious, messy and somewhat risky business.

A really good spraying machine is the next requirement. It should be fitted with a fairly long lance having a double nozzle, so constructed that it can be turned upwards for spraying under the foliage, and downwards for spraying the upper surface, it being very necessary that every particle of both under and upper surface of leaves shall be completely covered with the spray.

In southern and warm districts about June 25th is not too early to commence spraying potatoes, and by the end of the first week in July, even northern growers should have their potatoes sprayed, otherwise there is a risk that when the labour is expended it may be too late to arrest the development of the first spores.

A point of vital importance is that just at this season potato haulm is growing very rapidly and in about a fortnight's time sufficient new growth at the extremity of every stem will have been made to throw the plants again into danger of infection. A second spraying, therefore, becomes necessary and on occasions when potato disease is rampant in a district it is sometimes well worth while spraying even a third time, quite at the end of July.

Many cases could be quoted of potatoes having been sprayed once only, and taking the disease after.

The phrase "it is well worth while," has been used advisedly. I wish it were possible to have shown every reader of THE GARDEN two experimental batches of my own last season. Both lots of seed from the same stock, planted in the same garden, treated identically except for the one point, that one batch was sprayed twice and the other left unsprayed. The sprayed crop was abundant, of fine quality and sound as could be wished; the unsprayed was fully 30 per cent. below weight of the other, and from the time they were lifted the tubers went rapidly from bad to worse, fully half the crop being rendered absolutely unusable long before Christmas. The sight of the collapse of so promising a crop of potatoes would, methinks, have convinced the most sceptical that spraying is, indeed, worth while.

July is the month during which roses should either be dusted with a dry sulphur spray or with sulphide of potassium liquid as a deterrent to mildew in its various forms. The liquid may discolour open blooms, but it is advisable to cut these previous to spraying, rather than to postpone the onslaught against mildew. Sulphide of potassium was dealt with in a previous article and the reminder is all that is now necessary.

Hollyhock rust is less virulent now that hollyhocks are more generally raised from seed, producing stock of more robust constitution than was the case when hollyhock fanciers persistently propagated their choice exhibition varieties from cuttings. Nevertheless, we are by no means free from the disfiguring fungus that spoils the handsome foliage of this stately flower. Here, again, moist, warm weather is favourable to the start and development of the fungus, and whenever such conditions prevail or when the very first sign of orange yellow spots about the size of pin heads is noticeable, antidotes should be used without delay. Bordeaux mixture may be effectively used, so long as the blossoms are not open, but one of the best cures or preventives of hollyhock disease is the rust cure, sold by Messrs. Vert and Son, Saffron Walden, the well known hollyhock specialists, who are the present day holders of the original and incomparable Chater's strain.

It is comforting to owners of small gardens and to amateurs who have but limited time to devote to such work as spraying, that several of the best known non-poisonous sprays possess fungicidal as well as insecticidal properties. Thus, where one has green fly, caterpillar and frog fly to deal with, as well as the commoner leaf diseases, a combined spray may be found extremely useful. Many excellent spray fluids are advertised in these columns from time to time, and any specialities bearing such names as Messrs. Abol, Limited, XL ALL (G. H. Richards, Limited), Robinson Brothers, Limited, Stonehouse Works Co., Cooper McDougall and Robertson, Tomlinson and Hayward, Limited, and Murphy and Sons, Limited, can be relied upon to give efficient service. L. I. ATKIS.

THE FLOWER GARDEN

STAKING GLADIOLI.

IT will be necessary to stake gladioli unless the beds or rows are sheltered. Even so, some of the very vigorous-growing varieties are liable to become top-heavy when in bloom, and to break or flop over, particularly when their heads become weighted by rain. The primulinus hybrids are not as heavy in their flower spikes and do not present such a wide petal surface to the force of the wind; therefore, staking is not of such great importance as with the large-flowering varieties. Those with whom the smaller and daintier primulinus are first favourites will recognise this point in their favour, for, apart from the extra trouble staking involves, the less one sees of stakes in one's flower beds the better, from a decorative point of view. There is, of course, no difficulty in staking each individual plant. A thin, but strong, stick or cane pushed into the soil near the corm and on the opposite side to which the flowers will face, a couple of raffia ties, one just underneath the bottom floret and another about 4ins. or 5ins. from the top, makes all secure. When growing them in rows, it is a simple matter to drive in a stake at each end of the row (one or more in between if the distance is considerable), then pass strands of string on each side of the row, fastening them to the stakes. As a further precaution, each spike may be tied to the string if thought necessary.—C H. A. S.

COLUMBINES.

Now is the Time to Sow.

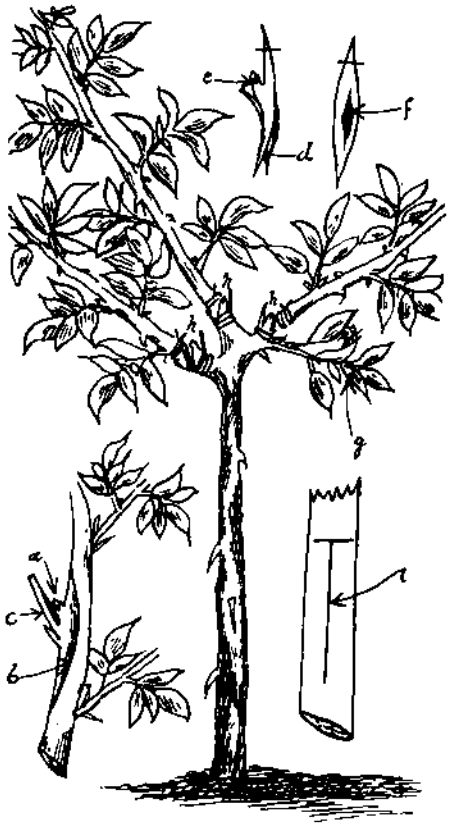
ALTHOUGH columbines remain at a high standard of excellence and purity for many years, growers realise that the utmost satisfaction can best be obtained by making a point of raising new stock every second year, or even every year. Seedlings are easily grown; many raise them in a frame; others, again, sow them in the open and get excellent results; while not a few discard orthodox methods and simply scatter the seed broadcast in any odd corner.

No one can gainsay the beauty of the long-spurred kinds. Although these are sold according to the dominant colour, yet I always like this flower best in a good mixed selection, for the colours harmonise and blend so delightfully. One bed of Langley hybrids is particularly fine, but the "ordinary" border is only a shade less excellent. I might mention, however, the superbs kinds, orange red and yellow, as well as Mrs. Nicholls, a rich blue, all being choice varieties of definite colouring. Growers should not wholly give their favour to the long-spurs. Even the old-fashioned blues and browns have their place in a semi-wild or wild border; and the dwarf alpina is really a pretty thing for a rock garden. A. glandulosa may also prove all right, though we ourselves have to grow it in pots.—LANARKSHIRE.

BUDDING ROSES.

THIS is a most interesting occupation, especially where the workman can have time to do the work thoroughly. Of course, the actual cutting of the bud and its insertion in the stock must be done quickly. Buds are formed in the axils of the leaves—between the leaf and the stem or branch of the tree. A very sharp knife is absolutely essential to success; the bark must be raised from the hard wood beneath it—only the bark should be cut through when the operator makes the incision for the reception of the bud. If the knife is not a real budding knife, then use a sharp-pointed piece of hard wood, such as that of the oak, for separating the bark from the wood: do not use the blade of the knife. If possible, do the budding during showery weather, on dull days or in the evening.

If branches containing the precious buds are brought from some considerable distance, then it is wise to have them wrapped in damp moss—not grass—and placed in an old tin box in preference to a wooden one. On receiving them immerse the branches in a pail or cistern of water, and allow them to remain in it quite one hour before taking off the buds. Even at home it is wise to place the ends of the cut shoots in a pail of water. The stocks to be budded and the trees from which the buds are to be taken should be thoroughly watered the night before the work is to be done. At this season of the year the wood is beginning to harden, so it will be



necessary to remove, with great care, the small piece of hard wood found immediately below the bud and the bark surrounding it.

The bud should be prepared first, then the hole in the bark into which it is to be placed and made secure. All the leaves should, first, be stripped from the branch, leaving only about 1in. to 2ins. of the leaf-stalk. The bud is shown at *a*, and it must be severed from the branch shield-form, as shown at *b*, retaining the stump of the leaf-stalk *c*. Then the two cuts should be made in the bark T-shaped, and large enough to contain the bark and the bud. If the top of the shield-like piece of bark is cut off, as shown by the cross lines, the bud will fit exactly into the T-shaped hole in the bark and allow the latter to be closed over it, making the bud quite secure. A few strands of worsted yarn or similar material should be used to keep the bark firm on the inserted bud. The yarn will collect and retain moisture during the night, and this proves beneficial to the bud. Just before the bud is inserted, the piece of hard wood, *d*, should be removed without injury to the base of the bud, *e*. The hard wood, when removed, leaves a small hole, shown at *f*. Insert the buds close to the stock and cut off such leaves or small shoots shown at *g*. The bud is shown at *h*, and the form of the T-shaped cut at *i*.—GEORGE GARNER.

TRAINING AND FEEDING ROSES.

AMATEURS are apt to spoil their roses from a lack of judicious thinning out of the excess of wood. The shoots should be carefully thinned, that is, all weak and blind shoots should be removed. Where two shoots start from one bud, one should be cut off. This thinning of shoots is best done at different periods. If too much is removed at one time, root action may receive a check. Hybrids require a good deal of thinning as a rule. Teas hardly need so much trimming. Climbing roses should be neatly trained, and any excess of wood thinned out when doing so. All roses should be kept clean and free from insect pests, so that the foliage and flowers may not be destroyed. A good spray consists of 2 oz. of soft soap dissolved in a gallon of water. Apply with a fine syringe or sprayer. Shoots or twigs may, where possible, be dipped in the wash.

Roses respond to doses of liquid manure. Before applying it, however, it is best to give the roots a good soaking with water. Frequent waterings with weak liquid manure are more effective than one or two doses of a strong manure. Poultry manure soaked in a tub of water may be used. Guano at the rate of an ounce per gallon of water is quite strong enough. Soot water is a splendid fertiliser for roses, but it must not be applied either too strong or too often.

In hot, dry weather a mulching of litter or grass mowings may be spread over the roots of roses. It is well to give a good soaking with water before applying the mulch. If the soil is caked on the surface, it must be broken and stirred with hoe or fork. To allow the water to sink to the roots the soil may be loosened with a fork by simply thrusting it into the ground and moving the handle backward and forward. Do not lift the soil.—J. W.

CHEIRANTHUS ALLIONII.

IT may not be known to everyone, even to those who have grown this Siberian wallflower, that old plants (or at least plants that have flowered), produce fertile seed abundantly. When the plants are left in their stations the seed will ripen, drop to the ground and eventually germinate. The seedlings will appear in hundreds in between and around the bases of the dried and withered stems of the old plants.

It may be interesting to state that early in February of this year, our seedlings—in the open—were only in the cotyledon stage. However, they were well sheltered and protected by the old plants which supported many dried stems and empty seed cases. At the end of May the young plants were 4ins. high and showing their green flower-buds.

In September of last year it was noticed that the orange and red flowers of Montbretia crocosmæflora blended beautifully with the charming orange blooms of this wallflower.

It will be seen from the freedom with which Cheiranthus Allionii multiplies that the cultivation is not a difficult matter, and that plants grow and flourish with very little attention. Those who have not yet grown this wonderful wallflower should sow seed now in the open border, and when the seedlings are sufficiently grown, set them out a few inches apart, so that robust plants will be obtained. These plants should flower in May and June the following year.—DAVID ARMSTRONG.

RANUNCULUS ACRIS PLENUS.

THIS plant, though old, is seldom seen in gardens. Perhaps it has been neglected, although it is stated in one catalogue to grow anywhere. Yet this graceful plant, with its rich yellow flowers borne on long, slender stems, is exceedingly pretty on a herbaceous border. It flowers in June and July at a time when, if we exclude the hemerocallis, yellow colour in the border is rather scarce.

The stems are from 2ft. to 3ft. high, strong, yet slender and sparsely foliaged. This is where the beauty lies, for the plant can be set nearer the front of the border, where another plant of the same height with more leafage would be entirely out of place. The Yellow Bachelors' Button is seen to marked effect when towering above the beautiful white pinks, as we had it several years ago.—D. A.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE KITCHEN GARDEN.

At this season we can look round and behold the results of our labours in the spring, but the keen gardener will not be idle, the hoe will be in constant use, and no weed must be allowed to produce seeds, otherwise there will be a crop of seedlings later on when the sun has lost some of its power. Parsley seeds can be sown now for a winter supply, and a sheltered position should be chosen, so that a box frame can be placed over the plants with a view to protecting them from winter frosts and snow. Endive may also be sown where this salad is needed for autumn and winter. As an opportunity occurs all kinds of kales, broccoli, cauliflower, savoys and cabbage must be planted, and the ground occupied by early peas, broad beans and potatoes can be filled with these vegetables as it becomes available. Aphis is very troublesome this year, and if the seedlings are infested with these pests, it will be advisable to dip them in a solution of weak quassia extract before planting. Thus treated, it is seldom that there is any more trouble. Another pest is a maggot which enters the stem of the plant, and a small hole is visible near the surface of the soil. If this is present, the roots and stems should be drawn through a mixture of clay and water, the former reduced to the consistency of thick paint.

Black fly is on some of the broad beans, and as this pest only thrives on the young leaves, the tops of the plants must be removed. A spraying of weak quassia extract will prove beneficial if carried out in the evening.

THE FLOWER GARDEN.

Garden Pinks.—This is a wonderful showy family of the genus dianthus, and this year, as always, they have been producing a grand display on the rock garden and in the borders. In time, however, the plants get old, and the quality of the blooms inferior, but, fortunately, this is easily remedied by propagation. Soon after the flowers are over a quantity of young shoots suitable for cuttings will be available, and these will readily form roots in a cold frame or hand-light, providing there is plenty of sharp sand in the soil. They will also root in a cool, shaded position outside. The growths are gently pulled off from the old plant, the ends neatly trimmed, and a few of the lower leaves removed.

OTHER FLOWER GARDEN NOTES.

At this season it is a good idea to set aside a cold frame for propagating purposes, which should contain a few inches of sandy soil. It would be ready for cuttings of various rock garden subjects as they become available.

The various forms of Phlox subulata are indispensable for the borders and rock garden, and the warm salmon rose variety Vivid should be in every garden. A stock of any variety can soon be obtained by taking cuttings after the flowering season. They will form roots in the frame described above.

Border Carnations will need supports, and coiled wire stakes are useful, no tying being required. If ordinary sticks are employed, they should be light and painted green. A certain amount of disbudding is desirable, and if the weather is dry give the roots moisture or the growths will be weak when the time arrives for layering operations.

Bulbs in Grass.—The foliage is nearly ripe, and now the grass can be mown to make the whole tidy. This will also enable the bulbs to become ripened.

THE FRUIT GARDEN.

Red and White Currants.—These will soon complete their season's growth, and summer pruning may be resorted to, so that the bu[illegible] will receive plenty of sunlight and the fruits benefit. The side growths are reduced to the fourth leaf from their base, but the leaders or main shoots are allowed to extend for another three weeks. If the trees are infested with aphis, care should be taken to cleanse them thoroughly before the fruit ripens. It is usual to employ a non-poisonous insecticide at this period. It is a good plan to grow a few examples on a north or east wall. They succeed well as cordons or fan shape, and where such is the case they should be pruned in a similar manner to bushes. Nets should be got ready and the trees covered before the fruits show signs of colouring, otherwise birds will soon strip the branches. Black currants, gooseberries, etc., will all need some protection from birds.

FRUIT UNDER GLASS.

Strawberries for Pots.—Wherever greenhouses exist strawberries in pots are a profitable crop, because ripe fruits can be secured in April and May without very much forcing, while the flavour is also good. To be a success, however, healthy, strong runners are essential, and the first runner from a young healthy stock must be secured. The new plants should be layered as early as possible, filling pots 3ins. in diameter with rich fibrous loam and then fixing the runner with a wooden or wire peg. Remove other growths from this particular shoot so that all the parent plant's energy is devoted to the young plants in the pots. If the pots are plunged in the soil, less labour will be needed in keeping the roots moist. As a rule runners are obtained from one year plants not bearing fruit, and with this object in view a small plantation should be made this season. The following year these plants produce a crop of excellent fruits.

Melons.—If autumn-fruiting melons are required, a sowing of seeds should be made at once, and directly the seedlings are large enough they should be transferred to their final quarters. The rooting medium consists of fibrous loam, which is made fairly firm before planting. Never allow the roots to become dry, or mildew will appear. Flowers of sulphur ought to be sprinkled on the affected parts when it is first seen.

THE VINERY.

In some vineries the grapes will begin to show signs of ripening, and directly the berries commence to colour a little different treatment is needed. Whenever the weather is bright and dry more ventilation is allowed, and both top and bottom ventilators can be used. An inch or so of ventilation throughout the night will prevent the berries cracking and improve the flavour. Give the border a thorough soaking of water, and no more will be needed until the crop is cleared.

In many gardens, however, where only one vinery exists and economy is practised in relation to coal, the berries will be swelling freely and perhaps just passed their stoning period. Here the roots will be active, and in consequence can be fed with an artificial manure, such as Thomson's or Le Fruitier. Soot water and liquid manure from the farmyard diluted to the colour of straw can also be applied with advantage until the ripening stage is approached. Feed the roots about once each week, and see that the border is moist before giving a stimulant. The atmosphere is kept fairly moist by sprinkling water on the floors, etc., twice daily, and if soot water is used for this purpose occasionally before closing the house for the night it will help to maintain the foliage in a healthy condition. Ventilation will need attention, and the ventilators should be opened a little before the temperature rises to any great extent, thereby preventing the foliage being scorched. When closing the vinery in the afternoon a note must be made of the sun and not the clock, and some days it will not be safe to shut up before 5 or 5.30 p.m. The position of the vinery ought also to be considered. As a rule the house is damped down and the ventilators closed sufficiently early for the temperature to rise from 10° to 20° before sundown. All lateral growths are pinched as they appear, and a watch must be kept for mealy bug or the bunches will be spoilt. Methylated spirit placed on this pest with a small camel-hair brush is most effective.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE ROCK GARDEN.

Since the finishing off of the spring planting, work in the rock garden has mainly consisted in keeping it free from weeds, removing spent flowers and dead leaves. The advent of July ushers in a time of interesting and speculative operations on the matter of plant propagation. Three ways of increase are possible, two of which give plants similar to those we start with. The other, because of the probability of "something new," introduces the element of chance with its pleasant anticipations. To increase the plants already in our possession the easiest and quickest method is by division. This amounts to lifting the plant, dividing it into two or more portions with roots attached and replanting them at once with every hope of success, providing a suitable time is chosen. A few of the kinds that may be increased after this method are the campanulas, saxifrages, sedums, sempervivums, etc., most of which have a tufted habit. The following do well from cuttings: Aubrietia, alpine phlox, dianthus, helianthemums, cistus, veronicas and Lithospermum prostratum. The cuttings from aubrietia, alpine phlox, etc., are taken about 4ins. long and prepared in the ordinary way, while others which have firm woody shoots are best pulled like garden pinks, removing a few of the lower leaves without further trimming. This work may be done as the plants go out of bloom, from mid-July to late September. The necessary materials are well drained pans, soil of a light gritty nature—two parts loam, one each of rough sand and leaf-mould—and a suitable frame. This latter filled three parts with sifted ashes in which to plunge the pots and help to maintain an equal degree of moisture. Seeds of alpines are best sown when harvested. If kept in packets the skin hardens and germination is delayed. The compost for seed sowing should be the same as for cuttings, with the addition of crushed mortar rubble, sandstone or bricks. Fill the required number of well drained pans, coarse portions to the bottom and fine compost on top, and water with boiling water to destroy vegetable and insect life. Allow the pans to drain and cool, then sow the seed, covering with light soil or sand to a depth varying according to the size of the seed. Some very small seeds are not covered at all.

THE ROSE GARDEN.

In average seasons July is the month of roses, and exhibitors will be busy selecting cutting and showing their roses. For the ordinary grower of roses work will be mainly routine. Feeding should be discontinued towards the end of the month. The second growth is usually stronger than the first, the stimulus of applied feeding may have an adverse effect in promoting growth that would fail to ripen properly.

Mildew is likely to be troublesome at this period. As wet spraying is prohibited, dry sulphur powder from a distributor over upper and under surfaces of leaf or a little rubbed on the spot with thumb and finger will check it. The same agency will be disastrous to colonies of aphides on the points of the shoots. Remembering that the tender basal growths of the climbers are the flowering shoots of branches of the following year, these should be attended to by slinging them out of harm's way with a piece of soft string or raffia.

Suckers among growing roses are offensive apart from their parasitic tendencies. They should be pulled out in their entirety if possible as pieces left will grow afresh.

The picking of spent blooms should be done regularly for the sake of tidiness and as a relief to the plant. Hoeing the beds should not be neglected and watering must be done if the weather is very dry.

GARDEN TECHNIQUE

FRUIT AND VEGETABLES

FRUIT TREES.

Hints on Summer Pruning.

THE summer pruning of fruit trees is a matter to which all growers should pay attention. Of course, the business must be undertaken with care, for the reckless cutting away of all the green twigs will do harm. At the same time, if this summer growth is allowed to develop unchecked, damage will also result. The correct method of pruning an apple tree in summer will be somewhat on these lines. Divide the process into two parts, dealing first with the strongest portion of the tree, usually the top, and with the weaker half two or three weeks later. It is a good plan not to start the pruning too early, as the tree benefits by having the large amount of leafage, for a time, at any rate. Round about the latter part of June and the beginning of July will, in most cases, be about the right time. Established pear trees that have settled down into regular bearing rarely produce much in the way of superfluous growth. Such pruning as is attempted should be concerned with letting the light into the various parts of the tree and generally controlling the balance of growth as a whole. When there is any gross attempt at growth, this should be stopped before it has a chance to rob the more useful adjoining branches. In the case of plums, summer pruning will begin when the shoots are an inch or so long, by thinning the clusters, removing the weakly shoots altogether which cannot be of any use to the tree. This work may be repeated during the summer, as needful, and right up to the end of the growing season the trees will require attention.—L. B.

SUMMER TREATMENT OF CORDON PEARS.

CORDON pear trees may be grown in large numbers in quite small gardens. It is not necessary to have walls on which to train them, as really fine specimens may be grown in the open borders trained to wires, of course, or supported by neat, strong stakes. The cordon system of trained pear trees enables a cultivator to grow many varieties in a small space. This being so, it follows that the character of growth will be varied too, and the treatment must be suitable for each. To refer in detail to sorts would mean a lengthy article, so I can only give a general guiding hint here. It is past early summer and new shoots are approaching full strength. Some will be much stronger than others. It is very essential that we summer prune cordon trees. This work should be done between the third week in July and the middle of August. Very strong-growing varieties, such as Pitmaston Duchess, should not be pruned as hard back as the less robust-growing ones, such, for instance, as Durondeau. The current year's shoots of the latter may be pruned back to five buds from the base; the strong sorts should be pruned back to six and seven buds. In cases where the growths of any variety are extra strong partly break off the shoots and allow them to hang for ten days or so before cutting them clear. This is to avoid a big check to growth. Do not feed the trees for about three weeks at this time, but the surface mulches may be renewed, if necessary.

Manure should be applied to young trees very sparingly and feeding should be avoided except in cases where the soil is very poor. But in every instance the surface mulch will be beneficial, especially to young and recently planted trees, as the mulch keeps the soil in a consistent state of moisture. The present is a good time to note trees that would be benefited by root-pruning in due course, and all such should be marked. As the wind has most power on trees when in full leaf, the necessary supports and ties should be examined and made good where deficient.—G. G.

CLIMBING FRENCH BEANS.

Why They Should be Grown.

IT is somewhat singular that among a hundred who grow dwarf French beans every year, scarcely one is to be found who sows climbing French beans. Canadian Wonder as a dwarf is universally popular, and, for the reason that it comes in early is valued, but for heavy croppers I have not found them to excel Early Bountiful, The Admiral or Tender and True. If these are sown in richly manured ground and given not less than a minimum space apart of 9ins., one can expect to gather many baskets of the climbing French sorts crop for a longer period. I find that if they are given the support of dwarf pea sticks—say hazel sticks about 4ft. in height, one can almost ensure a greater output than from the orthodox dwarf French beans—good as they admittedly are.—CLAREMONT.

GLOBE ARTICHOKES.

THIS herbaceous perennial vegetable is not grown extensively in small gardens because the plants occupy much space, and, in many large gardens too little space is devoted to it. Frequently, one finds plants growing in very poor soil, too; they will grow in almost any kind of soil, but mere growth is not sufficient; there must be very strong, luxuriant foliage with the globe stems high above it, then the scales forming these globes will be large and very succulent, not, as is often the case, small and dry, almost woody. Old plants are bound to lose strength, however well fed, so it is advisable to raise stock every two years to maintain a strong plantation, not necessarily replacing all the old plants every two years, but the weakest of them. When this is done some of the old soil should be taken out and wheeled to another part of the vegetable garden, new loam and rotted manure being liberally used to replace it. Towards the end of April sow some seeds in drills in a prepared bed of soil. The drills should be 18ins. apart, the seeds dropped thinly and the resultant plants thinned to 15ins. asunder. The plants will fill the space by the end of the year and be available for planting out next April. Permanently planted artichokes should be richly top-dressed and well fed during the summer months.—HANTS.

POTATO FOLIAGE DISEASES.

THE potato, our most important vegetable, is in rather a precarious position at the present time. I hasten to state that there is no need for immediate alarm, but growers realise that the outlook for this crop is not by any means as "rosy" as it ought to be. Every man who raises potatoes should realise that a diseased plant generally implies small tubers; small tubers are often selected for seed and seeds carry the diseases. My advice, therefore, is to watch a crop and dig up at once a diseased plant, burning the haulm, and using or burning the tubers at the root. Not one disease can be cured by spraying, though spraying may prevent the spreading of trouble, and so I emphatically state that only by conscientious energy on the part of every grower can the ravages of disease and the deterioration of varieties be prevented.

Digitized by Google

Below are briefly enumerated ten diseases easily identified this month or next. Worst of all is the first and, as everyone knows, Bordeaux mixture should be employed against it in June or July in order to prevent it doing serious damage.

Disease, or Blight.—Brown patches on leaves, peculiar curling, leaves and stems turn black, strong smell of decaying foliage.

Collar Rot.—Plants look sickly, stems covered with a grey mould.

Sleepy Disease.—Plants wilt, droop and slowly die.

Bacteriosis.—Leaves wilt and shrivel, the tissue turns brown, dark lines on haulm right down to the roots; brown marks inside stem when it is cut.

Leaf Blotch.—Leaves develop brown blotches, then they turn black and die.

Leaf Curl.—Leaves curl up, turn yellow, stems wilt, lower leaves attacked first.

Leaf Spot.—Greenish yellow spots running together, with violet mould underneath; often mistaken for disease, or blight. The spots may become brown.

Black Leg.—The leaves wilt and turn yellow, then die. Underground stems badly stained at first, but this soon extends up the stem, which finally becomes black and rotten.

Mosaic.—A peculiar marbling of the foliage with faint yellow blotches, seen better when the leaf is held up to the light; no great loss of vigour apparent, but the tubers are small.

Wilding.—This may not be a disease, but simply reversion of the plant to a wild state; growth is often abnormally vigorous, but the tubers are usually small and poor.

I urge readers once again to "rogue" their plots several times during the season, so that the crop harvested in autumn may be clean and pure. Knowing these ten diseases and remembering that there are at least as many diseases which are not apparent in the foliage, everyone will now realise how much the future of the potato depends on concerted action.—CLYDESDALE.

MISCELLANEOUS

MILDEW.

How to Keep it in Check.

AS most people know, mildew is a popular name applied to a number of microscopic fungi which cover the leaves of plants, on which they are parasitic, with a meal-like powder. As far as the open air is concerned, mildew is most prone to appear on roses, although, in one form or another, it may attack other plants. The condition which favours the development of mildew is a moisture-laden atmosphere, especially if the temperature is high. Such a state is very likely to occur in the early part of the season, and at such times the grower should keep a sharp look-out for the first signs of the trouble. Examine the foliage of roses repeatedly, and never delay treatment. There is no better cure for mildew than dusting the leaves with flowers of sulphur. The sulphur, brought into contact with the spores of the fungus, does its work well and at once checks the spread of the disease. The sulphur is best applied through a special blower and, as a rule, several applications are needed. Deal with all the affected areas and, in severe cases, it is sometimes needful to remove some of the foliage altogether; this should always be burned at once. Mildew is such a serious pest that it is worth while taking preventive measures. A very good solution, which protects the plants, is prepared by dissolving 1 oz. of liver of sulphur in 2½ gallons of water. This should be sprayed on to the foliage as early in the summer as possible, and the process may be repeated at intervals. Even after this step has been taken, mildew may appear in close, thundery weather, and one should always be ready to attack the spots with flowers of sulphur, in the manner described.—S. LEONARD BASTIN.

WINDOW PLANTS.

The Need of Care in Summer.

IF regularly watered and the foliage kept clean and free from insect pests, etc., window plants will look their best and grow vigorously. Cleanliness is, indeed, the main point, and even in a smoky district, window plants may be kept in splendid trim if they are frequently sponged or syringed. The free use of the sponge and the watering pot with a fine rose on it afford the best means of keeping plants clean. As the weather becomes warmer and the sun stronger, watering will require to be done more frequently. Any neglect in the regular performance of this little duty will soon tell.

Plants that are difficult to water may be stood in a pail of water for a while. It is always advantageous to moisten the soil thoroughly now and again, but no plants should be kept constantly sodden, nor allowed to stand in stagnant water. If the fine rootlets of plants in pots do not get sufficient moisture they soon wither up. This may not be reflected in the foliage just at once, but it will assuredly tell against the appearance of the plant before long. Plants are perceptibly freshened if a few pieces of charcoal are put into the water used for watering. A little soot is good for darkening the foliage of many house plants.—J. W.

SWEET PEA COMPETITION

£50 IN PRIZES

RULES.

A list of your choice of the six most popular sweet peas to be sent in in order of preference on the coupon to be found on page IV of this week's issue of THE GARDEN. *No alternative* varieties will be allowed in the one list, but readers may send in any number of lists, provided that they are written on the special coupon to be found in this and the following issues of THE GARDEN.

Coupons must reach this office not later than Saturday, July 17th (after which date no coupons will be accepted).

The popular vote will be final, and no correspondence will be entered into over this competition.

Envelopes must be marked *Competition* and addressed to THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

The Editor will not be held responsible for letters missing in the post.

The result will be announced in THE GARDEN in the issue of August 28th.

The prizes are awarded to those whose list corresponds most closely to that arrived at by the popular vote.

If two readers tie for the first place, the first and second prizes will be equally divided; if two for the second place, the second and third prizes will be equally divided.

The Editor's decision on all points will be final.

PRIZES.

1ST PRIZE.—Goods worth **£30** from any advertiser in the pages of THE GARDEN.

2ND PRIZE.—Goods worth **£10** from any advertiser in the pages of THE GARDEN.

3RD PRIZE.—Goods worth **£5** from any advertiser in the pages of THE GARDEN.

20 CONSOLATION PRIZES of **5s.** each from any advertiser in the pages of THE GARDEN.

Red Spider, Thrips, Black and Green Fly, Mildew, Rust and all Fungoid and Insect Pests are killed with one application of the

FERRY BRAND (Reyd. Trade Mk)

INSECTICIDE (Non-Poisonous)

Here is the opinion of a user:

"Kingsclere, Newbury.

"I am writing to testify to the good quality of your Insecticide.

"I had the Black Fly very badly on a crop of Broad Beans, but one single application cleared the plants of every trace of Fly and now are quite clean and healthy and have a good crop of Beans on them. I would recommend anyone to use it, also your Antiseptic.—A. C."

A Book for all Fruit Growers

SUMMER PRUNING

The Lorette System of Pruning.

By LOUIS LORETTE (Late Professor of Arboriculture). Translated from the French by the late W. R. DYKES, M.A., L-ès-L., the late Secretary, Royal Horticultural Society.

Illustrated with many full page illustrations and smaller blocks. Demy 8vo. Cloth. 7s. 6d. net.

"For some thirty years M. Lorette has been growing fruit on a system of pruning revolutionary in character and on its own ground producing astonishing results . . . the principle of the method is the formation of short fruiting spurs close to the main limbs of the tree by an exact routine of summer pruning with the knife . . . the many photographs in the book prove what a prodigious wealth of bloom and weight of fruit can be produced by the method."—

VOL. XC.—No. 2848. JULY 3, 1926

DEAN HOLE AND HIS ROSES

BY countless thousands of folk who have only a slight interest in gardening, the rose maintains her long earned reputation as the Queen of Flowers, and to them she represents the highest ideal of beauty to be found in an English garden. To others who cultivate her she exerts an irresistible attraction, so that to-day, more than ever before, the number is legion whose gardens are enhanced with roses. This is a great year with growers everywhere, being the Jubilee of the National Rose Society, many of whose members, scattered throughout the kingdom, will doubtless do homage by attending the exhibition. Looking back over the years one is amazed at the rapid increase in membership of the Society, and, in this month when most of us gather our first blooms, we cannot help thinking of the great debt we owe to those pioneers whose skill and patience evolved the varieties, some of which are with us yet and enjoy a measure of popularity. One recalls some of the well known names of growers in the rose world, who, as long as roses bloom, will ever be held in respect—William Paul, the introducer of Carmine Pillar; Turner, of Crimson Rambler fame; George Mount of Canterbury; and old Ben Cant of Colchester—to mention but a few. Many of the clergy in the early years of the society evinced special interest in roses; they encouraged their cultivation, some with their writings, like the Rev. H. B. Biron. The National owed its inception largely to the Rev. H. H. D'Ombrain, who became its first secretary and for its first president it was fortunate in its choice of the Rev. S. Reynolds Hole, who, first at Caunton and afterwards as Dean of Rochester, grew to perfection the flower he loved so well. Every rose-grower who has read his "Book About Roses" knows well the axiom which he laid down and put into practice: "He who would have beautiful roses in his garden, must have beautiful roses in his heart. He must love them well and always."

OUR SWEET PEA COMPETITION

£50

IN PRIZES

(See page vi.)

These lines are as applicable to the grower of roses to-day as when they were first penned. I remember him, first as Canon Hole of Caunton, where, in his beautiful garden, he startled some of the orthodox growers of teas who treated them tenderly and cultivated them in pots under glass, by demonstrating that they were not the delicate race as so many regarded them, and produced from outdoor bushes blossoms that were the admiration of all who saw them. It may be said that, as a result of that experiment, and from that period, the old idea that "tea roses are par eminence the roses for culture under glass, and form a touchstone of the rosarian's skill" as one writer of the day described them, fell to the ground, for the outdoor cultivation of the varieties of the Canon's time received considerable impetus. Some of them will be remembered —Mme. Falcot, Belle Lyonnaise, Devoniensis, Mme. Bérard, Souvenir d'un Ami, Rubens, Catherine Mermet among them.

Dean Hole had a winning personality, and was a great favourite with working-men gardeners in and around Nottingham; in fact, he took as much interest in roses blooming in allotment gardens as he did when looking at the superb pans of cut blooms at the Temple Show.

I do not remember anyone who had the gift of creating enthusiasm more than he had. In the early days of his residence at Caunton he acted as judge on occasions at shows in the county. To have a chat with Dean Hole about roses was an education. To be in his company was a delight, and to no body of men was he more welcome than garden holders.

Dean Hole was thorough; he was not merely a summer gardener, but tended his rose trees in equally careful fashion in the late autumn, when some of them needed slight protection or special attention. He lived at a time when roses were few in comparison to the number we have to-day, when such varieties as Gloire de Dijon, Jules Margottin, Général Jacqueminot, Charles Lefèbvre, Alfred Colomb and Duke of Edinburgh were looked upon as the best. One wonders what the Dean would have said to the work of present-day raisers like the late Mr. McGredy, who gave us glorious varieties such as Golden Emblem, Mrs. Henry Morse, Una Wallace, Mrs. Charles Lamplough and those equally glorious singles as represented by Mrs. Oakley Fisher, Isobel and Irish Fireflame. Or what would he have thought about the work of others, the creators of Betty Uprichard and Ophelia; of Hugh Dickson, whose J. G. Glassford has been honoured in several directions; and of the charming introductions of Alex. Dickson and Sons? Dean Hole was a frequent visitor to exhibitions where roses were shown, and it is largely due to him that many commenced rose cultivation. As he was the first amateur rosarian to grow teas out of doors, it was not long before others followed his example, which until that time had been in the hands of the comparative few who owned glasshouses. Had it not been for the Dean persisting in his efforts to grow teas under hardier and more natural conditions than those which obtained in his day, it is obvious that we should not be in possession of the large family of hybrid teas in this, the jubilee year. He laid the foundation, so to speak, of a more glorious race than he ever knew or dreamed of. He was in love with the old Gloire de Dijon—so much so, that he tells us facetiously, in that oft-quoted paragraph in his book, "if ever for some heinous crime I were miserably sentenced for the rest of my life to possess but a single rose tree, I should desire to be supplied on leaving the dock with a strong plant of Gloire de Dijon."

W. LINDERS LEA.

WORTHY PLANTS.—VI

RAMONDIA PYRENAICA.

AMONG the many beautiful alpines which are to be had for the decoration of the rock garden, there is none more worthy of a place than the dainty Ramondia pyrenaica. As Farrer remarks, it is a noble species and very old in cultivation. There is no other alpine exactly like it with its rough, hairy rosettes of leaves which fit tightly into vertical rock crevices and its graceful lilac blue flowers with their dash of gold in the eye, borne three or four together on the stems. There are numerous colour forms, but the type as found on the slopes of Gavarnie in the Pyrenees is by far the best. It is not a difficult doer, and is especially suited to rocky faces with an aspect of north to east, so that it gains a certain amount of necessary shade. It is easily propagated either by division of existing clumps or, more readily, from seed.

THERE is little doubt that the second show for amateurs held under the auspices of the Royal Horticultural Society at Vincent Square on June 22nd showed a decided improvement on the inaugural one of last year. Everywhere in the hall there was evidence that the amateur exhibitor was trying in a small way to emulate what is to be seen every fortnight at the trade shows, but at the same time there did not seem to be a whole-hearted attempt made to stage really first-class exhibits except in a few cases. In many smaller provincial amateur shows the standard is higher, so that, in a way, there is still considerable room for improvement. It was unfortunate also that the exhibits had not been better arranged. Some corners were crowded, others were bare, and the resulting chequered appearance did not make for harmony in walking round. These Amateur Shows would seem to indicate that there is need of some system of educational propaganda to teach the amateur how to arrange and show his produce to the best advantage. There is no doubt that the material is there to [illegible], and that there is no reason why the Amateur Show of future years should not at least be as good, if not better, than the shows which we are accustomed to view at Vincent Square. A supposed feature of this year's Show was to have been the exhibit of peonies by several amateurs from America. These were, frankly, a failure. We have come to regard American gardens as the home of the peony and probably expected a higher standard than is reached with this flower in our own gardens, but certainly this was not the case, to judge from the exhibits. Naturally, the difficulties of transport and the long journey must be taken into consideration, which would account for the number of blooms being still in the bud state. What was surprising was that a few flowers, such as the blooms of Mme. Crousse, were in perfect condition and others, which presumably travelled at the same time, were over and still more were in bud. The American amateurs deserve every praise for their enterprise, and we may look forward next year to more successful exhibits once some experience in transport has been gained. Nevertheless, it would seem that the British amateur can hold his own with his American cousin even when comparison was limited to the best blooms.

NOW that the holiday season is at hand and all plant lovers who have the opportunity are scampering across to the Alps, a word of warning should be given regarding the actual collecting of alpines. Much needless destruction of plant life is caused by careless digging and by the use of makeshift tools and packing equipment. Always make a thorough job of lifting a plant. Cut clean with a sharp trowel, the longer the better, and do not hack away and so destroy the surrounding plants and often the roots of the plant you are lifting. Always try to lift a larger ball of soil than is absolutely necessary. Once in the hand this can be pared down without damaging the roots. Always pack the plants as tightly as possible, so that the roots do not suffer from undue exposure to the air. Care should also be taken not to collect plants that are either of extreme rarity or which are difficult to grow at home. Do not bring home large clumps of Eritrichium nanum unless you are an experienced gardener. It is better to leave it growing on the Alps than have it die in your garden. The losses, particularly among the tinier and rarer morsels, are severe once they are removed from their native homes. The lifting of wild plants is not so easy as many imagine, and to be successful requires neatness of fingers and considerable patience. They are worth care and patience and will thrive the better in your gardens for kindly treatment during the process of removal.

A MEETING of the Iris Society of England was held at the Grosvenor Hotel on Wednesday evening, June 16th. A motion supported by Sir William Lawrence, Bt., Mr. G. P. Baker, Mr. George Yeld and others that a Dykes Memorial Fund should be instituted by the Society for the purpose of commemorating the great work carried out by Mr. Dykes on behalf of the genus iris met with unanimous approval. A medal was suggested, but the details were left for further discussion at the next meeting. Mrs. Dykes was elected a life honorary member as a small but genuine expression of the gratitude of the Society towards one whose name would rank with that of Sir Michael Foster as having had the most potent influence on the cultivation of the genus in his generation; whose knowledge of it was unfathomable, and whose enthusiasm was unbounded. Certain points regarding the method of conducting the iris trials now taking place at Wisley were then discussed. It was resolved that, in addition to the periodical inspection made by the joint committee of the R.H.S. and Iris Society, a general meeting of the society should be arranged to take place at Wisley during the flowering season. Several members who had recently visited the trial grounds reported that very successful growth had been made, and that the varieties on trial were looking exceptionally well. It was also resolved to endeavour to arrange an iris show during the first week in June, 1927, to be held at Vincent Square. In his concluding remarks the president impressed on the meeting that, despite the growth made by the Society since its inception, it was necessary to increase its membership considerably if it is to keep its place as a progressive combination, active in the advancement of the genus to which the Society is devoted.

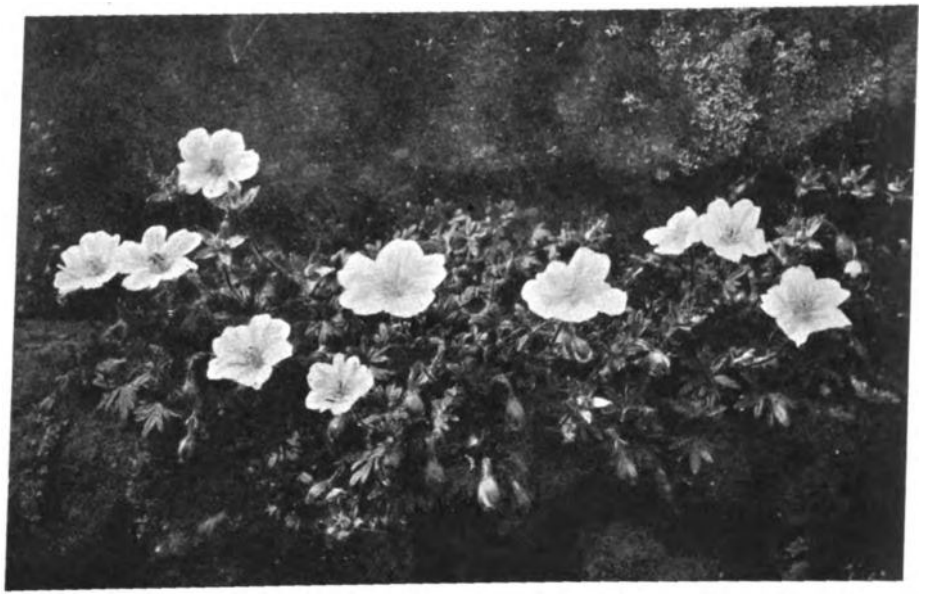
A PLEA FOR THE HARDY GERANIUM

IN making a brief appeal for a more general recognition of the hardy geraniums, I am moved by the fact that there is no other race of herbaceous plants which, viewed from all points, have given me as much pleasure and satisfaction as these cranesbills. At one time they were doubtless more popular than they are to-day. But they had no place in the "turgid mosaics" of Victorian and later days and went out. Some have come back again, a few have become almost lost to cultivation, others are lingering in out-of-the-way places. But now that we are realising the great charm of the mixed border, the woodland and wild garden, and exercising more natural and rational methods of using ornamental shrubs, these hardy geraniums are justified in demanding our fullest consideration, since for all those and other phases of modern gardening they are admirable subjects.

One of the most commendable attributes of these cranesbills is their amiable and contented dispositions. With few exceptions all are sound and hearty perennials. They will thrive in any average loam and, though naturally sunlovers, most of them do very well in shade. Tree-drip they do not resent and they are practically pestproof. As for attention, they rarely ask for anything beyond lifting, dividing and replanting every three years or so and many do not need even that. The majority of them set seed freely, and increase is easily carried out by open ground sowing during summer.

THE ELEGANT GERANIUM ARMENUM.



THE DAINTY LITTLE GERANIUM SANGUINEUM LANCASTRIENSE.

THE BUSHY GROWTH OF THE RASPBERRY-PINK GERANIUM ENDRESSI.

As border subjects the taller species and their varieties, such as G. pratense, G. ibericum and G. armenum are singularly elegant in habit, they need no staking and their colours range from white to pale and deep blue, purple and crimson. Between these and dainty little G. sanguineum lancastriense we have a wide range of species in infinite gradations of stature, while their colours afford such diversities as the lovely, clear harebell-blue of G. grandiflorum, the blood-red of G. sanguineum and those of the allied G. nepalense and G. nodosum, the raspberry-pink of G. Endressi, the wild-rose tint of G. asphodelioides, the satiny-white of G. striatum, the gloomy plum-purple of G. phæum and the incomparable nemophila-blue of G. Wallichianum var. E. C. Buxton. All these, and there are many more, can be relied on to flower abundantly each recurring year and the blooming season extends without cessation from May to October. Some of the taller cranesbills bear double flowers which are by no means unbecoming and the family contains several hybrids of outstanding merit. One of the best of these is G. hybridum Russell Prichard, whose silvery foliage, inherited from G. Traversii, one of its parents, proves such a telling background for its vivid blood-crimson flowers. This is an amazingly prolific bloomer, usually being a mass of colour without a break from midsummer to late autumn. Another hybrid of which I am very fond, one that naturalises freely even in grass and flowers all the season, is a cross between G. striatum and G. Endressi, the blooms being large and a soft flesh-pink. G. striatum hybridises so willingly that I am hoping it will one day contract an alliance with the "Mourning Widow," G. phæum, and between them present me with a mulatto.

NOTES OF THE WEEK

THE GRACEFUL PHŒNICIAN VERBASCUM.

An Admirable Subject for Present Sowing.

IT is always a mystery why certain plants that are most accommodating and decorative should be neglected and never seem to enjoy anything approaching popular favour. Verbascum phœnicum is one of those plants, and yet there is no more hardy, useful and decorative subject. It is rarely seen in gardens, and few seem to appreciate its worth. If you throw a few seeds down upon any piece of waste soil and leave them to take care of themselves, you may confidently expect to find, next bedding-out season, a crop of well grown plants ready for bed or border, where they will give at least three months of continuous flowering. In fact, these verbascums grow like weeds, without having the slightest suspicion of a weedy nature.

I do not advocate such rough-and-ready treatment, however, rather should the seeds be sown in good soil, after the manner of wallflowers—say, across the kitchen garden—and thereafter given the usual treatment in the shape of transplanting and cultivating in order to obtain the largest possible plants.

The time to sow seeds depends upon the period of flowering desired. The plants are really perennial, but rarely give satisfaction after the first flowering season, and they should, therefore, be treated as biennials or annuals. If required to bloom early in the spring, the seeds should be sown in May and June; seeds sown during July and August may prove just as early flowering, but plants from these sowings usually flower during the summer.

Seeds sown at this time of the year will produce plants that commence blooming in May and well into June. They may be relied upon to take the place of spring bulbs, and with some of the more dainty flowers, like the forget-me-nots, pansies, etc., help to form an effective scheme of spring bedding. The seeds germinate quickly, and should be sown very thinly, for the tuft of leaves lies quite flat upon the ground and covers a fair area. The seedlings should be well thinned, but the plants may be transplanted with advantage, similar to the treatment accorded to other biennials.

When transferred to bed or border, either in autumn or spring, the plants begin to throw up a spike not unlike some species of veronica, which ultimately reaches a foot in height when the first flowers begin to open. These vary in size from that of a sixpence to a shilling, and are closely packed on the stem. The individual blossoms are saucer-shaped, and vary in colour from pure white, through the several shades of cream, flesh, pink, magenta, to a deep violet. As the first flowers die, after lasting two or three days, they are replaced by others higher up the stem, and this continues as the stem grows higher. Thus a very long flowering period is assured.

As pot plants, these verbascums are very accommodating and decorative. Seeds may be sown in small pots, and the plants shifted and grown on in the usual way. A fair-sized and somewhat deep pot should be selected for the final shift, because the large roots will require more than ordinary space for development.—H. A. DAY.

THE PHŒNICIAN VERBASCUM IS A USEFUL GARDEN PLANT.

THE FREE-FLOWERING SPIRÆA HENRYI.

SOME SHRUBBY SPIRÆAS.

AMONG shrubs which flower from midsummer onwards there are several spiræas of the highest merit. Notable among these are the members of the ash-leaved section. Here S. arborea, the Anak of the race, and differing but little from S. Lindleyana, is supreme in elegance as well as in stature. In rich, moist soil this superb species will make a vast bush 20ft. in height, every whiplike branch gracefully drooping with its large pinnate leaves and foamy panicles of white blossom. The latter, as well as the beautiful leaves, are often 18ins. long, and the flowering season extends from the end of June to mid-September. S. Lindleyana is hardly less imposing, and, perhaps, a more suitable species for many, on account of its somewhat smaller size; but in this case, as with most other spiræas, robust growth is largely a matter of feeding and moisture. S. Aitchisoni is another excellent ash-leaved species of still more moderate dimensions, bearing in August white flower panicles often as large as those of the foregoing. This is a much superior shrub to the allied S. sorbifolia which sometimes bears its label.

The well known S. japonica in its various forms, including the white (S. callosa alba) and var. Bumalda Anthony Waterer, whose crimson-carmine corymbs we do not, perhaps, appreciate at their full worth since too much familiarity is apt to breed contempt, are always reliable and showy little shrubs, giving masses of colour when most things are going off. No less can be said of the splendid S. Menziesii var. triumphans, which is, I think, the best of the willow-leaved section and an admirable waterside plant where there is ample space. S. discolor has, with me, had to give way to better kinds, its main drawback being the ephemeral nature of its flowers. Its place is now occupied by S. Veitchii, an excellent species of graceful habit bearing its ivory white flowers in corymbs nearly 3ins. across at midsummer. S. Henryi also stands out as a species of superlative merit. Like the last-mentioned, it grows about 8–9ft., the large but narrow leaves and purple-brown bark are distinct and handsome, making a fine setting for the conspicuous white flower clusters which crowd the wide-spread branches from mid-June onwards. Both S. Veitchii and S. Henryi, the former being a comparatively new introduction, should be much more frequently seen in our gardens, which latter are too often wanting in the more out-of-the-way subjects, especially among the later-flowering shrubs. Perhaps the suggestions here offered will help to encourage development in that direction. At any rate, I can promise anyone who has a fairly rich soil which does not get too dry the fullest satisfaction from the above-named spiræas.—A. T. J.

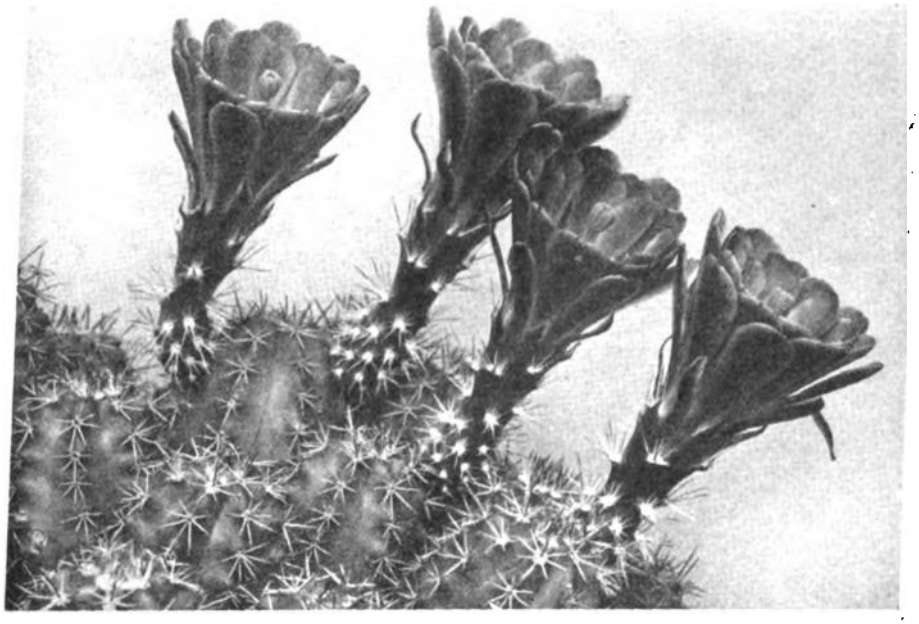
SOME INTERESTING CACTI.

AMONG the numerous plants of the New World the cacti probably form the most interesting group for the amateur. On the Continent they are at present most popular plants. In the hands of the skilful and patient amateur they grow more quickly than one generally is wont to believe. Many, if not all of them are of a peculiar beauty at all times of the year. The genus echinocereus contains some very handsome flowering species. Among them E. polyacanthus ranks very high, and is of the greatest ornamental value when covered with its large, almost blood-red flowers. It is often named Cereus polyacanthus. As a whole, the species of Echinocereus are not so easy to cultivate, as, for instance, Cereus flagelliformis, the well known rat-tail cactus, or most of the phyllocactus hybrids. What echinocereus need most is enough sun during the winter and a lot of fresh air at all times of the year. It is by no means easy for the amateur to establish these conditions. They want a rather heavy soil with a good deal of loam to which has been added a certain amount of leaf-mould, sharp sand and pounded brick or, better, pounded limestone. During summer they can be placed in a sheltered position outside, where they get the full sun and air but no draughts Two other fine species of echinocereus are E. Rœmeri with large almost scarlet flowers and E. enneacanthus with flowers of a straw yellow colour. Of E. polyacanthus there are several forms, differing from each other in the colour of the flowers and of the spines. These are sometimes whitish or reddish grey, sometimes reddish brown.—CAMILLO SCHNEIDER.



THE BLOOD-RED FLOWERS OF ECHINCCEREUS POLYACANTHUS.

YELLOW FOXGLOVES.

IN course of time, in all probability, we shall have yellow foxgloves equal in stature and grandeur of flower to the magnificent varieties of the common one, D. purpurea, but it must be confessed that, interesting as they are, the yellow foxgloves we now have are far short of their popular sister flowers. Yet, apart from their distinctness, most of them present some points which commend them to many folks. This is evident from the fact that they are offered in catalogues.

Were there not a demand for these flowers the nurserymen would cease to grow them for sale. In all probability the improvement in these yellow foxgloves will come from hybridising them with D. purpurea, although it is quite likely that the continual raising of seedlings, the selection of the best, and sowing seeds from these again, will lead to the production of finer flowers of more commanding habit of growth. Some of them are under the disability of being biennials, like D. purpurea, but there are two or three which are true perennials. Beginning with the biennials, we have D. ferruginea, rather dull-looking, it is true, but pretty in its quiet way. It has light yellow flowers which are veined with purple. This can be raised from seeds and grown in ordinary garden loam, where it will attain the height of 3½ft. or 4ft. A pretty new hybrid of the above has been raised and is offered in seeds under the name of D. Isabellina. It is about 3ft. high and has yellow flowers, which, however, are of rather a dull hue. D. lutea is one of the best of these yellow biennials. It is about three feet high, and has brighter blooms than the above. Several good perennials are also offered and seeds of D. ambigua and D. ochroleuca may sometimes be had. D. ambigua, although somewhat dull in its yellow colouring, is interesting and quietly pretty when examined. It is about 3ft. high. D. lævigata, which grows to about 3ft. has distinct flowers of bronzy yellow, brightened by a white lip. D. Lutz hybrid is reputed to have flowers of a pleasing salmony tint, but I have not seen this flower. D. ochroleuca, which is sometimes grown under the name of D. grandiflora, about 3ft. high, is of a pale yellow, and, when compared with D. purpurea, the alternative name of grandiflora is distinctly misleading. It may be added that, occasionally, pretty self-hybridised plants with yellowish flowers have appeared in gardens.—S. ARNOTT.

RUBUS AUSTRALIS.

ALTHOUGH on the whole this plant must be considered tender in many parts of Great Britain, it is, nevertheless, an interesting subject, and one that always attracts the attention of visitors, while, moreover, it is quite distinct from the various rubi seen in this country. At Castleford, Chepstow, where the photograph was taken, it is grown in an exposed position on the side of the rock garden, where it has long since outgrown its station, and being a unique plant it has been allowed to develop in its own sweet way. It has been described as a lofty climber, and had it been planted at the base of an old tree or other support, it would undoubtedly have attained a height of 20ft. or more. The leaves are small and very few in number, and usually reduced to prickly midribs. The slender stems are armed with small hooked prickles, and the small, fragrant flowers are yellowish or whitish in colour. R. australis is a native of New Zealand, and is known as the lawyer vine. This winter we experienced 18° to 20° of frost on three or four occasions, but the plant came through safely, as the photograph, which was taken in February, clearly shows. In the winter of 1916 and 1917, when I was enjoying the brilliant sunshine of the East, the plants suffered badly from frosts.—T. W. BRISCOE.

A LARGE PLANT OF THE CURIOUS RUBUS AUSTRALIS.

THE VALUE OF FOLIAGE—III

GREY foliage: just what this *should* cover is hard to say. Grey, as applied to plants, is such an elastic term, so I feel I shall still be within my province by describing plants of silvery, glaucous, blue (as applied to conifers) and, in fact, some whose foliage is white or silvery only on the under side.

The uses of lavender are far too well known to need any recommendation, but I must just mention them. The conifers offer such a wide assortment with the so-called blue foliage, many of which, planted in suitable positions, make specimens such as no other race of plants can do. A good abies for such work is A. concolor, a good and robust tree and described as "blue," an improvement on this form is A. concolor violacea, which is more glaucous blue. Picea supplies some good colour in P. pungens Kosteriana and P. Moerheimi. Which is the finest of the two I must leave those who see them to decide for themselves, as each claims equal merit. It is certain that for colour they cannot be beaten. Two hemlock firs I must mention are Tsuga Pattoniana glauca and T. Douglasii glauca elegans; both are exceedingly beautiful and most graceful trees, and in spring, when the sunlight strikes them, they are charming. Another tree which glows with silver-grey under such conditions is Cedrus atlantica glauca.

The cypress, or cupressus, supplies some exceptionally good forms, one of the finest being C. lusitanica glauca pendula. This I consider the most graceful and best coloured tree for an isolated specimen, the young pendulous shoots, being quite silvery, give it an appearance few trees can equal. Moreover, it is a quick grower and good doer. C. cashmeriana is, indeed, beautiful and of splendid colour, but, unfortunately, it will not grow everywhere. It does not like wind or too much moisture during the winter months; where elevated positions in sheltered spots can be found, it is worth trying. To those who cannot grow cashmeriana, I would recommend C. Fletcherii. This is of a beautiful colour, makes a handsome tree and is not nearly such a slow grower as we have been led to believe, my experience being that, when established, it will grow a foot in each year. It is quite hardy and does well on chalk. Another and taller grower, described as blue or glaucous blue, is C. Triomphe de Boskoop. As this variety remains well furnished quite to the ground, it makes an excellent hedge, but care must be taken not to overcrowd the plants; they must be planted at the very least 4ft. apart. For early effect it therefore becomes necessary to plant trees of 3ft. to 4ft. in height. The juniper gives us a particularly good thing in J. pachyphlacea and its variety conspicua, but I am sorry to say it is not particularly hardy. It objects to cutting winds, but where it can be grown it makes a splendid bit of colour.

Of other silvery-leaved shrubs and trees there are many which prove quite hardy under good conditions, but not otherwise. Teucrium fruticans, a beautiful white-stemmed plant with foliage, that is green above, and white beneath, in dry winter quarters or on exposed hillsides is quite hardy; winter wet at its root is fatal. Perowskia atriplicifolia is another silvery-stemmed and foliaged plant; this also likes a well drained soil, but is quite hardy. It should be cut down to ground level each year in early April. When covered with its long spikes of lavender flowers in August it is indeed beautiful. The senecios are good evergreen plants bearing grey or green foliage. S. Greyii is quite the whitest of all, but they are fortunate who can obtain the true plant, as in ninety-nine cases out of a hundred S. laxifolius does duty for S. Greyii. Many gardeners and some nurserymen declare that the two names belong to the same plant, *i.e.*, S. laxifolius; but I can assure my readers that those who have actually seen S. Greyii do not say so. It is a plant to covet; but, after all, S. laxifolius is a really good plant, with greyish green foliage, and in summer it gives us sheets of golden, daisy-like flowers. It likes dry winter conditions, but plenty of moisture in summer. S. compacta and S. Monroi are two rather smaller-growing varieties, both with very pretty undulated and dentated foliage, compacta silvery beneath, Monroi decidedly buff colour, both showing their under colouring round the edges of their foliage, thereby giving it a most pleasing effect. S. elæagnifolius is a fast-growing tree and will stand the roughest gales around the coasts; it is very ornamental as a specimen, especially where planted on high ground, so that when breezes blow it shows the very

THE DISTINCT GREY FOLIAGE OF SENECIO LAXIFOLIUS.

THE SILVERY FOLIAGED ARTEMISIAS ARE EXCELLENT FOR THE ALPINE GARDEN.

Digitized by Google

white under sides of its beautiful foliage, which above is brightest green. It also makes excellent hedges or windbreaks. S. elæagnifolius is better known under the name of Olearia Traversii. A large-growing tree suitable for park or woodland, with large silvery leaves some inches in length, is Sorbus majesticus, single plants of this growing in woods or shrubbery catch the eye, even at long distances. Another beautiful tree which makes a fine weeping standard is Pyrus salicifolia pendula, which, as its name implies, carries willow-like foliage of a beautiful shade of silvery grey. The Himalayan whitebeam, Pyrus Vestita, is one of the very finest silver-leaved trees in existence and will do well on practically any soil, including chalky or very limy soils. Some of the buddleias are extra good as regards their wonderful grey foliage. The best, taking into account its beautiful flowers, is B. Colvillei. Better foliage, but poorer flowers, is found on B. Forrestii and B. Farreri. A buddleia bearing both white flowers and foliage is B. Fallowiana. Another which makes a great show is B. nivea. The young stems and leaves, which are very large, are quite white. Berberis dictophylla is a glaucous stemmed and foliaged variety. A good grower, reaching 4ft., it is deciduous. Some good silver-foliaged plants are found among the artemisias, atriplex, rubus (thibetica), yuccas, olearias, cotoneasters, elæagnus, hippopbæa, etc.

As a last item, even if we grow it indoors, I must mention Leucodendron argenteum, the silver-leaf tree of Table Mountain. There are still very many other grey-foliaged plants, but those enumerated will, I think, be sufficient to show that, if one wished, it would be possible to create a glorious garden of such subjects. I can imagine such a garden of shrubs, with here and there spikes of tall delphiniums towering above the dwarf plants of Senecio laxifolia. JOHN HILL.

THE SPINEY ELM, A NEW INTRODUCTION

BY E. H. WILSON.
Arnold Arboretum.

THE SPINEY ELM IN ITS NATIVE HOME.

THE ALMOST BLACK AND DEEPLY FISSURED BARK.

A COMPARATIVELY new tree introduction is the spiney elm (Hemiptelea Davidii), a native of Korea, southern Manchuria and north-eastern China south to the Chekiang province and west to the neighbourhood of Nanking. It is very often met with in hedgerows and waste places as a dense bush or low tree and, indeed, of itself often makes a formidable hedge. Under proper conditions it is a tree of fair size, often 50ft. tall with a trunk 6ft. or more in girth, and a crown of irregular shape composed of thick branches and many thin branchlets all more or less armed with stout spiney secondary branchlets. Its most striking feature, however, is the almost black and deeply fissured bark. For this ornamental character alone it is worth a place in park and garden. In central and southern Korea in particular this tree is common and often forms small groves such as the illustration depicts.

The tree has been given three generic names and for some unknown reason the botanists in Great Britain seem unwilling to admit its distinctive merits. The latest Kew Hand-list of Trees and Shrubs refers it to Zelkova, but it is readily distinguished from all members of that genus by the character of its bark, by its spinescent branchlets and by its fruit, which is a stalked, winged, ovate, samaroid-nutlet. The fruit is really intermediate between that of Zelkova and that of the elm. The bark is more akin to that of certain elms, but these trees never have spiney branchlets, and their fruit is a thin, flattened samara. That the spiney elm represents a genus distinct from others of its family no one who has knowledge of the adult tree or has seen it growing wild can for one moment question.

This tree has been growing in the Arnold Arboretum since 1904 and has never suffered winter injury. It should be at home in the coldest parts of the British Isles. Under the name of Zelkova Davidiana, Bean, in his book, says that it is a "promising tree and grows freely," and Mr. Gibbs in his article speaks highly of it from its behaviour at Aldenham House.

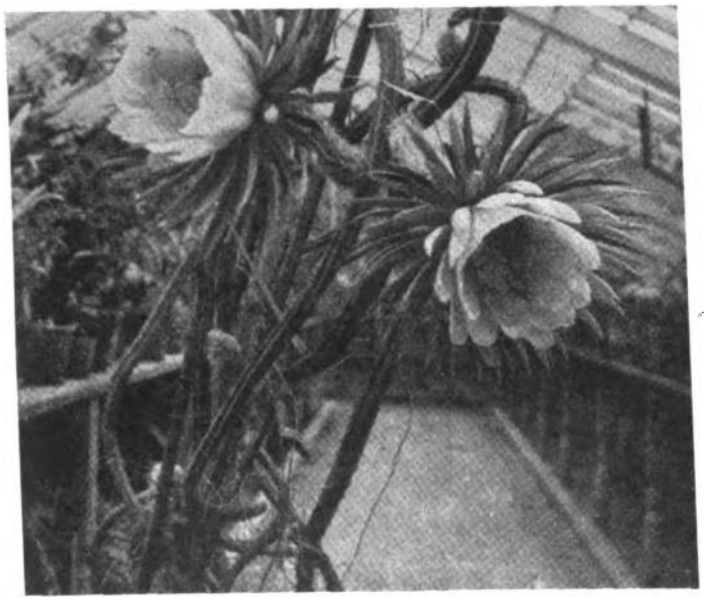
CORRESPONDENCE

AN INTERESTING CACTUS.

SIR,—Cereus grandiflorus, or "the night-flowering cactus," is a member of that extensive family the cactaceæ and a native of the West Indies.

The flowers continue for about six hours in full bloom. They begin to open between seven and eight o'clock in the evening and are at the height of their beauty by midnight. Towards morning, between three and four o'clock, they fade, although if the morning be dull, they will remain open until about six o'clock. There is hardly any flower of greater beauty with so short an existence.

The calyx of the flower when open is nearly 1ft. in diameter, the inside being of a yellow colour, somewhat resembling the rays of a bright star; the outside is of a dark brown colour. Having pure white petals the flower is most attractive in appearance; the vast number of recurved stamens in the centre of the flower add to its beauty. Still further to enhance its charm the flower possesses a strong sweet fragrance, which fills the house wherein the plant grows and even the adjoining houses, too.



THE NIGHT-FLOWERING CACTUS.

Plants grown in 10in. pots with the stems trained on stakes, make unique specimens for house decoration in the evening, especially when placed against a dark background, which greatly assists the flower or flowers to be seen to the fullest advantage by guests after dinner. —H. BRUINS-JICH.

A TREE FAILURE.

SIR,—Your Editorial in THE GARDEN of June 12th under the above heading prompts me to write a few words respecting the famous avenue of these trees at Bicton, East Devon, now owned by Lord Clinton. There are twenty-five on either side of the carriage drive before entering the deer park leading to the mansion. This avenue is 500yds. in length, the individual trees growing opposite each other, 63ft. apart and 54ft. apart in the rows, comprising many noble specimens bordering on 60ft. in height, the best being well feathered to the ground, or they were in 1913. Several of these trees in 1906 at 4ft. from the ground measured 7ft. 6ins. up to 9ft. in circumference. Practically each year towards autumn quantities of good seed fall to the ground, and there is, or was, one tree that bore male and female cones which proved a novelty to tree lovers. Veitch's "Manual of Coniferæ," published in 1900, illustrates this avenue from the eastern lodge, which could not fail to interest you, Mr. Editor, as it is certainly the finest collection of these interesting trees in this country. There is a short avenue at Poltimore Park, near Exeter, with very healthy trees. These are more sheltered than the Bicton ones, but I doubt if that has much to do with the growth of the tree or maintenance of the lower branches. The subsoil is more likely to cause these to turn brown and die off. It may be added that seeds germinate freely if sown in very sandy soil as soon as ripe.—J. MAYNE.

SWEET PEA "BLINDNESS."

SIR,—Can some reader, or readers of THE GARDEN, tell us through the medium of the Correspondence columns, what is the cause of "blindness" in sweet peas? Although several theories have been advanced, the one generally accepted is that a very small insect (one has not heard it actually named), destroys the tiny growing point of the plant at a fairly early stage of the latter's development. I can well imagine some readers thinking, "What is blindness?" Every exhibitor knows—many perhaps wish they did not. What happens is this: the growing tip or point ceases to make further progress, usually when the plants are between 2½ft. and 3½ft. high. Of course, this is of very little consequence to all who do not practise the "cordon" or "single-stem" system of culture, for the lateral growths "carry on" in an unpruned plant, and unless the grower is very observant, blindness may never be noticed. In the case of the exhibitor, it is much more serious. He has restricted his plants each to one or two cordons or main growths only, pinching out every lateral as it appeared at the leaf axils. If he does not notice the blindness in time to leave a lateral, it will be a case of no more flowers as far as that particular plant is concerned. Even if a lateral is left to take the place of the leader, it will not bear good quality flowers for at least three weeks, and may possibly object to taking its leader's place and wilt, after growing for a little while. It will be readily seen that, to the exhibitor growing a limited number of plants, the loss of bloom occasioned by even 10 per cent. of them going blind might well frustrate his plans. Apart from this, it is exceedingly disappointing after the care, labour and expense involved in producing flowers which would be considered first class by modern standards.

The observations I have made and verified in connection with "blindness" during the past few years are not conclusive by any means, but may throw some light on the problem. If we could only determine the cause, there would be a fair chance of finding a remedy. In the first place, a few varieties (all of them vigorous growers), seem particularly susceptible to blindness, although it will occur in greater or less degree in almost any variety. This seems to me to dispose of the insect theory, for why should an insect single out particular varieties for its unwelcome attentions year after year? Then, again, in some seasons the trouble is very much more pronounced than in others, and although I have not definitely proved any connection between its appearance and the prevailing weather conditions, a wet and cold early summer seems to herald an unusual prevalence. Plants which have never been "pinched" when young to encourage basal side growths and in which the original seed growth has been taken up the canes, are more prone to blindness than "pinched" plants of the same variety, although one cannot assert that "pinched" plants are entirely immune. As far as I am aware, soil conditions have no effect either way, nor have cultural methods other than "pinching," for only a few days ago I noticed several cordon grown plants of a variety going blind, and on inspecting plants of the same variety in another part, grown naturally without restriction, saw that they also showed about the same percentage.

In summing up, one may add that the only precautions an exhibitor may take is to "pinch" his plants when in their seed boxes or pots and so make quite certain that no seed growth is trained up, and later, to watch his plants carefully when removing laterals so that a lateral may be left to take the leader's place if it should go blind.

Is blindness a perfectly natural condition which we must accept as hereditary and therefore inevitable in some varieties, or is there some outside cause which may be controlled? As I have already remarked, it need not worry the ordinary grower, but there are many exhibitors who would like to know how to minimise it in some other way than by ceasing to grow the particular varieties which experience teaches them are the most susceptible.—C. H. A. S.

FEIJOA SELLOWIANA.

SIR,—In reply to the enquiry from O. T. Bryant *re* Feijoa Sellowiana, there is a plant here growing against a wall, planted in 1911, now 7ft. 6ins. high, 13ft. across, which flowers very freely every year and a few years ago had nearly 100 fruits, which attained the size of a small pear and remained till November frost destroyed them. Last year we had two small fruits on it.

We have also a small specimen growing in the open, which also flowers very freely during July. I consider the Feijoa is one of the choicest flowering shrubs for July, either grown against a wall or as a specimen in the open.—W. F. HAMILTON, *Lymington Hants.*

SIR,—Referring to the letter in THE GARDEN of June 12th *re* Feijoa Sellowiana, I think it worth mentioning that this shrub fruited with me a few years ago and I actually ate one of the fruits. It had a pleasant flavour, but was not properly ripe.—H. G. HAWKER, *South Devon.*

HARDY TAMARISKS.

SIR,—I recognise the illustration on page 350 of the issue for June 19 as representing the old tamarisk growing at the top of my rock garden, and think I ought to point it is not, as stated, Tamarix gallica, but T. tetrandra. Also, that the photograph was taken in the end of May, when the tree was in full bloom and before it had developed its "sweeping feathery foliage."

As Mr. Bean points out in his invaluable book: "Among cultivated tamarisks it is

Digitized by Google

distinct in flowering early from the old wood. . . . A shrub of great beauty and grace."

To my mind it is the best, as it is also the hardiest of the genus. Its bright pink flowers, produced in May and early June, before the green leaves are sufficiently developed to compete with them, provide one of the most beautiful pictures of the year. Anyone who planted T. gallica expecting to get the effect shown in the illustration would be sadly disappointed.—E. A. BOWLES.

[We regret this error. Unfortunately, we took this T. tetrandra as being that of Bunge, which is given as a synonym of T. gallica. —ED.]

THE AMATEUR SHOW

THERE were many groups of cut flowers staged, and in several of the classes competition was exceptionally keen. There was nothing particularly outstanding among the hardy flowers except one or two of the seedling delphiniums, but sweet peas and carnations we thought were above the average.

The sweet peas certainly formed the most attractive feature in the Show, with their prominent position and their kaleidoscopic colourings, and the high standard reached by the majority of the competitors augurs well for the National Sweet Pea Society's Show at Cheltenham this week. There seems little doubt that the sweet pea is the amateur's flower, if one judges from the numbers shown. All the leading varieties were on view, including many recent novelties, and the rich colouring and fragrance obtained indicate that the amateur has become almost as proficient as the professional in their culture. The method of staging and the general arrangement were well carried out in every case; and the high quality deserved every praise.

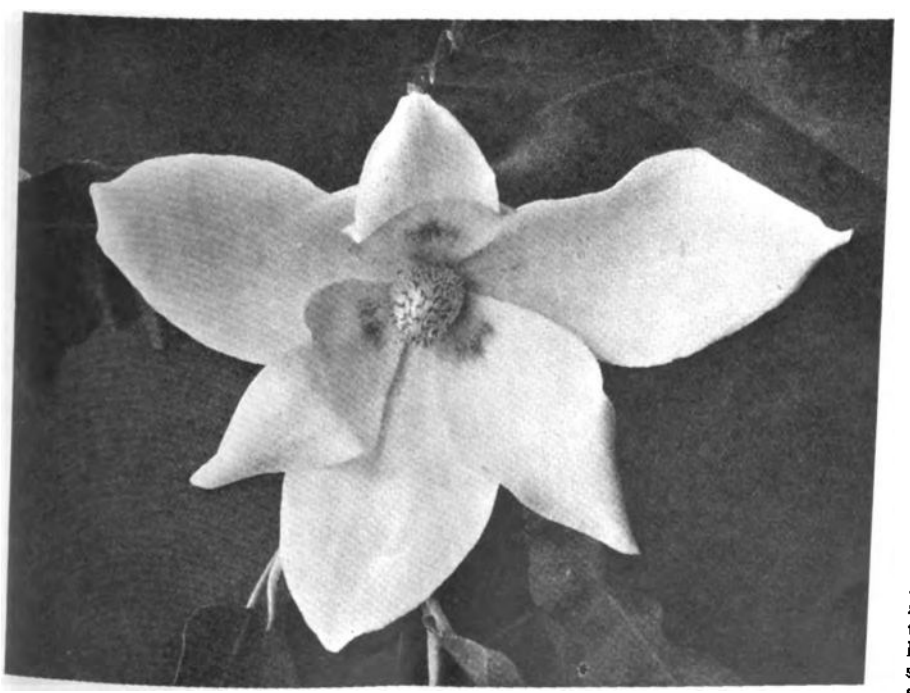
Among the delphiniums, competition was also keen, and the first prize went to Mr. Watkins Samuel of Wrexham fame for his excellent collection. The flowers of Jenny Jones which he staged were fully 2½–3ins. across and of blue overlaid violet tone, which is exceedingly attractive. It is an elegant variety and should prove effective in the garden borders. Another fine group was arranged by Mr. E. H. Blakesley, Redhill Common. It was, perhaps, a little unfortunate that the spikes of the delphiniums were placed so close together, as there was little chance of picking out the striking characteristics of the many attractive seedlings.

The herbaceous flowers, on the whole, were below the standard which could be justly expected at this time of the year. There was a distinct lack of taste shown in the arrangement of the groups, and a greater variety of subjects might have been included in the individual groups. Reference has already been made to the exhibits of peonies by American amateurs, on another page, and to the fact that they were disappointing. The classes for violas and pansies were well represented and many fine blooms were to be seen, the majority being well displayed.

Although not present in large quantities, the carnations were particularly good for this time of year, and the first prize exhibit of Sir Randolph Baker for six vases of border carnations reached a high standard of excellence. The varieties which were shown were all good sorts and included Laddie, of good size and colouring; Tarzan, Saffron, Maine Yellow, White Pearl and Topsy. The flowers were of good shape and well carried, and their size was remarkable for the lateness of the season. The other exhibits in the carnation classes were all good, and the exhibitors deserve credit for the general all-round level of excellence and the tasteful way the varieties were staged.

The roses, although given a prominent place in the schedule, were not a prominent feature. One or two good exhibits, notably Mr. Herbert Wettern's of Oxted, who gained two first prizes, were to be seen; but the others contained blooms which obviously had suffered severely from the inclemencies of the present season. Probably the reason for the lack of exhibits in the rose classes is the fact of the forthcoming show of the National Rose Society at Regent's Park on July 2nd and 3rd.

MR. CORY'S INTERESTING EXHIBIT OF SUCCULENTS.



THE BLOOM OF MAGNOLIA MACROPHYLLA, PROBABLY THE MOST STRIKING FLOWER IN THE SHOW.

The groups of twelve flowering shrubs prove what can be done in the way of flower during June. Colonel Stephenson Clark won the first prize in this group. The colour scheme was excellent, with the flame-coloured Rhododendron Griersonianum, the pale lilac form of Abutilon vitifolium, the dull crimson of Leptospermum Nicholsi, the snow white of Styrax Hemsleyanum and the greenish white of Chionanthus virginica. These are all magnificent shrubs worthy of being grown in any garden. On Mr. Rothschild's exhibit, that won second prize, the most noticeable plant was Cornus Kousa. The third prize was given to Sir William Lawrence, whose finest plant was undoubtedly a splendid bloom of the American Magnolia macrophylla, yellowish white faintly painted with purple at the base. The flower is about 10ins. in diameter, while the leaves are 14ins. in length. Mr. Cory staged a large exhibit of flowering shrubs, not for competition, including the very rare Fuchsia corymbiflora alba, the cream Syringa japonica, Pterostyrax hispida; Mr. Cory also showed a magnificent collection of cacti and cotyledons. The size and health of the plants were extraordinary. The hedgehog cactus, Echinocactus Grusoni, formed a spiny barrel almost a foot high; while the Old Man cactus, Cereus senilis, must have topped 2ft. Mr. H. G. Harrison also staged a good exhibit of cactaceæ including an interesting pan of seedling cacti.

One of the finest exhibits in the Show was that of Colonel Messel, who deserves every credit, together with his gardener,

Digitized by Google

Mr. Comber. A fine collection of candelabra and sikkimensis primulas was shown, including many of those of Mr. Kingdon Ward; while among the shrubs Magnolia Watsoni, Leptospermums Chapmanni and Nicholsi and Pterostyrax corymbosum.

A particularly showy group was the extensive assemblage of orchids and ornamental plants shown by Sir Jeremiah Colman, Bt., Gatton Park, Surrey. Along the back were well flowered examples of Sobralia hybrids, Epidendrum gattonense and the elegant Dendrobium Gatton Sunray. Lower down were fine plants of Cypripedium Maudiæ, distinct varieties of Cattleya Mendelii, and several blotched forms of Miltonia vexillaria. Along the front were arranged Cirrhopetalum picturatum, with an umbel of flowers, the curious Masdevallia velifera, and the charming Sarcochilus Cecilia.

Mr. H. T. Pitt, Rosslyn, Stamford Hill, staged a very fine group of orchids, in which Miltonia hybrids stood out prominently. Maxillaria tenuifolia and Odontonia Magali Sander were both very well grown, as also was Cattleya Mossiæ Reineckiana. Cypripedium glaucophyllum and C. Curtisii Sanderæ came in for appreciation, and among the odontoglossums the best were cordatum and the excellent var. Prince of Orange.

In the class for a dozen orchids, Mr. J. J. Bolton, Claygate, Surrey, was placed first with plants of high standard and all in fine condition. They included two unusually fine varieties of Odontoglossum crispum, O. Purple Crown, O. Doreen var. D. A. Cowan, with a spike of eight roundly formed flowers having rose-purple spotting.

Mr. H. T. Pitt, Stamford Hill, came second with a more varied selection, including Cœlogyne Burfordensis, with a spike of thirteen yellowish green flowers, Miltonia phalænopsis, with thirty flowers, Odontioda Brewii, with a couple of spikes, and Miltonia Wm. Pitt var. Kings Crown, with flowers of a pleasing rose-purple colour. In the centre was a dark variety of Epidendrum prismato-carpum.

Sir Jeremiah Colman, Bt., had several showy plants in his exhibit of a dozen orchids and although given third place, this group was, in many ways, equal to others in the class. Dendrobium Gatton Sunray and a well flowered Thunia gattonensis, were very attractive, and so was Cypripedium Lawrenceanum Hyeanum, with five large flowers.

For six orchids, Mr. E. R. Ashton, Camden Park, Tunbridge Wells, was placed first, this amateur showing Dendrobium atroviolaceum, Miltonia Lyoth, with pleasing flowers of rose colour, Lælio-Cattleya Princeps, of rich purple in the lip and flushed with similar colour on the petals, and a very fine example of Promenæa citrina.

Mr. A. M. Gentle, St. Albans, came second with Odontioda Bradshawiæ, a well flowered plant of Maxillaria tenuifolia, Cypripedium beilatulum and Lycaste aromatica, the latter with eight flowers.

The only exhibitor in the class for a single orchid was Mr. F. M. Vokes, Sholing, Southampton, who staged a pretty Lælio-Cattleya, doubtless a hybrid of L. purpurata.

THE FLOWER GARDEN

IXIAS.

A Bulb that Should be More Often Seen.

AMONG the many graceful bulbous plants which have come to us from South Africa there are few more attractive than the ixias. All the species make admirable subjects for the greenhouse, but they will be found to succeed equally well on a warm border almost anywhere in the south of England. In all cases it is essential that the soil should be light in character, and out of doors the bulbs should be planted rather deeply (5ins. or 6ins. below the surface), and may well be protected during the winter from heavy rains by dead fern or similar material. When planting ixia bulbs it is most important that these should be set very firmly, as they have a tendency to start upwards as soon as rooting begins. In a greenhouse ixias will flower in the early part of the summer; out in the open border they will naturally be somewhat later. Until the flower-spikes actually appear it is much better that ixias should be kept on the dry side, and many cases of partial failure are due to the fact that the bulbs are continually in over-damp soil.

It is most interesting to raise ixias from seed. These are best sown in pans of sandy soil, and almost any time between the spring and fall is suitable. Keep the pans in a cool frame and allow the little plants to remain as they are for a year. Then pot up the small bulbs or plant them out. Ixias from seed usually flower about the third year from sowing, and many surprisingly beautiful varieties will appear. A much quicker method is increase by means of offsets, of which considerable numbers are usually produced. These may be secured after the parent bulbs have ripened off and they flower well in the following year. Whether ixias are grown in pots or in the open, it is needful to see that the foliage ripens off naturally so that the bulbs may receive their proper store of nutriment. If, for any reason, the bulbs have to be lifted while the leaves are still green, put them in some place where the foliage will die slowly and not wither up in a few hours. When the leaves have gone the bulbs may

IXIAS FOR A SUNNY BORDER.

be stored in a dry place until the autumn. Quite good results are secured by letting the ixia bulbs stay in the soil, providing they are kept dry during their resting period.—S. LEONARD BASTIN.

SOW CYCLAMEN SEEDS NOW.

OPINION varies considerably regarding the correct or rather the best time of year to sow seeds of greenhouse cyclamens, and probably there is no better way of coming to a decision than that of judging by results. In our own case we prefer the end of June or early in July; by sowing at that time the seedlings can be had of fair size before the winter comes, and they seem to us to pass the winter better under these conditions. Having done so, they are then able to grow into strong and robust plants which flower profusely. Cyclamens are always slow to grow when they are in the seedling stage, but they can be encouraged by loosening the surface of the soil slightly with a label, this aerating and freshening up the compost. Sow very thinly to obviate too early a necessity for transplanting and place in pots or in another pan when they throw up their second leaf. Sown just now they come into flower the second winter, *i.e.*, eighteen months after. Only seed of best quality is worth sowing.—LANARKSHIRE.

MOSS ROSES.

I WONDER why these are not more generally grown in our gardens, for they are among the most fragrant of the summer roses, and groups of them growing near some of the main paths of the garden would be very charming. They are not difficult to grow where the soil is deeply dug and made fairly rich with well rotted manure. The plants are easily increased by layering, but plants, once established, will live and flourish for many years. The Old Moss, delicate rose and very fragrant; and Blanch Moreau, white and very free, are two sorts that should be grown, the plants being grouped in distinct colours.—GEORGE GARNER.

BROMPTON STOCKS.

How to Raise Young Plants.

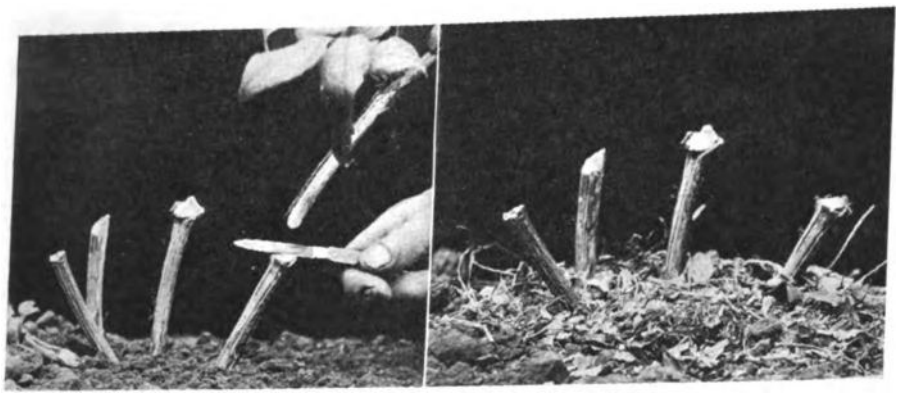
THESE stocks are extremely valuable for furnishing the greenhouse or conservatory in late winter and the spring months, and also the flower borders in spring before the ten-week stocks bloom outside. The seeds should be sown very thinly early in August, or in the northern counties about the middle of July. Sift the soil through a half-inch mesh sieve; this will form the bulk. Then sift some through a 1in. mesh sieve and add one peck of the latter to two pecks of the former. Well mix the more lumpy with the finer portion and add a 6in. potful of old lime rubble to every peck of the combined parts. Place some rotted leaves or manure in the bottom of a 6in. deep box, then fill up with the compost; level it, make moderately firm, then water. Sow the seeds thinly, cover lightly with fine soil, but do not water. Place the box in a light position, but shaded from the sun. Transplant the resultant seedlings while they are very small, taking care of the round seed-leaved ones—as these generally bear double flowers—and pot separately at the next shift. Those intended for the open borders may be transplanted there in October. For the final potting of those that are to be flowered under glass turfy loam should form the bulk of the compost. Place one plant in a 6in. pot, two in 8in. and so on.—G.

PRUNING CLEMATISES.

A Useful Warning.

THERE is apt to be a good deal of misconception as to the treatment of clematises after they have done flowering each season, especially among those who are growing the clematis for the first time upon a new house or in a newly acquired garden; and the time for action is not now far away in the case of certain species. There are many sections into which

Digitized by Google



C. JACKMANNI MAY BE CUT DOWN EACH SPRING TO WITHIN 12IN. OF THE GROUND.

A MULCH OF LEAVES IS MOST BENEFICIAL AFTER PRUNING.

clematises may be grouped, but they may be placed into two categories for practical purposes—the early-flowering, those that bloom from May onwards, and the late-flowering, giving flowers in late summer and autumn.

Early-flowering clematises include the patens and Florida groups, the former blooming in early spring and being much used for greenhouse work in pots, and the latter during the summer months. Everyone knows the decorative Clematis montana, which is capable of thickly covering almost any site with a mass of starry white blossoms in May. This plant, for example, should be pruned just after it has completely gone out of flower—July may be cited as a suitable time; but it is a question to be answered by the owner of the plant as to whether it shall receive pruning or not in the generally accepted meaning. If a covering mass is wanted, there is no necessity to touch the tree; but in all cases it pays to remove all shoots and weak or straggling growths that serve no useful purpose, exhausted wood, dead twiggy growth, etc.

Useful specimens of Clematis montana may be obtained by allowing the main stems to find their way over the whole surface of the object to be covered, and then having the shoots that have borne flowers removed each year to allow room for the new shoots that come in abundance all over the main stem. This may also be said of most of the spring-blooming clematises, those of less vigorous growth being treated chiefly to prevent overcrowding and decay. Pruning may be left to early spring, but the same year offers better advantages.

The summer-flowering clematises—especially those that produce double blossoms—require a very small amount of pruning, chiefly in the way of removing weak growths in the autumn and the shortening of the main shoots in the early spring.

There is exactly the opposite in the case of the late summer and autumn flowering clematises. These belong mostly to the Lanuginosæ and Jackmanni types; the latter being the most popular and in evidence in the majority of gardens.

The Lanuginosæ require the old wood and all weak growths to be entirely removed, and the new shoots tied into place. This should be done in February. These clematises must not be pruned before early spring.

The same may apply to the Jackmanni clematises, with a recommendation to give a severe pruning, cutting the stems down each year to within a foot of the ground. Here again, however, this procedure depends upon the area to be covered. It will be found that severe pruning will induce most vigorous growth and prolific flowering; therefore, as the bare stems are no particular ornament during the season they are out of flower, it is just as well to prune hard and secure vigorous growth, which will probably cover the desired amount of space.

While the manner and extent of pruning may well be left to the tastes and desires of the grower, in order to suit his circumstances, these notes will be of use to afford warning not to attempt to prune until the correct season. It is a very easy matter to prune clematises in the autumn, when a desire may be felt to make all tidy for the winter, especially where the house frontage is concerned. Except in the case of the early-flowering clematises—which, after all, may not require attention to any great extent—the rigid rule should be: leave the plants alone until springtime, when pruning and trimming may advantageously be performed up to the end of March.—H. D.

THE LAWN.

Preparing Ground for Grass Seeds.

THERE are two months in the year in which grass seeds are sown mostly — in April and August respectively. More are sown in the former than in the latter month, but there are, frequently, good reasons for not sowing in the spring, and equally good ones for sowing in the early part of autumn. It is better to sow in well prepared ground in August than in uncleaned soil in the spring. There should not be much difficulty experienced in getting the soil clean and in first-class condition just before the month of August.

If the soil is fairly clean—that is, free from the long roots of coarse weeds, it is not any advantage to dig up the ground deeply. Surface preparation only is needed, provided the surface is level; it may be undulating, but it must not be irregular on the surface. Tennis and similar grounds must, of course, be level.

Soil containing the roots of coarse weeds must be deeply dug, the roots of the latter extracted whole, as far as possible, and big stones and all foreign matter, too. It does not matter much if the soil is rather wet while this work is being done; but while the final levelling is being carried out the soil should be dry. Treading firms it better than rolling. Having raked the soil, mark out the surface in square yards to facilitate even distribution of seeds. Rake the soil evenly first. When ordering the seeds, always tell the seedsman what the character of the soil is.—HANTS.

GREEN HERBAGE.

Various Plants for Lawns and Slopes.

THE success of a lawn depends to some extent upon the character of the soil, as well as that of the herbage or turf. Grassy slopes are sometimes more difficult to keep in good condition during a dry season, especially if the soil is light and sandy and the slope or embankment faces the midday sun. Often we see the herbage by mid-July or August turn quite brown and unsightly. Watering is of little use, if the soil is of a character incapable of retaining moisture. We have seen wild white clover sometimes succeed in clothing the surface with green, when lawn grass has failed. But camomile and common yarrow are even better adapted to facing a slope with a carpet of green. These plants can be mown like grass. They spring from the root when cut, and send up a close mat of fresh shoots. Care must, however, be taken not to mow too closely. This circumstance also applies to dry lawns as well as to dry slopes, or sunny banks, for if the herbage is cut too close to the root, it will fail to collect its full quota of dew. In summer such herbage lives mostly on dew. The common yarrow (Achillea millefolium) and camomile (Anthemis nobilis) will thrive on soils where other herbage fails; but there is another plant that might be used to improve lawns—not, however, on dry soils, but rather on those that are damp and sour. I refer to the weed sometimes known as "spergula." Its botanical name is Sagina procumbens. The true spergula is hardly so well adapted to the purpose of improving a patchy lawn, though it is, indeed, a more elegant plant. It does not produce such a close sole of herbage as the plant indicated, which may be found in flower-pots, in little tufts, and in many waste places. In a heap of old potting soil it is often to be found. If it is required in quantity, it can be grown in a bed, well dressed with soil thrown out from flower-pots. To improve the lawn it may be dibbled into the ground during showery weather, after mowing. It does best when planted in April. Roll the turf immediately afterwards. Should drought set in, the lawn may be watered. That will help the sagina to take root and spread.—J. W.

TWO GARDEN PESTS.

Wireworms and Leather Jackets.

WIREWORMS are the larvæ of the click beetle. When fully grown they average about an inch in length, possess a yellowish to brown body, three pairs of legs in front and a protuberance on the hindermost section of their body. They feed on all roots, tubers rhizomes and fleshy growths in the soil, near the surface in summer but deeper in winter; they pass three or four years as larvæ and finally become parent beetles themselves. The pests are always most virulent in fresh soil and in turf, but they are found in most gardens. Among growing crops they can be dealt with only with difficulty. Soot, artificial manure and mild fumigants hoed in are deterrents and plant stimulants at the same time, but the really effective way to deal with them is by trapping with pieces of potato. In autumn, winter and spring carbon bisulphide is excellent but expensive; while lime, 1 stone mixed with 1lb. crude naphthalene, is almost equally good and certainly much more economical—use 1lb. per square yard.

The leather jacket, that tough, dark green, leathery fellow, 1in. long and plump, is found at the roots of plants always quite close to the surface. Indeed, he works a great deal on the surface, and many of our wrongly maligned birds account for numbers of these pests. I have found the best cure is to use artificial manure of some kind and a poison at the same time; the artificial manure induces migration and encourages a change of diet. The poison may be Paris green or something similar. I recommend powdered Paris green at the rate of a teaspoonful to a pound of ordinary bran. This mixture is a powerful poison which rapidly reduces their numbers and, incidentally, kills all the slugs which are on the prowl at the same time.—LANARKSHIRE.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE KITCHEN GARDEN.

Of late years considerable attention has been paid to the sowing of vegetable seeds in July, particularly during the early part of the month, and the practice has much to commend it. The supply of green peas can be extended by sowing now early maturing varieties, such as Gradus, Early Giant, etc.; also dwarf beans may be sown, preferably in a position where they can be protected from slight frosts in the autumn. If cabbages are needed about October, seeds are sown thinly in lines 15ins. apart, the seedlings being thinned to a foot, and not transplanted as is the usual method. Cauliflowers may be treated in the same way. Where the crops of beetroot and carrots are poor, the opportunity should now be taken to make up for lost time, selecting a turnip-rooted variety of the former, and a short-horn form of the latter. New potatoes are always appreciated, and old tubers of Sharpe's Express planted now will furnish a supply in October. If onions are needed for salads, a few lines of A1 should be sown, also kohl-rabi, a vegetable that finds little favour in this country. Continue to sow lettuce, both cos and cabbage varieties, spinach, mustard, cress and turnip.

THE FLOWER GARDEN.

Bedding Plants.—In some gardens plants of a sub-tropical nature are used for bedding purposes, and to be effective they must be fair examples when put out. They embrace eucalyptus, Grevillea robusta, Aralia Sieboldii and others, and they can be raised from seeds sown now. Directly cuttings of the bedding pelargonium Paul Crampel are available a start should be made to work up the stock for next season. Early struck plants pass safely through the winter: late cuttings are liable to damp off. Many of the popular gladioli will be pushing up their flower spikes, and they should be made secure to neat stakes, otherwise many of them will be spoilt. This remark applies to Galtonia canadensis, watsonia and alstroemeria, although the latter, if afforded a somewhat sheltered spot, rarely needs support beyond a few twiggy shoots here and there among the growths. The hardy cyclamen is a charming plant, and there are numerous species and varieties in commerce. The present month is a good time to make colonies near the base of large trees, along drives, and in the semi-wild garden. Established plantations should be top-dressed with leaf-mould or old potting soil. May-flowering tulips lifted a few weeks ago are dried off in their temporary bed, and now they should be taken up, placed thinly in boxes and stored in a dry shed. When an opportunity occurs, clean and grade them, and then they will be ready for planting in October or November.

OUTDOOR FRUIT.

Strawberries.—These seldom fail to produce a crop of fruit, but if quality is desired the bed should be renewed every third year; the best plan being to plant a few fresh lines each season and discard the corresponding number in the old bed. Directly the fruit is gathered, remove all runners, weeds and dead leaves, and give the ground a good hoeing. Plants that have ceased to be profitable should be grubbed up, and the ground prepared for some other crop. In the meantime, a fresh part of the garden should be got ready for the new plantation by deep digging or trenching, and at the same time incorporate a liberal quantity of partly decayed manure. The runners should be planted in August in lines 18ins. apart, and a space of 15ins. allowed between the plants.

American Blight.—In spite of winter spraying this pest is most persistent in several gardens, especially on the apple trees. If time can possibly be found, the affected parts should be painted over with an ordinary sash tool dipped in methylated spirit or ordinary paraffin.

Plums.—There appears to be a fairly good crop of plums in some areas, and where the fruits have set thickly a large number should be removed at intervals. Trees producing large crops should be fed with liquid manure or a recognised fruit fertiliser. Pinch back the side growths to the third or fourth leaf, to assist in the formation of fruit spurs, the leading shoots are allowed to develop, also other growths needed for extension.

If green or black fly appears, spray at once with a solution of quassia extract. Soft or rain water ought always to be used.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

FRUIT UNDER GLASS.

Melons.—When the young plants in frames have made a couple of rough leaves pinch out the points. The resultant side shoots pinch at the fifth leaf, and this pinching will suffice until a good show of fruit is visible. Choose the best atmospheric conditions possible for pollination. When the fruit begins to swell select the finest to constitute the crop, gradually removing the others. Stop the shoots one leaf beyond the fruit and by timely pinching avoid unnecessary growth. The plants to produce ripe fruits by the end of September and early October from a June sowing are usually planted much closer than earlier batches. Put out the plants about 8ins. to 1ft. apart, and by this system overgrowth is restricted, the trellis quickly covered and an even "set" is earlier obtained. Retain the most promising fruits on each plant, suppressing all others.

Tomatoes.—In Scotland the game is not worth the candle, but the chance of pulling a dish of tomatoes at Christmas might appeal to some. Sow the variety Winter Beauty now. Grow in the cool to procure sturdy plants in 10in. pots. Maintain an even temperature of 60°, using fire-heat when needful, suppress all side growths, while watering and feeding are carefully attended to. Main crop tomatoes in bearing will require plenty of water and liquid manure. In the latter ring the changes from organic to inorganic by dissolving ½oz. each of nitrate of potash and phosphate of potash in one gallon of water. Assist the plants to set fruit by gently tapping the stems at midday when the flowers are open. Severe defoliation is to be deprecated, but overreaching foliage impeding the light may be removed when fruits are ripening. If white fly is a nuisance, fumigate frequently with "Cyanogas." Use this slightly less than the purveyors' directions to begin with. A little experience will teach the amounts required for efficacy.

Grapes.—The bunches in the early Hamburgh house will soon be fit to cut. Promote ripening conditions by discontinuing "damping down," full ventilation on suitable days, leaving a "chink of air" on the top ventilators all night. Have sufficient heat in pipes to ensure a night temperature of 60°. Muscat grapes are still growing freely, and the borders will need watering and feeding regularly. The houses should be "damped down" frequently in hot weather, kept an even night temperature of 65° to 70°, and ventilated early in the mornings to avoid scalding. If red spider or thrips appears, dust with flowers of sulphur or sponge the leaves with a nicotine wash. By experience and observation I am convinced that mildew is the pest most to be feared in houses planted with young vines. It appears in the form of a greyish white powder, and the leaves fail to develop properly, with short internodes on the canes. For vines attacked present remedies to apply are sulphur rubbed on the leaves and canes or spraying with liver of sulphur. Keep the atmosphere less moist and regulate the ventilation to avoid draughts.

Peaches and Nectarines.—The temperature of the houses should increase with the swelling of the fruits and at the last swelling may rise to 65° with free ventilation. Routine work requires that the trees do not suffer from lack of water at the roots, this being fatal to success. Afford mulchings of old dung to encourage fibrous root action over the surface and to supply nourishment to the trees. Syringe at intervals, being guided by external atmospheric conditions, to keep insect pests in check as well as to promote growth. The quantity of fruit a tree will carry is best left to the judgment of the man on the spot. But overcropping, with its consequent strain on and exhaustion of the tree and other incidental troubles, should be guarded against.

Figs.—In these houses the concern of the moment is the ripening of the second crop. Promote this by all the known means, removing shoots that shade others to allow maturation of the wood. As the third crop is rarely procurable, it is not worth while forcing the trees to effect its production.

Doune, Perthshire. W. MCCARRELL.

CONSERVATORY AND GREENHOUSE.

Calceolarias.—Seed of the herbaceous varieties should be sown towards the end of the month in a cool greenhouse. The seed pans should be watered several hours previous to sowing, and the fine seeds evenly sown on the surface and covered with just a sprinkling of sand. Cover the pans with a piece of glass and shade until germination takes place. When fit to handle the seedlings should be pricked off into pans of light rich compost, placing them in small pots when large enough, afterwards potting them on as required. Grow them under cool, moist atmospheric conditions. They are very subject to attacks of green fly, which must be prevented by frequent light fumigations. Calceolarias belonging to the sub-shrubby section—which includes C. Burbidgei, C. Clibrani, C. integrifolia, C. Allardii and C. violacea—should be propagated by means of cuttings, which will root in a close case in a cool house. C. Burbidgei when flowered in 6in. pots is very useful for furnishing the stages, while grown in large pots it makes fine large specimens for the beds. C. violacea belongs to a small section with helmet-shaped flowers, and is hardy outdoors—when planted against a wall—in the west; in the colder parts of the country it makes pretty plants for the conservatory, and is seen at its best when planted out in a well drained bed or border in a cool house. The beautiful race of garden hybrids which have resulted from crossing the large herbaceous varieties with C. cana, a small-flowered species from Chile with purplish-violet coloured flowers which are violet-scented, are very beautiful, and it is surprising that this charming set of hybrids is not more generally grown, as they are easily raised from seed or cuttings and succeed under the same cool conditions as are afforded other calceolarias.

Cestrums are very useful for covering pillars or back walls in the conservatory, the sorts generally seen are C. elegans and C. Newellii; but the distinct C. aurantiacum is deserving of more general cultivation, for, although it is equally good for clothing pillars or wall spaces, it may also be successfully grown as a pot plant. They may be successfully rooted at any time, but the present is a good time to raise fresh stock by means of cuttings, which root readily in a close case. Cestrums grow freely when planted out and require little attention beyond keeping the growth regulated and thinned out. They are rather dirty plants, being subject to attacks of mealy bug, green and white fly, all of which must be guarded against.

Salpiglossis.—This annual, with its many beautiful varieties, is very useful for conservatory decoration. It is, however, by no means an easy plant to grow successfully. This is especially true in the neighbourhood of London, where it suffers from the effects of frequent fogs. When grown in pots this plant takes longer than most annuals to reach the flowering stage; if required to flower during May of next year, seed should be sown from the middle to end of July in a cool greenhouse. The young seedlings should be pricked off into pans or boxes, afterwards transferring them to small pots, potting them on as they require it. For wintering they should be well established in large sixties or 48-sized pots. This plant requires careful watering at any time, but special care in this respect must be observed during the winter months, when they should be given a position well up to the roof glass in a warm, airy greenhouse. Early in the New Year they should be ready for a shift into 6in. flowering pots.

Kalanchoe flammea.—This beautiful plant may be propagated by means of cuttings at this time, as they are of a succulent character. It is not necessary to place them in a case, as they root readily when stood on a bench or shelf in a warm greenhouse. It can also be raised from seed, which is best sown during early spring. Plants raised from cuttings at this time should flower next year. They should be grown in a warm, airy greenhouse. Like most plants of this character, good drainage is important, and although Kalanchoe flammea grows in any good potting compost, it is an advantage if some old mortar rubble, or old broken bricks, can be added to the potting compost. Also, water at the root should be carefully afforded during the winter.

Kew. J. COUTTS.

The safest time to plant
PYRETHRUMS

IF you want pyrethrums to do well—and every garden-owning lover of flowers must—move the plants in late July or early August—the safest time of the year.

If you need fresh plants, either send for our catalogue and choose for yourself or, here and now, order the low priced collection of twelve excellent varieties offered below, for 7/6 carriage paid, for delivery in July or August:—

	Carminetta ..	Deep carmine rose.
	Fairy	Cherry red with white ring.
	General French ..	Deep rich scarlet.
	George Wallace ..	Rich crimson.
	Grandiflorum ..	Rose pink.
	King of Spain ..	Crimson rose.
d	Madame Meunier	Pale flesh pink.
	Miss Hawley ..	Pale pink.
d	Mont Blanc ..	Pure white.
	Oxeye	Deep rose.
	Standard	Bright rose.
d	Queen Mary ..	Pink shaded salmon.

d—Denotes double.

One plant each of the 12 varieties, 7/6 post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

GARDEN TECHNIQUE

THE GREENHOUSE

SUMMER TREATMENT OF PEACHES AND NECTARINES.

IT frequently happens that peach and nectarine trees are well looked after during the midsummer months while the fruits are ripening, and are afterwards much neglected. These notes are not for the instruction of expert growers, but for those cultivators who have not had much experience in their management.

Now, with regard to the feeding of the trees—I am referring to those grown under glass—while the fruits are stoning, a period of twenty-one days, the specimens do not swell perceptibly, and manures, especially those kinds that are very stimulating in their action, should not be applied. It is much the safest plan to apply clear water only.

Then, directly the fruits are seen to be swelling, feed liberally, not with strong doses, but weak ones, and every alternate day. Continue the syringing up to the stage when the first fruit begins to soften on one side for ripening, then be content to damp the floor and paths only. Less feeding is necessary now, but clear water must be applied regularly.

While the fruits are swelling, syringe the trees twice every day; ventilate in the morning, early, and close the house, when the trees are syringed in the afternoon, early or late, according to the weather. The close, moist atmosphere is beneficial as regards the health of the tree and the swelling of the fruits. The shoots will continue to grow, but not as rapidly as previously. Avoid any overcrowding, stop those shoots that would cause overcrowding, as shown at *a* in the sketch, and any sub-shoots that grow from points *b*, *b* remove altogether; the buds lower down, at *c*, will remain dormant, as they should. Exposure of all fruits to full sunshine should be the rule at an early stage. Leaves, such as shown at *d*, should be under wires or fruits, then the sun's rays, *e*, will shine directly on the fruit, *f*, and the latter will be coloured dark crimson almost all over.—GEO. GARNER.

CURRENT TREATMENT OF POT CHRYSANTHEMUMS.

THE pots used at the final potting of these plants will soon be quite full of roots if the plants are healthy. Late in the month the first crown buds will be seen in the points of the shoots. If the varieties are naturally late-flowering ones, these early buds must be "taken"—that is they must be retained and all side shoots rubbed off. Some cultivators wait until the buds are thus secured before they begin to feed the plants. But feeding may be beneficial at an earlier date. It will be if the pots are getting filled with roots. Weak liquid manure, clear soot water and concentrated fertilisers used according to the directions, will strengthen the plants prior to bud formation, and after the buds are secured the feeding can be increased in strength a little. All main stems should be tied to strong, neat stakes, so placed that the maximum amount of air will reach the leaves and stems alike. Side shoots should be removed, also any weeds in the pots. Avoid any overcrowding of plants. Keep the foliage clean; use tobacco powder in the evening to eradicate aphides, and syringe it off the next morning. Sprinkle soot on the ground near by, to keep away the leaf-miner fly.—CHRISTCHURCH.

FRUIT AND VEGETABLES

LAYERING STRAWBERRIES.

A Seasonable Reminder.

QUITE the best way of increasing strawberry plants is by means of the runners, which are usually produced in great abundance. Great care should be taken to avoid runners from those plants which are known to be barren, as the unfruitful tendency is sure to be handed on. Generally speaking, it is best to concentrate on the first plants produced by the runners. Now and again, if the second plant appears to be very strong, this may be worth securing, but subsequent plants are not worth bothering about. Of course, the runners are entirely supported by the parent plants until the new plants on the trailing stems are able to get a roothold. This they will do readily if they are resting on ground that is suitably moist and not too hard. Where a sufficient number of pots are not available the layering may be carried out straight on to the natural ground. Direct the growth of the runners well away from the parent plant to the space in between the rows. Loosen the soil and, if it is dry, water thoroughly; just when the roots are beginning to appear from the plants borne on the runners place under each some light leafy mould. At this time pinch back the runner from the far end so as to throw the vigour of growth into the new plant. A light pegging down is helpful to keep the runner from straggling about. When the rooting is complete the rooted specimen may be lifted with a ball of earth after cutting the runner free.

On the whole, better results are secured by layering in pots. Pots of 3in. size should be used, and these are filled with light soil. Each pot is plunged to half its depth in the ground, and it is necessary to see that the soil it contains is kept moist should the weather happen to be dry. In

Digitized by Google

layering strawberries two points should always be kept well in mind. Choose only those runners which are vigorous in growth and never cut the new plant from its parent until roots are being freely produced. If a severance is attempted too early the little plant will receive a severe set-back, which is evidenced by drooping leaves, some of which may die away altogether.—S. LEONARD BASTIN.

TRADE NOTES.

IF a garden is to look clean and tidy, the paths and the walks must be clean and free from weeds and moss, and at this time of the year, when a hundred and one little odd jobs have to be attended to, it is no easy task to weed these paths. It is tedious and occupies valuable time. A most convenient and thoroughly effective method of destroying these weeds lies in the application of Eureka Weed Killer. At the same time as one cleans up the paths and walks it is advisable to give the lawn a dressing of Eureka Lawn Sand, which revivifies the starved grass and stimulates fresh growth in bare patches, while it greatly helps in the destruction of many surface weeds, such as daisies and buttercups.

SWEET PEA COMPETITION
£50 IN PRIZES

RULES.

A list of your choice of the six most popular sweet peas to be sent in in order of preference on the coupon to be found on page IV of this week's issue of THE GARDEN. *No alternative* varieties will be allowed in the one list, but readers may send in any number of lists, provided that they are written on the special coupon to be found in this and the following issues of THE GARDEN.

Coupons must reach this office not later than Saturday, July 17th (after which date no coupons will be accepted).

The popular vote will be final, and no correspondence will be entered into over this competition.

Envelopes must be marked *Competition* and addressed to THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

The Editor will not be held responsible for letters missing in the post.

The result will be announced in THE GARDEN in the issue of August 28th.

The prizes are awarded to those whose list corresponds most closely to that arrived at by the popular vote.

If two readers tie for the first place, the first and second prizes will be equally divided; if two for the second place, the second and third prizes will be equally divided.

The Editor's decision on all points will be final.

PRIZES.

1ST PRIZE.—Goods worth **£30** from any advertiser in the pages of THE GARDEN.

2ND PRIZE.—Goods worth **£10** from any advertiser in the pages of THE GARDEN.

3RD PRIZE.—Goods worth **£5** from any advertiser in the pages of THE GARDEN.

20 CONSOLATION PRIZES of **5s.** each from any advertiser in the pages of THE GARDEN.

VOL. XC.—No. 2849. JULY 10, 1926

IVY ON TREES

I HAVE been much struck lately by the enormous number of trees throughout the country that are covered by ivy. Is it increasing or have I noticed it more during the past year, once my attention has been drawn to its prevalence? Wherever you go, whether in the garden, the woods or the roadside, it is astonishing to note the number of trees through whose branches it twists and twines. I shall give one instance out of dozens that I have noted: the road from Cambridge to London by way of Bishop s Stortford and Epping is lined for miles with magnificent elms. There is hardly a tree whose trunk is not clothed with this pest. Mr. Bean says in his "Trees and Shrubs" that he thinks that no damage is done to the tree as long as the ivy is confined to the trunk and main branches and has not reached the leaf shoots. That may be; but how are you to prevent it from reaching the tips of the branches? Once ivy has got its grip on a tree I maintain that it will invariably smother it in time. It may take many years, but sooner or later it will snuff out the tree's life.

Where I really join issue with Mr. Bean is over his statement that that an ivy-laden tree is one of the most beautiful objects of a winter landscape. That I flatly disagree with. Surely there can be nothing more lovely than a fine clean bole of a tree standing up in the winter light with its canopy of delicate tracery above it? Why go and ruin the clean-cut lines with a shapeless smother of green leaves just because they are evergreen? Ivy has its uses as a good evergreen climber. Nothing is more suitable in a churchyard or to clothe the walls of some ugly building; but ivy is far too common. Its rampaging precocity has slipped under our noses unnoticed, with the consequence that for every ugly spot it hides there are ten where its continued existence is an eyesore. It is far too widespread, and should be kept in check. On the question of ivy as wall clothing everyone has their own personal opinion. The only thing is that owners of houses should make up their minds once and for all whether they like it or not, for the removal of old ivy from a wall is a costly process owing to the amount of pointing that has to be done on the wall surface afterwards.

I have kept a few notes on the trees on which I have found it most prevalent. It is probably more of a pest on the elm than on any other tree, and I should go so far as to say that in some parts of the country 40 per cent. of all elms have ivy on their trunks. It has no objection to all prunus and pyrus and seems to be particularly partial to thorns of all kinds. Sycamores it will also attack, but I cannot remember ever having seen it on a horse chestnut or on an ash, and certainly not on an oak or ilex or beech. Conifers it seems to have a rooted objection to, with the exception of larch and Scots pine, which I have occasionally seen slightly clothed though never smothered. Readers may be able to supplement this short list and tell us if it is the nature of the bark to which the ivy objects. The forms that appear to be most vigorous on trees are the common Hedera Helix and its varieties deltoidea, ovata and sagittæfolia. Unfortunately, I have no data as to the speed with which it will smother or clothe a tree. I have known it to climb up a sycamore trunk 12ft. in one year while in a young state; but, probably, once the ivy has a solid trunk of its own the growth will be slower.

The only way to kill ivy on a tree is to cut through every stem and to keep on cutting every year. It is a slow process, for the roots are long lived, but this consistent cutting weakens them in time and in about four years the ivy will be dead. It is as well to examine the base of the tree carefully to see whether any shoots have been overlooked, for they will go in odd directions once the main stem has been cut. It is hopeless to try to pull down ivy when green. It will take at least a year to wither sufficiently to come away when you give the main stem a good pull.

In my opinion ivy has no place on our trees. It savours too much of a parasitic growth that squeezes and sucks the life out of its host. Of course, it is no parasite, but it looks out of place. Many will no doubt disagree with this wholesale condemnation, but I hope that they will use their eyes and see to what an extent ivy has invaded our woodland and our trees and will do something to keep it in check.

E. H. M. C.

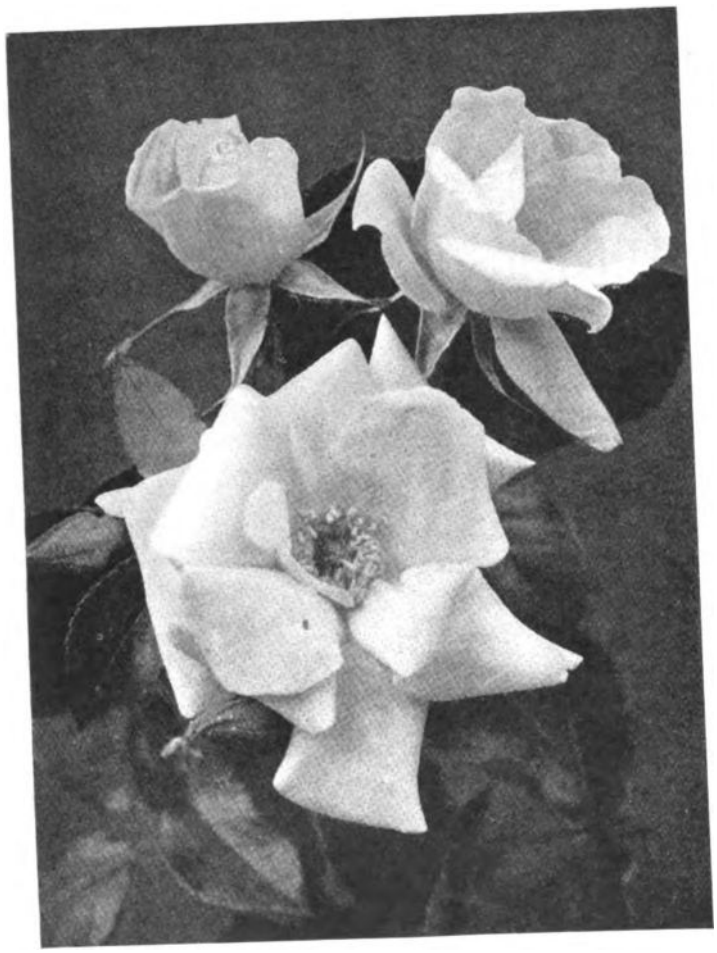
THE SUMMER ROSE SHOW



ROSE BILLY BOY, A NEW CANARY YELLOW HYBRID TEA.

THE culminating peak in the calendar of the rose enthusiast was reached on Friday and Saturday last, on the occasion of the great annual Rose Show held under the auspices of the National Rose Society at Regent's Park. This is the Jubilee year of the Society and records an event of considerable importance in the annals of the horticultural world. This exhibition, held in an ideal setting, increases in popularity year by year, and serves as an indication of the high esteem in which our national flower is held. This year Her Majesty graced the Show with her presence and showed considerable interest in several of the exhibits. Once again, Mr. Courtney Page, the secretary, and his able committee of assistants deserve congratulation on the excellence of the arrangements. It is largely that fact, combined with the attraction of the rose itself, which has greatly added to the prestige of this Show and helped to add considerably to the ever-increasing membership of the Society.

On this occasion the majority of the roses in the exhibits were scarcely up to the high level which is generally attained. The unfavourable weather conditions experienced during the few weeks prior to the Show, no doubt, were largely responsible for the poor appearance of many of the roses, to which the heat of the tents in which they were staged added considerably. The string of novelties, which are one of the features of the Show and always attract the most attention, was as long as ever. Perhaps, as with the groups, the standard was below the ordinary, but, nevertheless, many fine things were to be seen. The shades of many of the new varieties were rather striking and out of the ordinary, suggesting a new break in modern rose production. Several of the novelties were selected to appear at the Autumn Show for competition in the Clay Challenge Cup.

Every year the general exhibits of flowers in season are on the increase, and on this occasion many fine delphiniums, sweet peas, carnations and other general herbaceous flowers were on view. The many exhibits of sundries were also of interest, including displays of garden furniture suitable for inclusion in the rose garden. The products of the various fungicide and insecticide firms made a special appeal to the rose grower, and from an educational standpoint it is most necessary that these exhibits should be visited. It is only by care and attention in the clean, healthy cultivation of the rose that the high-class blooms, as seen at Regent's Park, can be attained by the majority of amateur rose enthusiasts.

The arrangement of decorative roses is an art in itself, an art in which individual taste can play an important part, and yet the table decorations seen at the Show, although of a high standard, did not show much diversity in style. There was too much similarity in arrangement and one wishes that exhibitors would sometimes use other varieties than such popular roses as Mme. Butterfly. In the ladies' artistic classes one of the most successful of all exhibitors was Mrs. Courtney Page. Irish Elegance and Irish Fireflame made a pleasant combination and were gracefully used by Mrs. Colston Hale to decorate a table and were considered by the judges as worthy of first prize. An attractive second prize table was staged by Mrs. Oakley Fisher.

In the amateur section for the Champion Trophy, several fine groups of roses were staged, and among them the collection of roses put up by Dr. R. C. Turnbull received the Edward Mawley Memorial Medal for the most meritorious exhibit in certain amateur classes. This group contained many perfect roses, including beautiful blooms of Lady Inchiquin, Betty Uprichard and Padre. Mr. J. N. Hart also had a good collection of roses, which were not only of good quality, but well arranged. In a group of cut roses Mr. H. R. Darlington showed some of the finest roses seen in any of the amateur classes.

The baskets of roses and those shown in exhibition were, in the majority of cases, not up to their usual standard of excellence. Some of the blooms were not in good condition, either blemished or past their best. One of the exceptions was the exhibit of Mr. G. Marriott, who showed two baskets of particularly good blooms of Lady Pirrie and Betty Uprichard and, in another class, baskets of Mrs. Henry Bowles and Mabel Morse.

The Mattock Cup was won by Mr. A. C. Turner for vases of twelve distinct varieties. This collection deserves special mention, as the condition of the flowers and foliage and shape of the blooms were excellent. A few of the most outstanding varieties were Princess Mary, Padre and Betty Uprichard. Mr. A. L. F. Cook won the Holyroyd Cup for six distinct varieties arranged in vases. In this class competition was particularly keen and there was little to choose between the various exhibits. Mr. R. H. Ling showed a number of shapely blooms, the good depth of colour was noticeable in the varieties Betty Uprichard and K. of K. Dorothy Page Roberts was, perhaps, one of the best roses shown by Mr. V. E. Cribb in his prize group. It was encouraging to see the interest taken in rose growing by amateurs whose gardens lie within ten miles of Charing Cross. Many of the blooms were quite up to the standard of the roses grown in pure country air.

Mr. F. H. Fieldgate won the Edward Mawley Challenge Cup for a box of twenty-four varieties. This year the Lamplough Challenge Cup went to Mr. N. E. Moore, whose roses were of good texture. The old favourite, Dean Hole, was shown by the Rev. F. R. Burnside. Mr. G. Daubeney's box of twelve exhibition roses included a perfect specimen of Mrs. C. Lamplough, and this rose was awarded a medal for the best bloom. There were a number of entries for the Bert Cant Memorial Cup, and competition was keen. Although Mr. G. A. Freestone gained the highest award, the box of roses shown by Mr. E. Holroyd and grown in Finchley were worthy of special mention. In the latter case the varieties selected were varied and the quality of the blooms excellent.

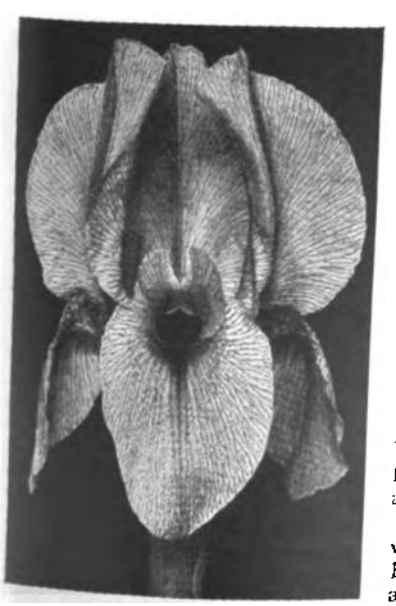
REGELIO-CYCLUS IRISES

IN recent years the germanica or flag irises have been a prominent feature at our spring flower shows. This section of the bearded iris has responded in a truly remarkable way to the efforts of the plant breeder and has won for itself a well deserved place as a thoroughly hardy and easily grown plant, which, given lime and a reasonably dry and sunny position, will thrive in almost any soil. It is only natural that they should have received the praise they merit in the horticultural Press, but their glory has somewhat eclipsed other sections which are deserving of more attention.

REGELIO-CYCLUS IRISES.
Showing part of a bed which has not been disturbed for four years.

The Regelio-cyclus irises are a case in point, and certainly deserve to be more generally grown. While conscious of the general abuse of adjectives which appears to be unavoidable in attempting horticultural descriptions, I do not hesitate to say that the colours and curious veining of the Regelio-cyclus irises would be correctly described by the use of such adjectives as "amazing," "extraordinary," "weird," yet "beautiful." They have, however, been described by authorities as "difficult to grow," and it is probably for this reason that amateurs hesitate to make the attempt. One would hardly say that dahlias were difficult to grow, but having successfully cultivated the regelio-cyclus irises for some years, I do not consider them more difficult or troublesome to grow than the dahlia. Those who attempt, and succeed in growing, a plant considered "difficult" are amply rewarded by results.

Before dealing with the question of cultivation, it may be interesting to consider the origin of these beautiful irises.



REGELIO-CYCLUS IRIS OSIRIS.

The Regelio-cyclus irises, as their name implies, are a hybrid group produced by crossing the Regelia iris and the Oncocyclus iris.

A typical example of an Oncocyclus iris is I. Susiana (The Mourning Iris), which bears one magnificent, if somewhat sombre flower. These irises are natives of Asia Minor, Syria and West Persia. Imported rhizomes planted in suitable positions can be well flowered the first season, but generally fail to flower again and gradually die away.

The Regelia irises, which are found in Russian Turkestan, are a small and closely allied group, bearing two and often three flowers on a stem, and are less exacting as to soil and climate. Typical examples of this section are the well known I. Stolonifera and I. Korolkowi.

To the late Sir Michael Foster in this country, and to Mr. van Tubergen in Holland, we owe the first hybrids between these two groups, which are known as Regelio-cyclus. These wonderful hybrids carry from the Oncocyclus the characters of size and marvellous colour combination, and from the Regelias the habit of bearing two or three flowers on a stem, and easier cultivation in this climate.

The origin of these two groups indicates the kind of position which the hybrids would require—namely, a dry and sunny position, the hotter the better. Such a position is often available on the south side of a house. Here it is usually very dry on account of the aspect, radiation from the wall, overhanging eaves, and drainage which the foundations provide; moreover, it is often difficult to get other plants to succeed in such positions, but here we have an ideal spot for the Regelio-cyclus irises.

Failing this, the south side of a hedge is often suitable. Having decided on the site, look to the drainage and if necessary, remove about 18ins. of soil and put in about 4ins. of broken brick and mortar rubble. Before replacing the soil, mix with it a good proportion of sharp sand and mortar rubble, but if mortar rubber is not obtainable, lime or broken chalk will serve the purpose. The irises should be planted about the second week in October, 8ins. apart and for a first attempt, quite a small bed will suffice. If the soil is very poor, a light dressing of cow manure may be applied in March.

Growth commences in November and the plants come into flower April-May. During this time, they do not object to the winter rains, but as soon as they have finished flowering they require to be dry and receive as much sun heat as possible. This is the critical period, for if the plants are not thoroughly ripened they will not flower and their constitution will suffer. This, then, is why they are described as "difficult to grow"; but, fortunately, this may be easily overcome by a little common sense. In a hot summer, the plants may be safely left in their

REGELIA IRIS KOROLKOWI.

Digitized by Google

positions. If, however, the summer is dull and wet, they will require to be either protected by means of lights, which will keep off the rain and concentrate the sun heat—or if lights are considered unsightly, the plants should be lifted about the middle of July, put into open trays, partly covered with sand and placed in full sun on a greenhouse shelf or in a frame, where they may be well baked until October, when they can be replanted.

As soon as the plants begin to grow, keep a sharp look-out for slugs and snails, which are very fond of the young shoots. Any usual method of dealing with these pests may be adopted, but it is important that it be carried out systematically as early damage will greatly weaken the plants.

The only disease which is likely to give trouble is the fungus Heterosporium gracile, which causes rusty spots on the leaves. I have tried a large number of suitable preparations for this, but without success. However, as the fungus usually appears late in the season it does not seem seriously to damage the plants.

I. SUSIANA, A TYPICAL EXAMPLE OF AN ONCOCYCLUS IRIS.

The Regelio-cyclus irises are splendid as cut flowers and I have found the following varieties most satisfactory: Artemis, Isis, Osiris, Beatrix, Hecate and Charon, which I place last because, although its fine brown flowers are most distinct and attractive, as a plant it is one of the most difficult to grow. I will not attempt a description of these varieties as it is beyond my power.

I would mention that the position and soil suggested is also ideal for the Regelia irises and a few I. Hoogiana should certainly be included, as this is one of the most beautiful of all irises, being a pure azure blue.

I trust that these few notes may induce more amateurs to grow these wonderful irises and for those who are unable to afford named varieties, I would suggest mixed varieties, which are quite inexpensive.

G. N. BUNYARD.

IRISES FOR THE BEGINNER

THE following short note is not meant for the *élite*, but for the beginner who has just taken up, or is thinking of taking up, the cultivation of this charming and beautiful class of plants, which in recent years have become increasingly popular. In this large genus there are a number of species which are admittedly difficult of cultivation, due very largely to climatic conditions. I. tingitana and the Oncocyclus group may be given as instances; but the beginner need not worry about this, for there is ample choice of strong-growing and free-flowering irises for the tyro to start with.

Irises may be expected to flourish in almost any good garden soil; in fact, so accommodating are many of the German flag irises that they are often abused, being planted in situations and under conditions that are almost certain to lead to failure, for even this robust class must not be expected to be a success if they are planted in dark, sunless positions, or if the rhizomes are overgrown with dwarf carpeting plants as one sometimes sees.

As the large bearded flag iris, represented by various groups generally known as germanica, variegata, pallida, aphylla and squalens, are the most easily grown, they form the section with which the beginner should make a start. The ideal soil for this class of iris is a good, well drained medium loam. On the other hand, they may be expected to, and do, flourish on a wide range of soils, varying from heavy clay to light gravelly soils; the former, if necessary, can be improved by drainage and the addition of gritty material, and the latter by good loam and well decayed manure. The ideal position should be open and sunny, although many of the strong-growing varieties flourish in small enclosed gardens; in this respect they have the inestimable merit of being good town garden plants, the common purple German iris being specially useful for small town gardens.

The ground should be well worked, digging in some well decayed manure. A dressing of bone-meal, at the rate of 6 oz. to 8 oz. per square yard, and also of lime should be given; this latter is very essential in town gardens, the soil of which is usually acid from atmospheric deposits. Basic slag, at the rate of 6 oz. to 8 oz. per square yard, is very useful and may, to a certain extent, take the place of the lime. The slag is generally applied during November; but, as a matter of fact, it may be used at any time while the beds or borders are being cultivated. In dealing with the planting or replanting of this section of irises, there is considerable difference of opinion. As a matter of fact, there is a wide period over which they may be more or less successfully planted; but there is no doubt that the ideal time for planting or replanting is just when they have finished flowering; they have thus ample time to make plenty of new roots before winter, and there is a much better chance of getting a good show of flower the first season.

On the other hand, if circumstances do not permit of planting soon after flowering, it may successfully be done during autumn or even spring. When planting, care must be taken not to plant too deeply, for naturally rhizomes run on the surface; thus they get full exposure to sun and air, which is so essential for free flowering. The bearded flag irises may, roughly, be divided into three groups: Group 1, Iris pumila, or dwarf bearded iris, which usually flowers during April. Group 2, which may be

Digitized by Google

called intermediate irises, and generally result from crosses between I. pumila and the later flowering I. germanica, and may be regarded as May-flowering. Group 3 includes the tall June-flowering bearded irises; they embrace the sections known as pallida, variegata, squalens, neglecta, amœna, etc., but they are so intermixed by hybridising that it is somewhat difficult to separate them, and this is no place to enter into the vexed question of classification.

All the larger-growing flag irises may be grown in the herbaceous border, taking care that they do not get overgrown with strong-growing plants. Where a large collection is grown, a special iris garden may be devoted to their cultivation, either in beds or, better still, in a more informal manner, perhaps the best effects being obtained if they can be planted in the vicinity of water.

Iris sibirica (of which there are several fine varieties) is very free flowering, and specially suitable for massing by the waterside or in moist situations; although it can be grown successfully in beds, especially if it can be watered during dry spells.

The following are all fine varieties, *viz.*, maxima, George Wallace, Kingfisher Blue, orientalis, orientalis Emperor, Snow Queen and Perry's Blue. While the large flag irises should be broken up and replanted every third or fourth year, I. sibirica is best left undisturbed to make large clumps, keeping them going with mulches of well decayed manure.

Turning now to the bulbous irises that should appeal to the amateur, we have the many beautiful varieties of the Spanish iris, I. xiphium, and the later-flowering English iris, I. xiphioides. These are specially useful for furnishing a supply of cut flowers, and for planting in masses in beds and borders. Their successful cultivation presents no difficulty, as, generally, they succeed in any good garden soil, especially if it is warm and well drained. A large bed of mixed Spanish irises underplanted with mixed violas in blue, white and yellow, makes a very charming combination. Both English and Spanish irises may be planted from the end of August to October, or even later.

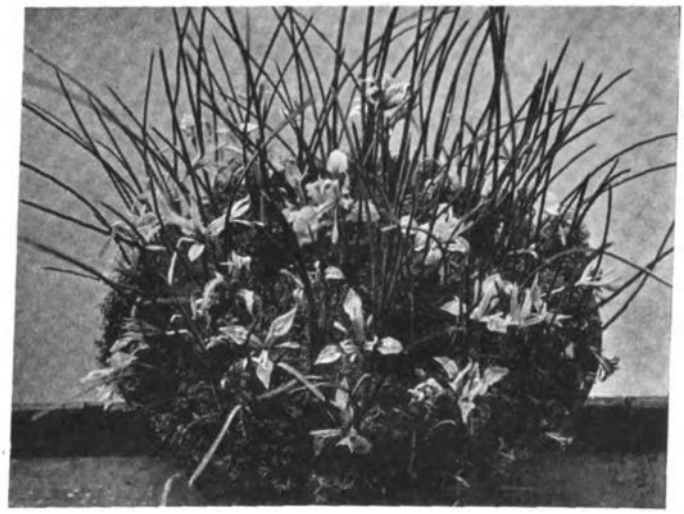
There is now a race of so-called Dutch irises which may be described as a large-flowered, early strain of Spanish irises. They flower about a fortnight earlier, which is a distinct advantage where ground has to be cleared for summer flowering plants.

There are quite a number of species of iris with tuberous-roots or bulbs; they include such charming species as I. alata, Danfordiæ, Histrio, histrioides major, orchioides, persica, reticulata and its varieties, sindjarensis and Vartani. While some of them are suitable for the rock garden, they flower so early that their flowers often get spoiled. An ideal situation for them is in a narrow border at the foot of a warm plant house wall. They are, however, ideal for growing in pots and pans for the cold greenhouse, bringing them on for this purpose in a cold frame. Grown in this way, they may be enjoyed in comfort. They are, also, ideal subjects for the small unheated greenhouse, or, even if one has only a cold frame, they may be removed to the dwelling-house when they are in flower. They flower from January to April, and should be planted in the open, or in pots and pans, from August to October. Just one more iris that everyone should grow, *viz.*, unguicularis, syn. stylosa. Its deliciously scented flowers are ideal for picking; they should be pulled out, not cut, when in bud, and opened indoors. They should be grown in warm, well drained borders at the foot of a wall. They must be grown in poor, gritty soil, or else they will produce too much foliage and will not flower freely. They have a long flowering season, usually commencing during November and going on until March.

Weather conditions determining the quantity of flowers produced at any particular time, as a few degrees of frost injure the flowers, it is wise to provide some means of protection, a canvas blind being very suitable. In the colder parts of the country this iris should be worth the shelter of a cold frame. There are several varieties, including a white one, of this iris. One often hears complaints that I. stylosa is difficult to transplant, but there should be no difficulty if it is done during March or April after it have finished flowering; at least, such has been my experience, and I used to have to maintain a large stock for a supply of cut flowers. As already indicated, this note is for the beginner, and I hope that, in a small way, it may prove helpful for those who are taking up the cultivation of this beautiful class of plants.

J. COUTTS.

IRIS SINDJARENSIS, FLOWERS LAVENDER AND PURPLE.



IRIS VARTANI ONE OF THE EARLIEST TO BLOOM.

SERVICE FOR READERS

Though so many subjects are dealt with in each issue of THE GARDEN, it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, whether advice is sought as to—

RESTOCKING A GARDEN, COLOUR SCHEMES FOR GARDENS, THE BEST PLANTS FOR CERTAIN SITUATIONS, WHERE TO OBTAIN NEW AND RARE PLANTS, INSECT PESTS, NAMING OF PLANTS, AND THE HUNDRED AND ONE OTHER DETAILS RELATING TO THE GARDEN—

there is always information available from a staff of expert contributors and consultants; *and there is no charge for this.* It is one of the additional means of Service which THE GARDEN is glad to render to its readers.

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope shall be sent with the enquiry.

All communications should be addressed to the Service Department, THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

NOTES OF THE WEEK

KALMIAS.

THESE American shrubs are a select little company. All of them bear the hall-mark of quality and refinement, and though most of them have been known to our gardens for over two centuries, none has ever become common. And this is singularly odd, for all in general cultivation are quite hardy, they are easily satisfied in any soil that will grow a rhododendron, they are remarkably beautiful in foliage and flower, long-lived and practically pest-proof.

K. latifolia is the largest and perhaps the best for average use. Though not a fast grower it will eventually make a handsome bush 8ft. high and as much through. The glossy evergreen foliage is always attractive, and the bold heads of blossom, 4–6ins. across, are ruby red in the bud, the flowers expanding in various shades from blush to deep rose. Individually, the waxen corollas are shaped like a shallow five-angled bowl, and this formation, together with the curious catapult arrangement of the stamens, is characteristic of the race.

If K. latifolia deserves to head the list, K. glauca runs it very close. But this is a rock garden subject or one for a place at the margin of the bog. But, lover of moisture that it is, K. glauca will be happy in any cool soil, and there, every April, its 18ins. of slender upright growths, with their narrow dark green leaves, will be crested with clusters of cheery rose pink flowers. There is no daintier or more comely shrublet in the spring garden than this.

K. angustifolia is a species one can never be quite sure about, owing to its extraordinary variability, ranging from tiny bushes of 6ins. or so to others of 4ft. It is generally later (June-July) in opening its trusses of rosy blossoms, and does not, to my mind, make such a pleasing bush as either of the foregoing. Still, some of the named forms of this species are very delightful little shrubs.

Though classed as peat plants, the kalmias will, as I have suggested, do in any well drained, lime-free loam with the addition of some leaf-mould. A spring mulch of half-rotted leaves, fine peat moss litter or other retentive material, is very beneficial where the soil is liable to dry out in summer. Really old cow manure is also an excellent thing for kalmias in light land.—A. T. J.

ANTHURIUMS.

Useful and Ornamental Greenhouse Plants.

AMONG the well known foliage plants of our hothouses the following two species of Anthurium are frequently met with in our glasshouses and sometimes even in our living-rooms. When flowering they are of great beauty on account of the large, intensely coloured spathes. Of A. Scherzerianum, which is a native of Central America, have been raised numerous garden forms of which the spathe is variously shaped and coloured. One of the commonest has a dark red spathe, and the yellow coiled spadix contrasts strikingly with it. There are also white, rose-coloured and parti-coloured forms, and others with an orange or salmon rose spathe. These beautiful inflorescences last a long time. One can keep flowering plants in the living-room for more than two months. The curled spadices of A. Scherzerianum give the plant a curious aspect.

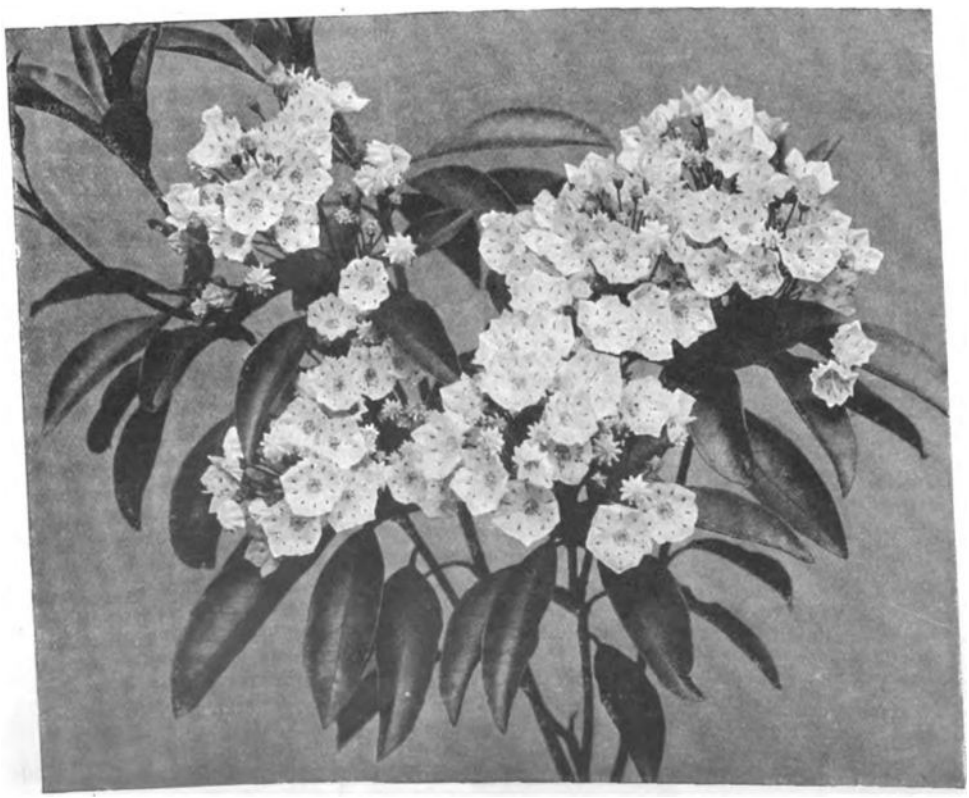
Of the other species, A. Andreanum, which comes from Columbia, the flowering parts look somewhat different. The spathe has a distinctly cordate base, and the spadix is very straight, with more prominently marked white tips to the stigmas. There are several fine varieties, too, of great ornamental value.

Healthy, well grown plants of both species have fine deep green foliage. In A. Scherzerianum the oblong-lanceolate leaves stand upright; while they are drooping and broadly ovate with a deeply cordate base in A. Andreanum. When large plants are covered with numerous flower-stalks bearing the intensely coloured spathes, few foliage plants of the glasshouse make such a striking display.

Neither species is very pretentious as to its cultural requirements. They are best planted in flat rather than deep pots in a mixture of rough fibrous loam and peat with

ANTHURIUM ANDREANUM FROM COLUMBIA.

a little sand, charcoal and also sphagnum. Good drainage is essential. One must be careful not to hurt the roots when transplanting. Well rooted plants need plenty of water during the growing season. The temperature should not fall below 45 to 50 degrees during the winter. The foliage is best in a shaded position.—CAMILLO SCHNEIDER.



THE BEST OF THE KALMIAS, K. LATIFOLIA.

OLD ROSES.

THE favourite roses of to-day are comparative youths in the history of horticulture, most having been introduced during the last fifty years.

One of the earliest in cultivation is the Old Moss rose, a type rarely seen in gardens to-day. The old varieties of this rose were invariably grown on their own roots, the bushes being left practically unpruned and little care given them. They do not make pretty bushes as they are straggly and untidy; but, left alone, they bloom profusely and bear a wealth of beautifully mossed flowers, possessing the most delightful fragrance.

Nor is the cabbage or Provence rose in favour to-day; indeed, it is only to be found in cottage and old country gardens, as a rule, where it may have been growing for a century or more. It has all the faults of the former type—if we may call them faults—but it atones for them all at the end of May, when its branches are covered with the real old-fashioned full roses of charming fragrance; one cabbage rose in a small garden floods it with perfume. The white variety of this old rose is very pretty in bud, these being nicely mossed and dainty.

Rivalling, and perhaps outclassing, the former in some respects is the damask rose, which crowns itself with flowers all through summer, blossom which has a powerful, penetrating, but admirable scent. The York and Lancaster has much the same habit and is almost equally floriferous; its flowers are of a striking nature, consisting of a slightly tinted white, splashed deeply and prominently with crimson. Suggesting the union of England's two great parties after the Wars of the Roses, it has nothing whatever to do with that historically.

Digitized by Google

These old roses are among the easiest to grow. Almost invariably on their own roots, they are found to grow rather slowly; they strike readily from cuttings, however, but do not transplant too well, because the tough strong roots are almost fibreless.

The full flowers of these sorts are all sweetly scented and, in a well established bush, they are borne with astounding profusion. No rose garden of any pretensions can be considered complete without a few of these—the ancestors of many present-day kinds.

Readers should note that there are new varieties of the above. We have only a few of them, but all have their merit and we cannot dispense with one. The old sorts will never be ousted by their modernised friends, for no real gardener can overlook the charm of those roses which our forefathers loved.—CLYDESDALE.

CODONOPSIS NEPALENSIS.

GARDENERS may be classified into two main groups, those who care only for flowers in the mass and those who interest themselves in each individual flower. To this latter class, the museum gardeners or plant curio collectors, Codonopsis nepalensis will exert an irresistible attraction. They will feel compelled to add this new bell to those they already possess in their belfry, for codonopsis is a member of the campanula family. It is not at all a showy plant, being rather a pale, washed-out sort of a blue, but it is prettily veined and hangs very gracefully from a long, beautifully curved stalk. One looks down upon the outside of the bell, which is very broad and exquisitely shaped. But now carefully raise the bell and peep inside. In the centre is the clapper, pure white, divided into three and slightly hairy; it rises from a small pentagon of the darkest purple outlined with yellow excepting only at the five points where the white stamens are attached to the middle of the sides of the pentagon. When the flower first opens, these stamens are pressed closely against the pistil, and it is only later that they swing out and arrange themselves around the inside of the bell. This is very beautifully adorned with two parallel stencilled rings of claret colour. Truly a museum piece. The bud, calyx and leaves are of a soft downy appearance and greyish green. The buds at first resemble a Japanese lantern until they begin to open, when the pale blue flutings of the folded bell can be seen emerging like a moth from the chrysalis. It likes a place in partial shade in a warm corner.—EDWARD CAHEN.

ARTEMISIA CAMPHORATA.

THE wormwoods present us with a goodly number of useful plants, with silvery or greyish foliage. One very little known, yet particularly pleasing, and even more aromatic than the majority of the artemisias is A. camphorata. The aroma is hardly what we associate with the term "camphorata," but it is powerful and pleasing to most folks. This is a neat little shrub with silvery-grey foliage, deeply cut on a sub-shrubby plant, which, with the writer, never reached more than about 18ins. in height and was a long time in attaining even that. It appears to be perfectly hardy, as he had it growing on a most exposed rock garden where it received every wind which blew. In poor, hard soil it gave every satisfaction, although, as is the wont of most wormwoods, its flowers were of no account. A. camphorata is a native of the rocks of Castille.—S. ARNOTT.

GROW MORE IRISES

In this article the author, a well known authority, describes varieties of bearded irises for the average garden. These can be planted immediately.

THE improvement of the June-flowering bearded iris in recent years has been so pronounced and there has been of late such a rush of new introductions, that it may be worth while drawing attention to some medium priced varieties that are worth extended planting; though it must be borne in mind that there are many others of equal value.

To start off with a first-class iris in every respect, the French raised Souvenir de Mme. Gaudichau (I wish it had a shorter name), almost a deep purple self of fine shape and quality. This is a good all-round variety, and few can beat it. Then we have Lord of June, a lighter purple bicolor with enormous flowers, heavily scented; Ballerine, very large, a pale self mauve, also very fragrant; Lady Foster, perfectly proportioned of similar colouring, turning to deeper shades; Harmony, almost a dark purple self, smaller than the preceding being bred from Cengialti; if we add Goldcrest and Viola we have two varieties with neat-shaped self blooms and free flowering, with many spikes to a clump.

In red purple shades, Oporto is tall and well named, much liked by that great flower lover, the late Rev. J. Jacob. Edouard Michel, Caprice and Opera, are all of similar colouring, the last named being particularly good. Now let me think of some lighter shades of mixed colouring—blends, as they are sometimes called.

SOUVENIR DE MME. GAUDICHAU IS A FIRST-CLASS VARIETY.

Tall growing is Afterglow, a fine plant of clouded yellow and buff tone. Princess Victoria Louise has primrose yellow standards and purple falls, with lighter edge; perhaps old, but still very good. Quaker Lady, smaller flowers, but a quaint combination of quiet tones, which in Eldorado are more strongly defined, are also favourites. In strong colour contrasts we find Flaming Sword, a finer Iris King, though the latter is by no means to be despised, and Romany, a cheerful study in rich chestnut brown and pinky bronze. While of similar tones we have Prosper Laugier and Colonel Candelot, the latter, perhaps small, but fine in colour. Before we leave the dull shades we must not forget Ambassadeur, a magnificent study in bronze and brown, and Alcaza, not so good, but very free and tall. In mauve pink shades, Queen Elinor is very free and pretty with dark contrasting falls; Georgia, early, almost a self; Mrs. Alan Gray, old, but indispensable, possibly more widely grown than any other Shelford raised iris. Rosalind, pale pink, tall and very free, has more spikes to a clump than most.

In whites edged with blue, Ma Mie is good, as are also Fairy, Dimity (of later growth and more lined than edged) and Camelot. Princess Osra is possibly the best here, the marking being most distinct. This section is good for table decoration when their delightful markings can be seen and valued.

In yellow selfs we still have to rely on Aurea and

Mrs. Neubronner, though there are hosts of new yellows coming along, especially Shekinah, a grand yellow self of free habit. It will soon be coming down in price and is a plant for every garden. I find I have already named over thirty varieties. I could easily name as many more, but within the limits of a short note one must draw the line. It would be interesting to write of some of the latest novelties, and there are a number, but time and space forbid. R. W. W.

CORRESPONDENCE

SOME ODD IDEAS.

SIR,—As soon as the rose bushes begin to show their first tender leaves, an amateur grower of my acquaintance syringes them regularly with hot water; sufficiently hot for him just to bear his hand in it. He does this for a fortnight or three weeks, beds and bushes steaming copiously during the operation. He saw it first practised in a large garden in Fife, and does it himself every year, the theory being that it encourages growth, shortening the period of very tender foliage and discourages the green fly to the point of extinction. This is done, it must be remembered, in East Scotland, when a day of scorching sun is often followed by a nipping night of east wind bringing a clinging mantle of soaking mist. It seems a Spartan treatment, but is quite successful, for I was given a bunch of "out size" roses one day last year; whether they represented the survival of the fittest or not, I was not informed. I have been told that a gorse branch stuck into a rose bush is an effectual preventive of a caterpillar attack. I have no personal knowledge of this, but give it as a piece of garden belief or superstition, of which there is quite a floating capital. For instance, there is the "lucky hand," which I am credited with possessing. It means a combination of Paul's planting and Apollo's watering. What one plants is fairly certain to grow. I was told the other day of a man who can plant most things, but not alyssums of any kind. He has to get his wife to do that. If the annual alyssums are to be pricked out the lady must do it, or the whole consignment dies incontinently. There are a good many things "outwith" our philosophy.—E. M. J.

SWEET PEAS AND LIME TWIGS.

SIR,—Can you or any of your readers give me any reason why sweet peas will not take hold of lime tree twigs? I cut some of these early in the season, and although laid away to dry, when I commenced staking I found there was quite a lot of sap remaining in them. As a matter of fact, some of them are actually sprouting. The sweet pea plants absolutely refuse to catch hold. You may twist the plants round them, but they simply unwind and come right away. It would be really interesting to know if any of your readers have experienced anything similar. The only case in which they have attempted to cling is where the twig is actually dead.—WEALDSTONE.

MONOMARKS IN THE GARDEN.

SIR,—In the garden both the amateur and professional gardener are busy at this time of year. In the case of the former there is a perpetual interchange of tools and implements between neighbours. Sometimes implements so borrowed are not returned, and there thus begins a regrettable feud which mars the harmony of the neighbourhood. How easily this unpleasantness and friction could be avoided if a monomark were adopted and branded on every spade, fork, hoe, roller and mowing machine. If a certain person has B.M./S.T.U. as a monomark, then it is sure that a spade branded with that sign is his property, for there are no two monomarks alike. There could not be any argument about it and the local harmony would be undisturbed.

Firms which supply gardening accessories, seeds, etc., will also find that there are advantages in possessing a monomark with which to stamp their goods. In this case the prefix will be B.C.M. and not B.M. On garden tools unsuitable for inscribing the maker's name and address the monomark provides an adequate and efficient substitute, for it is name and address in one. A satisfied purchaser of a monomarked article who wishes to repeat the order has but to address his letter to the letters of the monomark, adding London, W.C.1, when the communication will be immediately forwarded and a reply should be received in two or three days.—JOHN FOSTER FRASER.

LILIUM SZOVITSIANUM.

SIR,—I think the enclosed photograph might interest your readers. It shows a plant of Lilium Szovitsianum growing in grass, where it has been undisturbed for the last five years. This year it is bearing sixteen

LILIUM SZOVITSIANUM GROWING IN GRASS.

flowers and is the best plant of this species in these gardens.—ANNIE BROOKER, *Aberuchill Gardens, Perthshire.*

THE POTATO DISEASE (PHYTOPHTHORA INFESTANS).

SIR,—News comes from Ireland that the dreaded potato disease has appeared in certain of the western counties. All growers should be on the look out for this trouble, especially in a season which promises to be cool and rainy. As is well known the potato disease is due to the attacks of a parasitic fungus known as Phytophthora infestans.

One feature of the potato disease is the suddenness of the attack. After a spell of damp weather there appear on the leaflets, or at times on the stalks, dark patches usually more or less rounded. These spread rapidly and eventually become black. As time goes on the patches become rotten towards the centre and finally the foliage may become riddled with holes. These diseased areas are but the outward sign of the actual fungus which is growing within the tissues of the plant. The whitish mould to be seen chiefly on the borders of the patches is simply the vegetative system of the fungus responsible for the development of the spores by means of which the fungus is propagated. These spores secure a wide distribution and the disease rapidly spreads to other plants.

Certain measures to prevent, or at any rate lessen the chances of potato crops being attacked by phytophthora may be taken. These include the securing of "seed" which is quite free from the disease and the selection of resistant varieties. Close planting is also likely to increase the risk of an attack as hardly any of the fungoid pests flourish where there is plenty of light and air. With standing crops these considerations do not arise, and the most important thing is to know what to do when the first signs of the disease are noticed. Everything depends on prompt action and, if this is taken, the trouble can be largely controlled. Without a doubt the most effective means of dealing with the potato disease is to spray the crop either with Burgundy or Bordeaux mixture. These solutions can be secured from firms who specialise in such things and it is not worth while preparing the mixtures for oneself. Follow the directions carefully and apply through a nozzle that will give a fine misty spray. If possible carry out the spraying during a dry spell in the early morning hours. The mixture will then stand a chance of drying on the leaves, where it will remain for some while even if rain follows. Two or three applications of either of the mixtures should be made during the growing season at suitable intervals. Even if there are not actual signs of phytophthora, spraying may be adopted as a preventive measure. There is a tendency among up-to-date potato growers to introduce spraying as a regular feature, and this is all to the good.—S. LEONARD BASTIN, *Bournemouth.*

ARUMS IN THE OPEN.

SIR,—With reference to the notes on growing arums in the open, I may mention that for several years we have grown the yellow arum (Richardia Elliottiana) in clumps in the border here, hardening off the plants and putting them out about the end of May. They do not flower as freely as one could desire, but they make very large corms, and exclamations of surprise from visitors lead me to suppose that it is unusual for the beautiful golden yellow spathes of this plant to be seen among other things in the outdoor garden.—F. HERBERT CHAPMAN, *Rye.*

AN IRIS STREET-BORDER.

SIR,—At Hartlepool, on the coast of Durham, the purple irises have made a wonderful show this year. Four years ago an untidy stretch of grass on one side of a street was enclosed by low wind shelters and thickly planted with irises. Over 100yds. long and varying from 2yds. to 5yds. wide, they have certainly been one of the attractions of this old seaport during May and June.—S. ROBSON.

DELPHINIUMS AT VINCENT SQUARE

THE visitor, entering the R.H.S. Hall on June 29th might well have imagined he was walking into a National Show of Delphiniums, with a few other flowers of different character brought in for the purpose of "setting" and giving emphasis to their massive and stately build and to their extraordinary range of shades.

The display on this occasion was outstanding in the history of an increasingly popular and magnificent flower. Mr. H. J. Jones, Lewisham, always a past-master in the art of staging, had a vast stretch of wall space against which he built up sheaves and baskets. Many of Mr. Jones's varieties were of Continental origin, and quite a good seedling of the exhibitor's own was named Mrs. Dykes, a beautiful Cambridge blue with a decided pink tinge in its centre.

Messrs. Bees, Limited, staged a group which fully justified the task of bringing a heavy load all the way from Sealands on the borders of Wales. The famous Watkin Samuel strain was to the fore. Jenny Jones and Purple Splendour, practically of the same style and colour—blue plum background with rosy magenta centre—were very conspicuous; and quite as good in totally different style was the almost self-coloured Hawarden Castle, the colour of which is a sound pink-mauve. Welsh Boy, Sunshine and Happy Thoughts were good things.

From these magnificent groups we pass to that of Messrs. Blackmore and Langdon, Bath, who, despite the steady increase in the number of specialists, still hold their own with the delphiniums as well as begonias. Mrs. Foster Cunliffe, Lady Edith, Phyllis and Howard H. Crane will please those who seek the pink as more novel than the blue in this family. but Blue Princess, Turquoise and Mrs. Paul Nelke, were sky blue.

Somewhat severe in erect regularity but full of wonderful quality and cultural skill were Messrs. Hewitt's, who also had a number of the Watkin Samuel tribe in their collection. Rose Marie is of richest plum and almost crimson-purple shades, Ruffled Beauty and Coquette were other pleasing varieties.

A smaller but still meritorious group was staged by Mr. T. Carlyle, Blue Queen, Coquette, Evelyn M. Cole and Fair Lady played a prominent part in the display, and Mrs. Thos. Carlyle, which has been frequently commended, was again well represented by closely built spikes.

Even in the exhibits which featured rock and border plants of general character, delphiniums were much used as backgrounds; but Messrs. Waterer, Sons and Crisp also made good use of their fine yellow lupin, "Sunshine," and another quaint bicolor variety named Chocolate Soldier. Campanula Bilardii Miranda, with nodding white bells, the lavender mauve Viola Lady Crisp and Genista dalmatica were among the miniature treasures of this group.

Messrs. Tucker showed Hypericum orientale, which carries its butter yellow flowers on erect stems, and Campanula excisa, a rarity whose pale blue flowers are curiously pierced.

Messrs. Maxwell and Beale showed the flaming scarlet Verbena chamædryoides, which is very reasonably hardy seeing that it comes from so near the equator; Viola bosniaca, the pinkest of the wild pansies, and the strange, dark, dusty crimson of Erica cinerea coccinea against the white form of a type.

Messrs. B. Ladhams, Limited, Southampton, always show something of uncommon interest, and Hemerocallis B. Ladhams, a flower of good size and clear golden colour; the old Glaucium flavum tricolor, and Campanula latifolia alba, were among the plants noted.

In the far corner of the Hall, Messrs. Maurice Prichard and Sons had a very charming group of choice perennials. Iris Kæmpferi were in fine form, but the plant which compelled lingering gaze was Poterium tenuifolium album. Here is a plant with the grace of the reeds and grasses, the freedom of the knotweeds and the uncommon appearance of the catkin-bearing hazels.

Chalk Hill Nurseries, Limited, Reading. made a cheery display of their double-flowered Shirley poppies. Both in colour and form this strain is a great stride forward upon the original double Shirleys and for cutting they are far superior to the singles.

Mr. W. Wells, Junr., had a number of interesting subjects on his stand, but the new double Gypsophila Bristol Fairy rather overwhelmed its companions and commandeered the limelight. It is a good enough plant to stand on its own and will be a plant for every garden.

Messrs. Barr and Sons provided a distinct break away by concentrating on English irises, which were extremely well grown and attractively staged. Almonea, Cattleya, Blue Giant and Mont Blanc were a few really good and distinct varieties and as one turned from the irises, a pleasing note was struck by the uncommon ruby-flowered Watsonia angustifolia, and a few spikes of choice eremuri, the amber yellow of E. Bungeii being pleasant.

The end of June is very late for rhododendrons and it is not surprising that an exhibit of single trusses, embracing a range of pink and red shades, all in first-class form, attracted the general visitor as well as the experts. The exhibitor was Mr. C. Slocock, Woking, and the flowers represent a new race of discolor hybrids which will have a wide field of utility.

Messrs. Paul of Waltham Cross and the Rev. J. H. Pemberton, Havering Atte Bower, were exhibitors of roses. Lady Inchiquin, Lady Roundhay and Courage were bright colours on Messrs. Paul's stand, but Mrs. Tresham Gilbey was of a colour which seemed to have blended into one shade the best tints of the apricot and the flush of the peach. The other exhibit was ablaze with a mass of Padre, The Adjutant and Ruth, the last named being richer and brighter than Independence Day.

The Allwood exhibit was, on this occasion, somewhat different from the usual, for border carnations were a prominent feature. The Bookham selfs were very fine, the Salmon, Rose, White and Crimson being of pure clean colour as well as shapely form.

Another cooling exhibit was the oblong water pool in which Mr. Amos Perry displayed a choice selection of nymphæas, a very narrow petalled white named Temple Sur Lot and another sharply pointed flower of rich carmine named Attraction; the familiar, but very fine James Brydon and the delicate Sulphuretta were a few distinctive gems in the collection. Along the margins and at the ends moisture-loving ferns, hemerocallis, liliums and armerias were tastefully grouped.

MESSRS. PERRY'S EXHIBIT OF WATER-LOVING PLANTS.

NEW & RARE PLANTS.

AWARDS OF MERIT.

HYDRANGEA MRS. H. J. JONES.—A fine novelty of French origin. The habit of the plant is compact and vigorous and the large flower trusses are deep pink in colour. Shown by Mr. H. J. Jones, Ryecroft Nurseries, Lewisham.

ARCTOTIS BREVISCAPA.—An attractive half-hardy Cape plant. The vivid orange daisy-like flowers, with their dark centres, are about 2ins. in width, and are borne on stems of 8-10ins. in height. A fine plant for a sunny bank. Shown by Mr. T. Hay, Hyde Park.

DELPHINIUM LADY EDITH.—A semi-double variety with massive spikes of soft mauve and blue flowers with black centres. The habit of the variety is free and the colour good. Shown by Messrs. Blackmore and Langdon, Bath.

PONTEDERIA CRASSIPES (VAR. LANCEOLATA).—An interesting and handsome water-loving plant which bears lance-shaped leaves in tufts on stems of about 4ft. in height. The small soft lilac flowers are borne in loose spikes of 3ins. in length. Shown by Mr. Amos Perry, Enfield.

ONONIS FRUTICOSA.—A compact, low-growing leguminous shrubby plant of about 1ft. high. The flowers, with rose coloured standards and wings of palest pink, are borne in great profusion. Shown by University Botanic Gardens, Cambridge.

WALLFLOWERS.—Benary's strain of annual double. A new strain of wallflowers obtained by crossing single blooming annual wallflowers with double flowering biennial varieties. Shown by Mr. E. Benary, Erfurt.

RHODODENDRON DIAPREPES.—Large white flowers are borne in loose trusses. A valuable late-flowering species Shown by Mr. Lionel de Rothschild, Exbury, Hampshire.

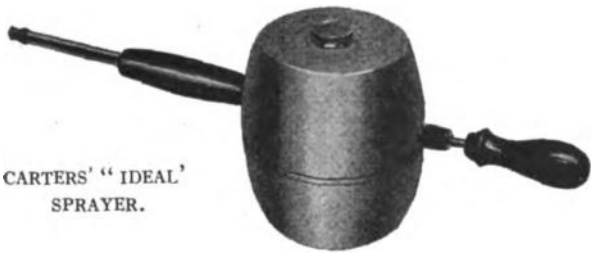
UP-TO-DATE SPRAYING MACHINES

ONE of the most noticeable features at recent important shows has been the large amount of space devoted to the exhibition of modern spraying apparatus. If spraying is to be effective it must be thoroughly carried out, and reliable apparatus is therefore a necessity.

Perhaps the three most important qualifications to be looked for when selecting a suitable machine are: (1) a machine soundly constructed of acid-proof metal, and yet convenient to handle and simple to operate; (2) a sufficiency of power to ensure a forceful delivery of a misty spray and uniformity in spread; (3) filling arrangements must be convenient, and a type of nozzle must be fitted which will reduce choking and stoppages to a minimum. There are a large number of machines made to-day for dealing successfully with all classes of work, from the smallest garden or greenhouse to the largest orchard and plantation, and most of these machines will conform to the above specifications.

A machine of comparatively recent introduction which will be found very convenient for general use in a small establishment is Carters' "Ideal." It is made in 2-pint and 3-pint sizes and is in the form of a small hand syringe which passes through a copper container tank. Three types of spray can be obtained: a cloudy, mist-like spray, a long mist spray carrying to a height of 25ft., or a long, thin, forceful jet covering a distance of 30ft. The regulation is extremely simple, the longer sprays being obtained by the removal of a small nut from the nozzle; while the strength of the actual delivery is governed by the force used in pumping. The "Ideal" sprayer is also supplied in knapsack form, of 2½ gallon capacity. There are many types of small pneumatic machines on the market, such as the "Martsmith," "Vermorel," "Streetley," "Con-o Mist," etc., any of which will be found extremely serviceable in either small or large establishments. Most of these are self-contained units which can be obtained in various sizes. The spray is governed by compressed air, which is pumped into the cylinder before use, and it can usually be turned on or off at will by simply pressing a small valve lever. As no pumping is necessary when actually spraying, the obvious advantage of having both hands free to direct the spray will readily be seen. The majority of these machines are reasonable in initial cost and most of the small sizes can be easily manipulated by a lady.



CARTERS' "IDEAL" SPRAYER.

Another modern machine which will commend itself to many is the "Eclipse," which is adaptable to practically any and every class of spraying work. The sprayer itself is fitted with a hose connection with a valve and strainer combined. The valve is simply placed into a bucket or other container of the spray fluid, the plunger rod is drawn in and out until spraying commences, and no further pumping is required until all the liquid is exhausted, both hands therefore being free to direct the spray. Each machine is supplied with 10ft. of hose, but the manufacturers claim that successful operations can be carried out with hose up to 200ft. long.

Another very useful model which has recently been put on the market is known as the Stonehouse "Teleco" Syringe. As its name implies this syringe can be extended by means of telescopic joints up to 4ft. in length, so that anyone of average height can readily spray foliage, etc., at a height of 10ft., without having recourse to extra lances or ladders. It is fitted with hose pipe and suction valve, and is worked in the same way as an ordinary garden syringe. Its total weight is only 3½lbs.

The "Weeford Pattern" is a pneumatic knapsack sprayer of an entirely new type which has many good points to commend it. It has a capacity of 4 gallons, and weighs only 19lb. It fills from the bottom, and the liquid is pumped in through a hose. It is fitted with a special gauge which indicates when the necessary pressure is reached. It only requires to be charged with air once a day, and an even pressure is maintained until all liquid is discharged. This machine, in common with most others manufactured by the Four Oaks Company, can be obtained fitted with a special unchokable nozzle. The special feature about the unchokable nozzle is that it is manufactured with a spring which comes into operation if there should be any stoppage and at once clears any obstruction in the orifice of the nozzle. It is especially recommended for use with very thick or gritty washes.

The Martsmith Company are responsible for a very excellent 10-gallon pneumatic machine, known as the "Martsmith" Wheeling Type Sprayer. The container is fitted on an iron frame with handles and a single wheel in front, on the same lines as an ordinary gardener's barrow. It is especially convenient for use along narrow paths in large greenhouses or between growing rows of bush fruit. All the pumping is done before spraying commences, and once the machine is wheeled into position both hands are free for working. It is supplied with a 5ft. brass lance and is eminently suitable for work on tall bushes and trees.

Most of the machines I have mentioned are free from intricate attachments and devices, and the very necessary operation of careful cleansing after use is thus reduced to a task of a simple nature. It is a task, however, which should never be omitted, especially after any caustic washes or strong acids have been used.

FLOWERS IN GARDEN AND GREENHOUSE

CINERARIAS.

Off-Shoots versus Seedlings.

THE number of gardeners who propagate cinerarias from off-shoots secured from old plants to-day, is negligible and for this once popular method one has to go back to the early days of the Victorian era to find it in force. It was the general practice at that period to take the off-shoots, or cuttings from specially good sorts, pot them separately in small pots of sandy soil, and plunge them in slight bottom heat to aid rooting. In those days, varieties of repute were known by name, and the plan adopted in perpetuating them was considered the most reliable and the only one to ensure the strain of any particular sort being kept. The raising of cinerarias from seed was not unknown, but it was not generally adopted until a later period, because seed could not be quite depended upon. In a word, "like did not produce like." Seed was not "fixed" as we understand it to-day. But growers of cinerarias in earlier years had their difficulties with shoot-raised plants, mainly because these lacked stamina, which caused them to die off prematurely, and not infrequently were peculiarly liable to attacks of green fly. Only during the early part of this year, I saw a batch of cinerarias raised in the manner described, but the grower did not appear to be quite satisfied with them and admitted that although the sowing of seed and subsequent pricking out of seedlings entailed more labour, results were better, as they possessed more vitality and from the first were immune from disease, which was not always so in the case of off-shoots. Coolness in the culture of cinerarias is vital and if they are bloomed in a house with very little heat, they are not the troublesome plants some believe them to be. One thing is quite certain, that so far as superb varieties of cinerarias go, no one has any need to resort to any other way of raising plants, than from seed, as to-day we possess a wealth in varieties and colours, for which, in a great measure, we are indebted to the very painstaking work of the early hybridisers.—CLAREMONT.

PELARGONIUMS AFTER FLOWERING.

REGAL and show pelargoniums make the greenhouse or conservatory very gay during the late spring months. The plants remain in excellent condition for a number of years if they are carefully treated. When in active growth and nearing the flowering stage the foliage must be kept free from aphides. After the flowering period the plants should be vigorously syringed with clear water and placed outside on a bed of ashes. Water should be gradually withheld from the soil and after this natural drying off, which takes about six weeks, the time has come to prune the shoots, cutting back the branches almost as severely as one would a hybrid perpetual rose bush. The necessary cuttings

Digitized by Google

are taken at an earlier stage. After the pruning is finished the pots should be placed on their sides for several weeks. In August the plants should be placed in a cold frame, be watered once then syringed twice daily until the new shoots are 1in. long. If the frame is kept closed the new shoots soon grow. Repot, reducing the old ball of soil; use smaller pots to allow of potting on and admit air freely to the frame. Turfy loam, two-thirds; leaf-soil, one-third. To each bushel add a 5in. potful of bonemeal. This compost will answer for subsequent repottings.—HANTS.

LIFTING AND STORING BULBS FROM BORDERS.

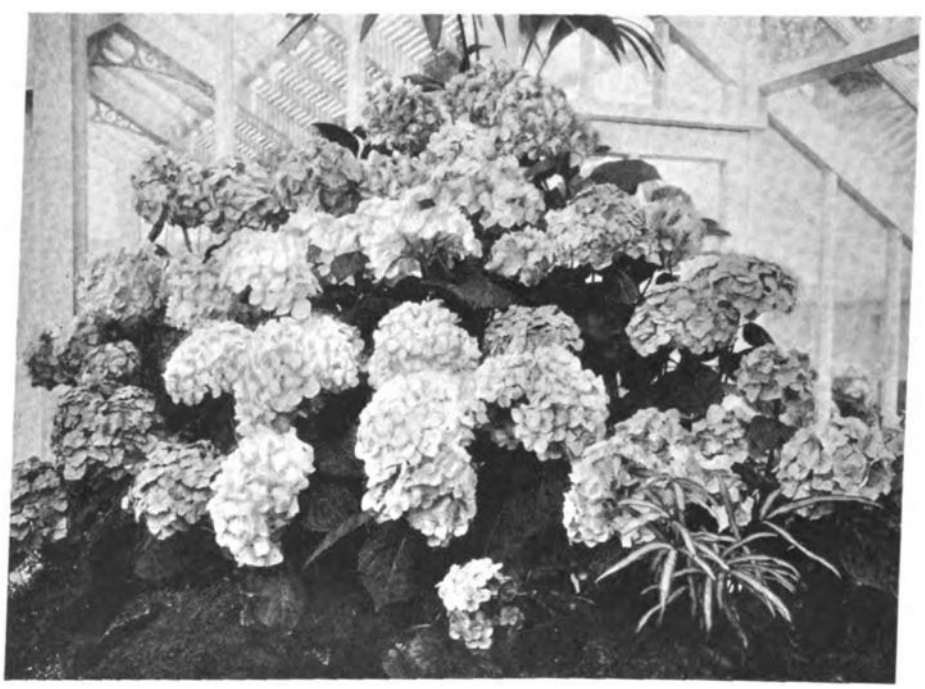
WHERE it is convenient to leave bulbs in the soil until they have matured their foliage naturally, the cultivator gains a great deal. He will possess sound bulbs which will grow again very freely when the time comes to replant them.

Although the leaves are brown and ripe, most of the stalks of such still adhere to the bulbs so there must not be any forcible pulling away of the dried-up leaves and stems. Lift all carefully without separating the leaf-stalks from the bulbs except those that may be quite ripe and fall away naturally directly they are disturbed. Have a few shallow boxes near the bed, also some new labels to replace any that are damaged. In this way the correct names will be preserved and this will prove most helpful when the time comes for re-planting. Take out the roots as well as the bulbs without breaking off more than can be helped and lay all carefully in the shallow boxes. Place the latter in a dry, cool shed, preferably one open at the front and facing north or north-east. Some cultivators lay the bulbs in a dry border to finish ripening; this is bad for them as they generally start growth in such positions prematurely. Then, when they are disturbed for the replanting a check is given. When the bulbs are dried sufficiently without being shrivelled, and all the leaf-stalks readily drop away, store them in a dry, cool cupboard or room in readiness for the re-planting.—G. G.

THE HYDRANGEA.

How to Obtain the Best Results.

THE hydrangea to-day can claim a prominent place in horticulture, both for its beauty, the length of time the blooms last and also for ease of cultivation. As we have looked during the past few years at the massive blooms with their exquisite colourings which have been staged at the Chelsea Show, we have been filled with admiration and our thoughts have gone back to the once prevailing colour, or should we say mixture, of pink and white and in many cases no more than a dirty white of the old hybrangeas of a few years ago. One can but realise the strides that have been made in bringing about the present charming variety of colour. The cultivation of the hydrangea is not a very difficult thing and a good selection can be made from the varieties listed in the catalogues of firms who specialise in these flowers. Young plants can be procured during June and July in 3in. pots and these should be grown in a frame, keeping them fairly close. Water with care and syringe them on bright days giving the plants a light shading from the direct rays of the sun. When the plants are well rooted, repot them into 5in. pots, using a compost of one part peat, two parts leaf soil, one part of good loam and a good sprinkling of coarse sand. It is not advisable to ram the soil in the pots too hard, but pressing the compost with the fingers will be found quite sufficient. The plants should be returned to the frame again and treated as previously until they are seen to be rooting into the new potting medium, when they should be taken from the frame and stood in the open air on a bed of ashes in full sunlight to ensure the thorough ripening of the wood. This is a most important factor in obtaining good flower buds. Where the pots are seen to be getting full of roots, the plants should be given a good feeding with diluted cow manure water, once or twice a week on an average, until, from the first week to the middle of October, when they should be removed to a cool house. The plants should be kept on the dry side during the winter months. About February a batch of plants should be introduced to a warmer house and when growth is active again, more water will be required. As the plants come into flower a shading from the sun will preserve their colour and prolong the flowering period. Rooted cuttings if well grown will produce one fine bloom in about two months. When the bloom is fading it should be cut off and the plant will then throw out other shoots which will make a nice bushy plant the next season. Undoubtedly the blue hydrangea is the most attractive and many are anxious to know how to obtain this pleasing shade. In some cases this is obtained naturally by the large quantity of iron in the soil in which they are grown. In other cases very good results are obtained by watering the plants with a concoction of 1 oz. alum to each gallon of water. However, the surest and safest plan is to procure the special blueing powder now on sale by any reliable firm and treat the plants according to the directions given with the powder. By this method individual plants can be treated, which will be most susceptible to the treatment described and consequently the best results obtained.—P. E. C.



HYDRANGEAS ARE EXCELLENT POT PLANTS FOR THE COOL GREENHOUSE.

VERBENAS.

Old Florists' Methods versus Modern Culture.

CONSIDERING their all-round capabilities, it is not easy to understand why verbenas are not as popular as they were years ago in the time of the old florists, who, recognising their worth, used them for bedding, for culture in pots and for window boxes and baskets. When we sow a packet of seed in the warmth of the greenhouse in February or March we cherish no suspicion of failure to germinate, because we have become accustomed to raising plants in this way. We cannot realise that there was once a time when our predecessors prepared their plants in a different manner. Layering shoots from bedded out plants was a favourite method of keeping a stock and it was carried out much in the same way as we do in regard to strawberry runners to-day and usually took place late in August or early September. The plan was to choose promising shoots and peg them down in pots of sandy soil, near a joint, making a slight incision under the joint, and when rooted, sever from the parent plant and place the pots in a cold frame. It was almost useless to attempt to take up old plants after they had been in the open ground, as they did not shift well and invariably died off. Propagation from cuttings was also a favourite method of perpetuating verbenas and these cuttings were procured as early as possible at the end of the summer and rooted in a frame. Such plants formed stock for further cuttings to be propagated in heat in spring. Winter treatment consisted in keeping the young plants on a shelf near the glass, either in a pit, or greenhouse slightly heated to ward off frost and damp. The latter was an enemy which the florists had to contend with, and not infrequently, in January, losses would be experienced unless great care was exercised in not exciting plants with over-much heat, in keeping the surface of the soil stirred, and so banishing damp. Silver sand, old loam and charcoal, together with a little leaf mould used to be a favourite compost. In taking cuttings, special emphasis was laid on preventing the leaves from flagging and this is why they were inserted in pots or pans in which plenty of sand predominated, and were kept quite near to the glass until roots had formed. While the cuttings were fresh, they had a greater chance of rooting, but if once allowed to flag, or the compost became dry, failure invariably followed.

We, in these days, have no occasion to go to all this trouble as, like any other half hardy annual, one may get a collection of splendid varieties from a mixed packet of seed, which, if sown in slight heat in spring, will produce plants that will grace the garden in July and until early autumn.—W. F.

WHITE FOXGLOVES.

AT the time of writing, one of the prettiest bits in my garden is a section of an irregular-shaped border where white foxgloves are in full bloom. They are not, perhaps, quite so tall as in some previous years, but it seems to me that their white is purer than usual, and, combined with delphiniums in many shades of blue, backed by the glorious scarlet crimson of Rosa Moyesii, with groups of mixed Spanish irises in front, they are very good to look upon. The foxgloves seed themselves freely, but care is taken that the seed is properly dispersed by shaking some of the ripened pods over the special area in which they are wanted to grow. Seedlings will transplant, but they make finer plants if not moved, and seem less liable to be exterminated by slugs. Besides their allotted place in the border, the foxgloves this year have appeared in others distinctly less suitable, but with happy results. A group is in full flower against a wall at the back of a little rock garden—the last situation which one would have chosen for them; but the effect of the towering snowy spikes rising above the glowing sheets of Oxalis rosea, Geranium grandiflorum, Veronica repens and many-coloured helianthemums is quite beautiful.

I may add that, to keep the strain pure, it is essential to pull up every plant of the digitalis that shows the slightest streak or spot of crimson in its white bells, else the seedlings will gradually revert to the wild type.—R. E. H.

MORE ABOUT THE SUMMER ROSE SHOW

EXHIBITION ROSES.

The long rows of specimen exhibitiion roses in show boxes made a good general effect and attracted large numbers of visitors, but on close inspection it was seen that the general quality was not equal to the average of former years. Too many of the blooms were of the "butterfly" nature. The exhibitors must have experienced considerable difficulty in selecting their show blooms. Timing the blooms so that each shall be as near perfection as possible when the judges make their inspection is always a very troublesome matter and requires considerable knowledge of the vagaries of the different varieties. Added to this the exhibits have this year had to contend with the effects of the great heat of the few days prior to the Show which caused the blooms to develop too quickly so that many, especially those grown on light soils, lacked substance, and although they were perfect in the bud state become "open-eyed" when mature. But although such blooms were present, they were in the minority. Occasionally in the stands a bloom which, when gathered, promised to be the best bloom of its class was found on development to have a double centre.

The Championship for Exhibition Roses, which carries with it the China Trophy, silver-gilt medal and money prize, was won by Messrs. F. Cant and Co. with an even and very fresh collection of forty-eight distinct varieties, as Admiration, Bessie Chaplin, Dean Hole, Mrs. Henry Balfour, Mrs. J. Laing, Mrs. Amy Hammond, Mrs. Henry Bowles, Courage, Lord Allenby and Frau Karl Druschki. Messrs. D. Prior and Son, who were a good second in this premier class for exhibition roses, staged very good specimens of Lady Inchiquin, Coronation, Ruth, Bessie Chaplin and Lord Allenby. Messrs. George Longley and Sons were third.

The John Hart Memorial Cup, offered for twenty-four distinct varieties, was won by Mr. Elisha J. Hicks with a well balanced collection. His chief varieties were Earl Haig, Fragrance, Molly Sharman Crawford, Arthur Cook and J. N. Hart. Mr. W. Slinger included in his second prize collection Gorgeous, Courtney Page, Mrs. C. Lamplough and Lemon Pillar of very good quality.

The tea roses were of good size generally, but the exhibits were a trifle uneven and included a few weather-stained blooms. Messrs. George Longley and Sons won the D'Ombrain Cup with a collection which included good specimens of Lady Plymouth, Medea, Mrs. Foley Hobbs and Molly Sharman Crawford. Mr. Henry Drew was a close second in this class, and his best blooms were Auguste Comte, Mrs. Foley Hobbs, Mrs. H. Stevens and Mme. L. Costantine.

The exhibits of twelve blooms of new roses distributed since January 1st, 1922, were of better quality and the competition also was keener. Mr. George Prince won the challenge cup with an admirable collection which included shapely blooms of William Kordes, Mabel Turner, Lord Charlewood, F. J. Harrison and Mabel Morse. In his second prize collection Mr. H. Mattock had very good blooms of Maud Cumming, Lord Allenby, Mabel Morse, Admiration and Betty Hulton.

The class for twelve blooms of any one variety distributed since January 1st, 1922, was also well above the average of previous years, and here the first prize was won by Messrs. F. Cant and Co. with a dozen excellent specimens of the rich crimson variety Courage. Mr. Elisha J. Hicks won the second prize with blooms of Lady Inchiquin of glowing colour.

A PRIZE-WINNING BASKET OF MME. BUTTERFLY.

NURSERYMEN S CLASSES.

The large representative groups of roses which were again shown on separate tables along the centre of the large tent, made a gorgeous spectacle, and, although there was a similarity in the method of arrangement in the chief prize-winning groups, the variations of some of the others successfully prevented any monotony.

The Championship Trophy was won by Messrs. Alex. Dickson and Sons with a superb group. They had perfect pillars of Betty Uprichard, Irish Elegance and K. of K. with a generous centre of Barbara Robinson surrounded by massed stands of François Juranville, Mrs. Henry Morse, Sunstar, Maud Cumming and other valuable roses. The finish of this champion group was equal to the high quality of the blooms. The second prize group of Mr. Elisha J. Hicks had corner pillars of Mabel Morse, Mrs. H. Stevens, Clovelly and Betty Uprichard, with rather shorter pillars of Mrs. E. Shea, Lady Inchiquin, Mrs. Elisha Hicks and other lovely varieties. Messrs. B. R. Cant and Co., the third prize winners, had a very graceful arrangement of baskets on stands at the corners of their group, and also included many good blooms. Messrs. H. Harkness and Co. also departed from the general style of arrangement in having pretty hanging baskets at the corners.

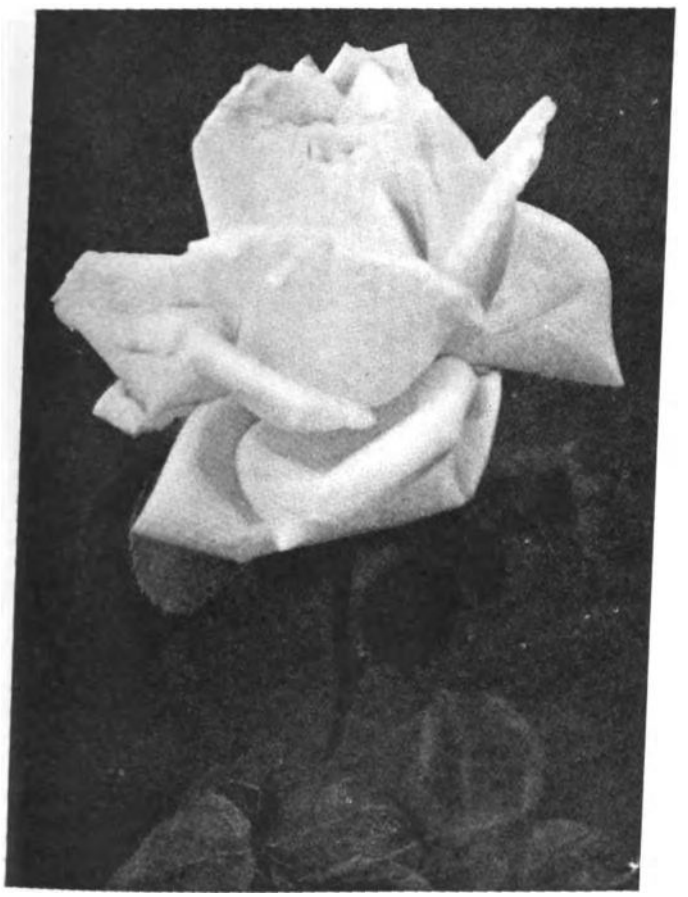
Although there were fewer competitors in the second group class, which provides a table 6ft. square, the half-dozen competitors had very attractive displays. The de Eschofet Cup was won by Mr. J. Mattock, who had fine pillars of Mrs. Tresham Gilbey, Mrs. Oakley Fisher, Mabel Morse and Betty Uprichard. In this first prize group there were good stands of Red Letter Day and Golden Emblem. A more graceful method was adopted by Mr. George Prince, the second prize winner, who had linked pillars at the corners. His centre of Paul's Scarlet Climber, surrounded by Betty Uprichard, Silver Moon, Etoile de Hollande and similar sorts in quantity, was very effective. The third prize was won by Messrs. T. English and Son, who had pillars of Mrs. Henry Bowles, Columbia and Independence

Digitized by Google

Day, rising above other good varieties. In this class Messrs. Morse Brothers and Mr. Walter Easlea had pretty groups.

The A. C. Turner Cup Competition is always popular with visitors, as it enables them to see vases of twenty-four very decorative roses set out separately. The cup was won by Messrs. A. Warner and Son, who had beautiful vases of Red Star, Mrs. H. Stevens, Covent Garden, Lady Hillingdon and similar good garden roses. The Lane's shown by Mr. George Birch; and Messrs. D. Prior and Son were second with very good blooms of Snow Queen. The lovely Louise Criner, shown by Mr. H. Mattock, was the best basket of H.T. varieties; and Nellie Parker, shown by Messrs. Jarman and Co., was the second best. Showing a fine basket of Mme. Jules Gravereaux, Messrs. D. Prior and Son were awarded the first prize for a basket of any tea or noisette rose. The Brayfort Challenge Cup, offered for a basket by the large dark shining foliage. The flowers have a slight fragrance. It is a variety which ought to prove popular with all rose lovers. Certificate of merit. Shown by Messrs. G. Beckwith and Sons.

A LINCOLN SEEDLING (UNNAMED).—The flowers of this free and vigorous hybrid tea semi-double variety were of a most brilliant and striking colour, a shade of scarlet tinged with orange and gold at the base of the petals. The petals were of good substance, and the



THE IVORY WHITE EVEREST.

THE DEEP VELVETY CRIMSON BLOOMS OF LADY HELEN MAGLONA

Nurseries Company were second, and they included lovely vases of K. of K., Mrs. A. Tate, Lady Roundhay and Golden Emblem.

Although the baskets of roses were not quite so numerous as usual, the quality was fully equal to that of former years. There were only two exhibits of seven baskets of decorative varieties. The first prize was won by Mr. H. Mattock, with gorgeous baskets of Mrs. H. Morse, Louise Criner, Benedict, Sequin, Mrs. A. Bowles, Mabel Morse. Messrs. Chaplin Brothers, who were second, included Betty Uprichard, Mrs. H. Morse and Mrs. Tresham Gilbey. The three baskets of similar roses were also of high quality, and Messrs. A. Warner and Son were decidedly first with splendid blooms of Hortulanus Budde, Lady Roundhay and the fragrant white Marcia Stanhope. Mr. Henry Drew included in his second prize exhibit Mrs. H. Morse and Mrs. H. Bowles. In the class for three baskets of polyantha varieties, Messrs. Morse Brothers won chief honours with profusely flowered sprays of Alice Morse, Rodhatte and Ellen Poulsen. Messrs. D. Prior and Son showed Else Poulsen in good form in their second prize baskets.

The exhibition roses in baskets were set out on the opposite side of the tent. The best basket of any one H.P. variety was splendid flowers of Candeur Lyonnaise, of fourteen blooms of any variety of H.P., H.T., tea or noisette rose put into commerce since January 1st, 1920, was won by Mr. "Sandy" Dickson, with gorgeous blooms; while Messrs. Chaplin Brothers were second with Mabel Morse.

NEW ROSES.

AWARDS OF MERIT.

LADY HELEN MAGLONA.—A vigorous hybrid tea variety suitable for either garden or exhibition purposes. It is very decorative and exceedingly free-flowering. In colour the flowers are a rich, deep, velvety crimson, and are medium in size and of good shape, showing a long pointed bud with small neat overlapping petals. Gold medal. Shown by Messrs. A. Dickson and Sons. It was requested that this rose should again be shown at the Autumn Show, for competition for the Clay Challenge Cup.

BILLY BOY.—An excellent semi-double hybrid tea of bushy growth. It is also a perpetual flowerer. The blooms are of good shape and form, both in bud (which is long-pointed) and when full open. The open flower is especially attractive with its clustered petals and its inner crown of stamens with red filaments. The colour is a good rich canary yellow, which is shown off to advantage foliage, also good, considerably enhanced the appearance of the blooms, which are fragrant. As a good all-round garden rose it should attract many admirers, as it should provide the most decorative effects when massed in a bed. Certificate of merit. Raised by M. Pernet Ducher and shown by Messrs. George Beckwith.

BEDFORD CRIMSON.—A very fine, vigorous and free-flowering hybrid tea variety, carrying deep velvety crimson blooms which are very fragrant. The foliage is of a rich green, and attractive. Certificate of merit. Shown by Messrs. Laxton Brothers.

EVEREST.—A very fine exhibition variety, carrying large snow white blooms with an ivory sheen. They keep a good shape, even when fully expanded, and are slightly perfumed. The blooms are well poised on the stems, and the pure beauty of the flowers is shown up well by the dark foliage. Certificate of merit. Shown by Messrs. W. Easlea and Sons.

PRINCESS ELIZABETH OF GREECE.—This fine hybrid tea variety is of an uncommon colour, and probably on that account received an award, as the blooms themselves were not particularly shapely. The colour is a shade of red orange which is particularly bright and attractive. The foliage is also decorative. Certificate of merit. Shown by Messrs. Chaplin Brothers.

GARDEN TECHNIQUE

FRUIT AND VEGETABLES

THE SUMMER PRUNING OF APPLES AND PEARS.

A Most Important Operation for the Fruit Grower.

MANY different ideas regarding the method of pruning to give the best results have been tested; but the best system, with bush and trained trees, is undoubtedly the spur-pruning system coupled with summer pruning. Of course there are exceptions to every rule, and Irish Peach stands out as a good example of an apple which is not amenable to spur pruning. However, this point can be discussed more fully in the winter.

At present we are concerned with summer pruning only. Of course, only those trees which have been spur pruned in winter will be systematically summer pruned. The time to perform this operation varies from year to year, but it is usually done in July or early August. The point to bear in mind is that, if done too early, the pruned shoots will recommence growth. This, of course, we want to avoid, and one must watch the trees and commence the pruning as soon as growth appears to have stopped. Naturally, it is undesirable to delay the operation longer than is absolutely necessary, as some of the benefits of the pruning will be lost and, owing to the rush of the fruit-picking season, the job will often have to be left..

Now for the objects of summer pruning. In the first place, the most obvious benefit is in allowing more light and air to reach the fruit resulting in better colour and more thorough ripening of the wood. Another very important object is that it checks the laterals and diverts more sap to the leaders, making these stronger and, at the same time, tends to plump up the remaining buds on the shortened lateral, thus encouraging the formation of fruit buds.

This last statement is, I know, a debatable one, as it is sometimes said that fruit buds form much earlier in the year, and summer pruning cannot have much effect. Even if this is so, surely the extra supply of sap will help the formation of the embryo flowers. However, I cannot altogether agree with the theory that all fruit buds are formed earlier than July. That many are formed in May and June I grant, but I fail to see how this theory accounts for flowers appearing on the upper half of last year's growth.

First of all, which shoots are to be pruned? Leaders must always be left full length, and any shoots which may possibly be required as temporary leaders should be left. All the others may be shortened to about six leaves. Taking the shoots back to three leaves has been tried, but it usually results in secondary growth. I notice that some gardeners still break the shoots and leave them hanging—to my mind, a bad practice, as it partly defeats the object of summer pruning, *i.e.*, the admission of plenty of light.

In most places cordon trees are summer pruned, but bushes are often neglected in this respect, which I consider a great pity, as summer pruning does help to produce more and better fruit.—P.

MUSHROOM BEDS FOR AUTUMN CROPS.

THE present is a very good time for making all necessary preparations for growing autumn crops of mushrooms. The following is a useful guide for any amateur cultivator to follow who wishes to have mushrooms available, approximately, on a given date. It takes about three weeks to collect the horse manure, prepare it for making up into beds and to become fit for receiving the lumps of spawn. From the date of spawning to that of the growth of the first mushrooms, about six weeks. A good bed, well managed, will yield mushrooms remuneratively for two months, and sparsely for a further three weeks. Ideal conditions under which mushrooms are grown are the following. A cool, dry, dark shed facing north, or nearly so; a moist atmosphere during the whole time, an even temperature and absence of cold draughts. During the winter mushrooms may be grown in beds under greenhouse stages; they may be sown in early autumn, but the mushrooms would be spoiled, most likely, by maggots then. So the cool shed is the best place to prepare now for the autumn supply.

Horse manure is the best material to use, either alone or with tree leaves. If it is used alone, do not take out all the short straw; if used with tree leaves, remove the straw. Spread out the manure daily, as collected, in a cool, dry shed. Add to it every day and turn the material over at the same time. When sufficient has been collected heap it for one night, the next day open out the material and so get rid of the rank gases. A bed 8ft. long, 4ft. wide and 16ins. deep when well firmed, is a suitable size for a single bed. The spawn should be inserted when the temperature of the bed is approximately 85 degrees on the downward grade. Then put on 1in. of good, fresh loam, make it very firm and cover the bed with a thick layer of clean, dry straw.—G. G.

RAISING LATE CROPS OF DWARF BEANS AND PEAS.

EARLY French beans and early peas are always much appreciated; there is rarely any stringiness in the former nor hard seeds in the latter. In the case of late crops, when the right varieties are grown, similar good qualities obtain. It would not answer our purpose if we sowed a late pea, such as Ne Plus Ultra, for instance. An early variety should be sown, such as Earliest of All, American Wonder, Chelsea Gem, Little Marvel, Hundredfold and, for a reliable dwarf marrowfat, Laxton's Progress. Of dwarf French or kidney beans, Earliest of All, Selected Canadian Wonder and Feltham Prolific may be grown. The soil for the French beans should be rather rich, and for the peas of medium richness. An old, mellow garden soil will not require the addition of much animal manure; but a poor stony soil will, as in the case of peas it is necessary to get haulm first by enriching the poor soil and then filling the pods by feeding with superphosphate of lime at the rate of 2 oz. per yard run of row, keeping the stimulant from touching the stems and leaves. Sow the seeds at least 4ins. apart in a flat-bottomed shallow trench. Stick early and keep the sticks well apart at the top to allow sun and air to ripen and well fill the pods.

Sow the bean seeds 9ins. apart in single lines 18ins. asunder, and mulch the rich soil with rotted manure when the first flowers form. Soon after this stage a weak application of nitrate of soda—1 oz. to 3 gallons of water—will not only hasten the growth of the pods but render them more tender and better flavoured.—CHRISTCHURCH.

PESTS OF BRASSICAS.

FROM the seedling to the maturing stage nearly all plants of the brassica family are subjected to attacks by pests that soon destroy the crops if the latter are neglected. In dry weather, when cold east winds prevail, young cabbage, cauliflower and savoy plants are soon attacked by aphis, commonly called cabbage green fly; the latter are rarely quite green, being of a slatey-grey colour. They first appear in the small central leaves—the tenderest—and suck the juices; then the leaves curl up and enclose the flies, which quite destroy the leaf and, in turn, others. These pests also do much harm to plants in a more advanced stage of growth, especially during spells of dry weather. If they are allowed to infest the plants wholesale, massing themselves in the inner leaves of the hearts, the latter will soon be quite spoiled. In all cases the simplest remedy is syringing violently with cold water in which a small quantity of common salt has been dissolved. Tobacco infusion and lime water also do much good. Quassia chips boiled for five to ten minutes in an old saucepan with a lump of soft soap added may afterwards be diluted freely and the liquid syringed on. Early attention is essential to success; prevent the aphis gaining a firm hold upon any plants.

Caterpillars of the white cabbage butterfly are about as destructive as the green aphis. Against these caterpillars there are not any remedies more effective than "Katakilla." It is a powder insecticide wash and, of course, non-poisonous. It is also a good remedy for aphis, psylla, capsid bug, etc.

Maggots of the gall weevil soon destroy plants of both summer and winter greens if they are allowed to become numerous. Their presence in the roots causes decay very often, and always a stunted growth. The galls or swellings they make are similar to those caused by "club." All old stumps and roots should be burned. Change of plot and gas lime at the rate of 6 oz. per square yard, applied eight weeks prior to cropping, will clear the soil of these destructive weevils.—HANTS.

CARDOONS AND CELERIAC.

BOTH these vegetables need attention now. If the cardoons were raised under glass, it is time to transplant the seedlings outside, but if the seed was sown in the open in trenches, all that is necessary is to thin out the seedlings to 20ins. apart. Cardoons should be grown in trenches similar to celery trenches, and during the growing season plenty of water should be given. By September blanching of cardoons should be started. This is done by tying brown paper collars round each plant, wrapping round with hay ropes and then earthing up gradually. Blanching takes about six weeks. Celeriac seedlings should be planted out 9ins. apart on level, well-dug ground, and grown on until late autumn like turnips. Any lateral growths which form should be carefully removed. Protection should then be given during the winter by covering up the plants with soil.

MISCELLANEOUS

GATHERING HERBS: TREATMENT OF BEDS.

HERBS should be gathered when the plants are in full flower or just coming to that stage, as then their full strength will be secured. About mid-day on a sunny day is the best time for cutting the herbs that are to be dried and stored in due course. If gathered while wet, even if they are afterwards very carefully dried, there is always a risk of mustiness about the leaves and stalks, and this should not be. Nearly all kinds of herbs should be stored in a dry state, but the following should be attended to with the greatest care, namely, sage, mint, thyme, lemon thyme, balm, borage, horehound, hyssop, lavender, pot marjoram, pennyroyal, rue, rosemary and wormwood. Cut off the stems fairly low down so as to preserve as many leaves as possible, lay out the cut herbs

Digitized by Google

unbunched on paper, in a cool, dry, airy shed; turn over the thin layers several times and when rather dry, bunch all, making small bunches; tie each one tightly by the extreme ends and suspend them from the roof in a dry shed or in a cupboard. If against wood or brick walls, place sheets of paper behind them and over them if suspended from the roof; this is to keep them free from dust and other foreign matter.

The surface of the soil of the borders should be freed from weeds and then lightly forked up. Do not apply manure now, but a nice layer of well rotted leaf-soil and leave all neat and clean for the winter.—CHRISTCHURCH.

THE TOPS OF WALLS.

HOWEVER pleasing a suburban garden may be, there is usually one point that is overlooked: this is the bare top of the surrounding brick wall, which is either surmounted by a barricade of unsightly broken glass or merely left as a promenade for cats.

There are several ways of beautifying the top of an ugly wall, and this is the best time of the year to set about it, so that things may be well settled by the spring. As cats always have to be contended with in towns it is well to fix two boards to the sides of the wall, rising about 2ins. above the top, and to cover the upper edges of these with broken glass; this will be just as effective as a whole wall full, and will be hidden when the top of the wall is planted.

A quantity of fairly thick sods should now be cut to the required size, and placed turf side downwards along the top between the boards, which will hold them in place. After they have had time to settle, any shallow-rooted plant may be set, but by far the best for this situation are arabis and aubrietia; these will spread with great rapidity, and will soon cover the top and begin to fall down the sides of the wall.

Crocus corms may be planted as soon as the sods have settled, and will bloom the following spring. Wallflowers and the various stonecrops will also do well, and need little attention beyond frequent watering during dry weather, as they have little depth of soil. If small ferns are planted they will need an extra supply of water.

If you are fortunate enough to have a stone instead of a brick wall, with large rough stones on the top, much can be done by filling all the crevices with soil and planting small alpines. This method has the advantage of looking less artificial than any other. Another method is to fix narrow window-boxes on brackets on the inside of the wall on a level with the top; but they always look clumsy, and have a habit of falling unless very strongly fixed.

All woodwork used should either be painted green or covered with bark, to make it look as natural as possible. The two most important points to remember are to use only plants that require comparatively little root room and to supply plenty of water throughout the summer.—M. J. D.

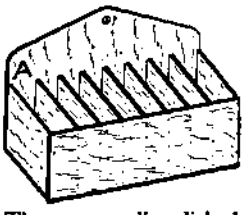
WOODLICE.

MUCH of the damage commonly attributed to slugs is really caused by that worst of all garden pests, the woodlouse (Oniscus). These little creatures, which, as distant relatives of the crabs and lobsters, are not insects at all, are familiar to most people by their greyish colour and curious habit of rolling themselves into a ball when at all alarmed. Strictly speaking the woodlice belong to the great army of nature's scavengers, in that they feed on all kinds of decaying vegetable matter. Unhappily oniscus does not content itself with a diet of this kind and is only too ready to turn its attention to almost anything that grows, especially if this happens to be something tender and juicy. Woodlice are terrible pests in greenhouse and frame, but they are often equally troublesome in the open border. Where any plants have been mysteriously attacked, always suspect woodlice. These creatures are largely night feeders and, during the day they remain in hiding. Turn over any leaves or stones that happen to be about, or search between the stems of herbaceous plants, and here you will find the little creatures.

Fortunately, this habit of hiding on the part of woodlice makes them easy to capture. A few pieces of slate placed on the soil and examined during the daytime will yield numbers of the pest which may be collected and destroyed. A better way is to set one or more traps, arranged in this manner. In a small flower pot put a cold boiled potato. Cover the potato lightly with moss. Sink the pot to the rim in the soil and examine each morning. It will be found that the woodlice gather in hundreds in the pot not only to secure the shelter provided by the moss, but also to feast on the potato, of which they are particularly fond. A few traps of this nature will go a long way towards exterminating the oniscus or at least reduce its numbers to reasonable proportions.—S. LEONARD BASTIN, *Bournemouth*.

METHODS OF SEED LABELLING.

THE importance of carefully labelling seed-beds should not be overlooked, since, when quite a number and variety of seeds are sown, it is an easy matter to sow one kind twice if reliance is placed on one's memory. A common method is to fix the empty seed packet on a stick pushed into the ground at the head of the seed-bed. This has a great disadvantage, since rain and wind will soon destroy the packet and render the indicator useless. The following is quite a good method of labelling seed-beds: First of all a number of wooden indicators are made.



These are well polished with sandpaper and then given two coats of white enamel. Now, using black enamel, print letters on the face of the indicators. In conjunction with the indicators a chart is prepared in the garden notebook. For instance, two beds of seeds may be sown, beginning with the letter A. Print A on one indicator and A1 on the second indicator. The full name of the seed indicated by A is entered on the notebook chart with the letter A in the left-hand corner, and likewise the letter A1. The indicator marked A is fixed in the ground at the head of the seed-bed, corresponding to the name of the seed marked A on the chart, the same method being employed with A1, A2, etc. Corresponding letters are used on other indicators for seeds beginning with letters B, C, D, etc. By adopting this method of labelling a proper record of seeds sown may be kept. The indicators will stand any weather, and when not required are easily cleaned and packed away. The writer finds three-ply wood very suitable, which is readily cut to shape by means of a small saw. In connection with the indicators, the box illustrated may be used, in which packets of seeds are kept. The box is made from three-ply wood, and letters are printed above each division into which are placed packet seeds, the names of which begin with the particular letter. The box is fixed in any convenient position, from which the seeds may be taken when required. This method of labelling and keeping packet seeds in order will give pleasing results and is well worth trying.—W. J. SAUNDERS.

INSECTICIDES.

ONE of the most aggravating results of the stagnation of growth which was subject of general complaint throughout the month of May is that aphis, lice and sucking insects in variety obtained a stronger foothold upon the tender shoots of plants than they are able to do when spring growth is very rapid; and, in the natural order of things, any insect pest which gets a good start proves extremely difficult to dislodge from its stronghold. It is imperative, however, that industry, skilfully applied, shall gain the mastery over the enemies of plant life—and promptitude is just now of vital importance for a combination of reasons.

Insecticides for summer use are plentiful in number and varied in character, but some discretion is necessary in selecting something suitable to the particular conditions of individual cases.

Nicotine is unquestionably a powerful and efficacious insecticide, and in the flower garden during the greater part of summer the nicotine washes prepared by well known firms of high standing are among commodities which may well be considered indispensable. Anything in the nicotine line which bears the name of G. H. Richards, Corry, Matthew Campbell, or Abol Limited, may be depended upon for quality, and the quality of nicotine rests in its power of poisoning in a way of its own. An insect, whether fly or caterpillar, when coated with nicotine becomes paralysed, and unless it manages to get clear of the fluid and its fumes it is bound to die. By mixing the nicotine with a soapy and moderately sticky substance it is made first to spread over an extended area of leaf and stem, and over the entire body of any insect with which it comes in contact, and to adhere closely to either, thereby making doubly sure of fatal effect. It must be obvious from these remarks that a good nicotine spray is unsuitable for use on ripening soft fruits, such as currants, gooseberries or raspberries. It is safe, however, to use nicotine on hard fruits in July, which will not be eaten before September or October, because by that time the poison will have evaporated, but it is very essential that thought shall be given to undercrops, for any such vegetables as cauliflowers, spinach or French beans, also salads, parsley, herbs, mint, etc., which are inadvertently saturated with nicotine spray are liable to cause considerable discomfort, if nothing worse, to any person who may eat of those crops. For kitchen garden use in July or August it is, therefore, prudent to choose a non-poisonous wash, and, fortunately, there are preparations which are harmless to human beings but which possess considerable insecticidal power either as direct destroyers or as discouragers, the latter term indicating that their presence on a plant discourages moths, butterflies, chafers and other breeding females from depositing their eggs upon such a plant. Quassia forms an important ingredient in some of these preventive sprays, and petroleum or paraffin emulsions are also very useful. Both are usually mixed with soft soap or some preparation of a saponaceous character. Let me, however, utter a word of caution regarding the frequently recommended idea of mixing ordinary paraffin or lamp oil with soapsuds. It is extremely difficult to mix effectually such oil in a manner that ensures safety, and with the various proprietary insecticides which are skilfully prepared and put up in convenient canisters to meet the requirements of gardens of all sizes there is little occasion to run the slightest risk of damaging any plants with uncertain home-made mixtures.

Harmless, but very effective insecticides are the well known Abol, Katakilla, Kilzall, Cirengol and the quassia-tobacco insecticides advertised in the columns of THE GARDEN.—L. I. ATRIS.

SWEET PEAS AT CHELTENHAM

IT would be difficult to find a more beautiful place for a flower show than the Montpellier Gardens at Cheltenham, where the National Sweet Pea Society held its annual show on the invitation of the Cheltenham Chamber of Commerce on June 30th and July 1st last. The Sweet Pea Show was associated with the annual floral fête of the Spa, and the combined entries were so numerous that 800ft. run of tents were required to contain the exhibits.

As ever, the chief spectacular effect was made by the large trade groups in competition for the City of Bath and the Eastbourne Challenge Cups. Rather more space is allowed for the latter, while in the former competition the flowers included in it must have been grown without shading of any kind. This debars the inclusion of a few varieties principally of orange and scarlet colouring which "burn" when exposed to the full glare of the sun. The need for this restriction is not likely to continue for very long, inasmuch as many of the newer varieties of the shades of colour above named are much more sunproof, and as the annual trials of the Society are grown absolutely in the open, no variety, be it ever so beautiful, is likely to obtain the Society's coveted award unless it be quite sunproof.

At this time of the year all the flowers were grown out of doors—the season of sweet peas grown under glass has been and gone. The Eastbourne Cup was won by Messrs. Sutton and Sons with a magnificent group of exceptionally high quality. Perhaps the outstanding feature of this collection was the intense colouring of such brilliant varieties as Magnet, Royal Scot, Charming and Coraline, while George Shawyer, Powerscourt and Sutton's new white Avalanche were also of very high quality. A large gold medal was awarded to Messrs. Dobbie and Co. for another magnificent collection, and this included Bellford (a new pale cream-coloured variety with an occasional blush flushing), Geneagles (another of their good novelties), Patience, Constance Hinton, Wizard and Britannia. Messrs. Ireland and Hitchcock won a gold medal with an artistically arranged group. Three hanging baskets, which were placed midway in the group, contained splendid spikes of Magnet, Powerscourt and a fine orange-coloured seedling. They also showed Orion of lovely colouring, Lady Keeble (large flowers of salmon-fawn shades), Mauve Prince, Matchless, Powerscourt and their beautiful lavender Lord Lascelles, which received an award of merit two years ago. A silver medal was awarded to Messrs. James Carter and Co. for a tasteful collection of the pink Annie Bowness, which is so effective in the garden, King Mauve, R. F. Felton, 2 LO, Charming, Hebe and others.

Groups of sweet peas were even more numerous in the City of Bath Cup competition. This cup also was won by Messrs. Sutton and Sons, but not so easily as in the former case. They had a very fascinating arrangement of pillars and baskets rising above stands of massed spikes. The chief varieties were Magnet, Hawlmark Pink, Doris Usher, Matchless, Peggie Coraline and Charming. Messrs. Dobbie and Co. were again awarded a large gold medal for an imposing collection of excellent spikes. Their arrangement was very graceful. The principal varieties were Picture, Warrior, Camellia, Elegance, Renown, Magnet and Charming. Mr. J. Stevenson won a gold medal with a fine collection, among which were Magnet, Coraline, Charming, Ivory Picture, Wembley, Purple Perfection and Diana. Messrs. E. W. King and Co. also had an admirable collection, and they included their new varieties Jack Hobbs, Derby Day and Gladys, with Pimpernel, Constance Hinton and the purple Olympia. Silver medals were awarded to Mr. W. J. Unwin, Messrs. W. T. Payne and Son and Messrs. E. Abbott and Sons.

In the chief open classes the principal prizewinners were Sir Randolf Baker, Bt., Ranston Blandford, whose prizes included the Sutton Cup for the eighth successive year and five first prizes in the colour classes. Mr. F. W. Franks, Loampits, Tonbridge, was an exceedingly successful exhibitor. His magnificent exhibit of twelve distinct varieties won the first prize in the *Daily Mail* class, was selected as the best exhibit in all the amateurs' classes, and included the best vase in the Show. He was also a successful exhibitor in the colour classes and had the first prize exhibit of British raised novelties, where he included Coraline, Royal Purple, Fair Lady and Wild Rose of great beauty. In the seedlings classes the best three novelties were Royal Mauve, Delight and Rosy Morn, while the best vase of any one novelty was that of Mrs. A. Searles, which may be considered the outstanding new sweet pea introduced this year. It was raised and shown by Mr. H. J. Damerum.

The champion novice of the year was Mr. N. S. Stacey of Ilfracombe, who won the chief silver medal in the division.

Miss Gwendoline Zelley, won both first prizes in the dinner-table decoration classes with very tasteful arrangements, and Miss Russell won the first prize in the class for a decorated occasional table.

CLAY'S LONDON FERTILIZER TRADE MARK

CLAY'S FERTILIZER

The Gardeners best friend

GOOD SEEDS will never give of their best in poor soil. Help both seed and soil with CLAY'S FERTILIZER and then, together with nature, your garden will be a source of profit and enjoyment during the coming months.

CLAY'S FERTILIZER can be purchased anywhere at the following prices:—

Tins 10d. and 1/6
and in Branded and Sealed Bags:
7 lbs. - 3/6 14 lbs. - 6/-
28 lbs. - 10/- 56 lbs. - 19/-
112 lbs. - 32/-

or if there should be any difficulty in getting it locally, we will send it direct to you from our Works, carriage paid in the United Kingdom for cash with order (except Tins).

Every Tin, Bag and Seal bears the Trade Mark.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty	Pale rose and deep red.
Lohengrin	Cattleya mauve.
Mdm. Chereau	White, frilled azure blue.
Mrs. H. Darwin	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme	Pure blue and blue purple.
Prosper Laugier	Bronzy cinnamon and velvety crimson.
Rhein Nixe	White and violet purple.

One plant each of the 12 varieties, **7/6** post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE HARDY FRUIT GARDEN.

So far as can be ascertained at present, the apple crop is a poor one, and it will only be in isolated instances where thinning of the fruits will be needed. Moreover, the trees suffered badly from attacks of aphis, especially in gardens surrounded by forest trees and woodlands. In such gardens now is a good time to mark specimens for removal next winter, because it is at this season that the lack of light and air is apparent, rather than when the trees are denuded of their leaves.

Pears have set fairly well on established trees, particularly those afforded the protection of a wall, and unless a portion are removed, the fruits will lack size. The fruits will also benefit by the pruning or shortening back of the young shoots to the fourth or fifth leaf. Such work should be done gradually, otherwise it would have a prejudicial effect. It is a useful rule to start pruning at the top part of the tree, and leave the lower half, where growth is not so rampant, for a few weeks hence. These remarks apply to wall-trained and cordon trees, but a little summer pruning will be needed, also, for bush and pyramidal trained trees, often seen growing in the kitchen garden. Specimens making little growth will not require any summer pruning. Other examples will be extremely vigorous, and here pruning will be necessary, but it is advisable to label a few of them for root pruning directly the leaves have fallen. It is often the only method whereby fruitfulness can be restored.

Morello Cherries are colouring and nets must be provided to prevent birds taking the fruits. Before fixing them, however, the young shoots should be tied in, at the same time exposing the fruit as much as possible.

THE FLOWER GARDEN.

Much has been written concerning the genus iris, but not enough has been said about the I. Kæmpferi section. They are among the most beautiful of plants suitable for growing on the margins of streams and pools. It is not generally known that they can be readily raised from seeds, if sown soon after it is ripe. A few of the best flowers should be marked for this purpose. Sweet peas will need close attention, and if the weather proves dry the roots will require a thorough watering. When the soil is moist a weekly application of weak liquid manure from the cowsheds will be beneficial. If this is not available, a light dressing of an approved fertiliser may be sprinkled on either side of the row and watered in. Remove all faded flowers and seed vessels directly they appear and any growths that need it should be tied to the sticks. Many keen rose growers secure a few briars from the hedgerows during the winter months with the object of budding them in due season. Such work can be done when the sap is flowing freely and this is usually in July. When the bark will rise easily from the wood and the buds will part readily from the trees or bushes it is intended to increase, there will be little difficulty in securing a successful union. Keep everything moist during the operation and tie up with raffia before the air has a chance to dry up the bud.

THE ROCK GARDEN.

A fine early-flowering subject is Primula Wanda, a hybrid of P. Juliæ, and now is a suitable time to divide and replant in a good, loamy soil. A slightly moist position is best, and where it is partially shaded. Other primulas which have been flowering recently should have their old spikes removed, unless seed is required, and the plants can be top-dressed with leaf-mould and a little sand.

THE KITCHEN GARDEN.

With the exception of May Queen, the potato crop is looking well and the earlies are producing fine crops. If disease appears among the latter, they should be lifted and the haulm destroyed by burning. The later or main crop should be sprayed with Bordeaux Mixture. It is time the late crop of celery was planted out, and the early row can be partially earthed up. Before doing so remove all weeds and decaying foliage and tie each plant with raffia to prevent soil entering the centre. If the soil is at all dry, give the trench a thorough watering the day previous to earthing up. Herbs in some instances will soon be in flower and ready for cutting and drying. Dry them gradually in a cool, shady spot and later on tie in bunches and suspend in a dry, airy place until needed. Gradual drying is essential, otherwise much of their flavour will be lost.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

Spring Cabbages.—There are differences of opinion as to when the seed of these should be sown. As a strong plant is a necessity before winter, to obtain such in this locality it has been my practice for years to sow about this date, preferring to risk an advanced growth—which can be retarded by partially lifting and retreading the plants later—than have them too small to winter safely. The selection of suitable kinds is also as important as the date of sowing and the choice of adaptable kinds is limited. Three varieties I have used for years are Harbinger, Sutton's April and Flower of Spring. Make the ground firm, sow in drills sufficiently wide apart to admit of hoeing between, and water the drills before sowing if the soil is dry. Also make a small sowing of onions for spring use as an insurance against the later ordinary sowing being retarded in growth through the inclemency of weather during August and September.

Leeks for the winter supply are now fit to plant out in rich soil. Mark off drills 1ft. apart and 3ins. deep, dropping the plants in holes about 8ins. deep, filling these holes with water, if needful. The combined depth of drill and hole will furnish a suitable length of blanch, which can be increased by lightly earthing up the plants in autumn. The "smalls," if planted later in ground cleared from a previous crop and liberally fed throughout the autumn, will provide a good succession of useful plants for spring supply.

Spinach.—Sow now for autumn and winter pulling, using the prickly seeded long standing variety. Sowing the seed in groups of four to six seeds 8ins. apart economises seed and facilitates thinning.

Lettuce and other salads may yet be sown with every prospect of reaching maturity out of doors.

Onions now beginning to form bulbs will appreciate a little stimulant. Nitrogenous manures require to be used with caution or a grass leaf growth will be formed at the expense of the bulb or soft bulbs that will not keep will be produced. Better results are obtained by applying ½oz. of phosphate of potash or 1oz. superphosphate per gallon of water. Greyish patches appearing on foliage presage an attack of mildew which should be prepared for by dusting with lime or spraying with liver of sulphur. Continue preventive measures to checkmate egg-laying by onion fly.

Carrots, too, are not yet beyond an attack by a late brood of maggots, therefore the measures to ward it off should not be relaxed. Continue to cultivate between the lines as long as may be done without injury to the foliage.

Peas of late varieties should be kept as cool as possible in dry weather. Give water in time and in liberal quantities, conserving this by hoeing or applying a mulch. Mildew usually follows a spell of drought, especially in light soils, for the which spray with liver of sulphur.

Broad Beans should be adequately supported in the lines by running strings on stakes on either side of the row. Pinch out the tips of the plants when there is a good show of blossom, as well to get rid of any black fly there may be as to hasten the formation of pods.

Celery will benefit by plentiful supplies of water. As the plants grow remove all side shoots, protect the leaves from the fly by light dustings of soot or lime. Spray early and frequently with Bordeaux mixture as a preventive of celery leaf blight. Complete the earthing up of late potatoes, leaving the ridges sharp to throw off late summer and early autumn rainfall—which brings disease—on to the lower slopes. Spray with Bordeaux mixture for leaf blight.

Doune, Perthshire. W. MCCARRELL.

PENTSTEMON DAVIDSONII.

AMONG the few shrubby pentstemons which we have in cultivation in our rock gardens a high position is taken by that named Pentstemon Davidsonii. It is a truly charming plant 2ins. or 3ins. high, with pretty glaucous green leaves and striking little flowers of a brilliant red. I am not disposed to acquiesce in the diatribe launched at the colour of the flowers by a high authority, who tells us, *inter alia*, that what he calls "aniline-red-mauve" flowers are terrible to look upon in full sun; I fancy that most folks will agree with me that this is an exaggeration. It is not difficult to cultivate on a level part of the rock garden in peat, sand and loam and in a sunny place. It is one of the many plants which call for top-dressing in spring and autumn.—S. A.

TRADE NOTES.

THE new form of lime dressing known as "Ferry"-Phos-lime is, indeed, an excellent one. It is a natural combination of phosphates and lime, containing 45 per cent. carbonate of lime and 35 per cent. of phosphates. It is well known that lime is essential for the maintenance of soil fertility, and this material not only supplies lime to the soil in the best possible form, *i.e.*, in a very fine state of division, but it also adds a liberal dose of phosphates, one of the all-important plant foods. "Ferry"-Phos-lime is non-caustic and is suitable for all kinds of crops and types of soil. It is a product of The Briton Ferry Chemical and Manure Co., Limited, Briton Ferry, South Wales.

SWEET PEA COMPETITION
£50 IN PRIZES

RULES.

A list of your choice of the six most popular sweet peas to be sent in in order of preference on the coupon to be found on page ii of this week's issue of THE GARDEN. *No alternative* varieties will be allowed in the one list, but readers may send in any number of lists, provided that they are written on the special coupon to be found in this and the following issues of THE GARDEN.

Coupons must reach this office not later than Saturday, July 31st (after which date no coupons will be accepted).

The popular vote will be final, and no correspondence will be entered into over this competition.

Envelopes must be marked *Competition* and addressed to THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

The Editor will not be held responsible for letters missing in the post.

The result will be announced in THE GARDEN in the issue of August 28th.

The prizes are awarded to those whose list corresponds most closely to that arrived at by the popular vote.

If two readers tie for the first place, the first and second prizes will be equally divided; if two for the second place, the second and third prizes will be equally divided.

The Editor's decision on all points will be final.

PRIZES.

1ST PRIZE.—Goods worth £30 from any advertiser in the pages of THE GARDEN.

2ND PRIZE.—Goods worth £10 from any advertiser in the pages of THE GARDEN.

3RD PRIZE.—Goods worth £5 from any advertiser in the pages of THE GARDEN.

20 CONSOLATION PRIZES of 5s. each from any advertiser in the pages of THE GARDEN.

SPRAYING MEANS SAVING

Keep your trees and plants clear of insect pests by regularly spraying them with insecticide — and

use the **ECLIPSE** *"The Sprayer of a thousand uses."*

for the purpose. It is light, easy to handle, no pumping, no back-wash, can be used in any position and allows both hands free to control the spray. Can also be used for disinfecting, limewashing, etc.

Obtainable through any agent. Write for Booklet "War on Disease."

THE GLORY OF JUNE

THE TALL BEARDED IRISES make a brave show of colour in the garden at a time when flowers for cutting are not too plentiful. These should be planted now to get well-established plants to bloom next season. Our stocks are strong and healthy and we have a wide range of beautiful varieties.

Britain's Great Cabbage.

WEBB'S EMPEROR CABBAGE.
The earliest, best and most popular Spring Cabbage in cultivation, 4d., 6d. and 1/- per packet, 1/9 per ounce. "Your Emperor Cabbage has again proved worthy of the name you give it, 'Britain's Great Cabbage.' I should like to go one better and describe it as 'The World's Best Cabbage,' as year after year it proves highly satisfactory with me as with others to whom I supply plants. I put in the Seed the third week in July, 1925, and was cutting splendid Cabbage April 18th. I did not have one bolt, and for quality and early productiveness it has surpassed all others."—F. DALE, Esq., Leamington Spa.
WEBB & SONS, LTD., THE KING'S SEEDSMEN, STOURBRIDGE

EFFICIENCY IN THE GARDEN

MANY of our readers will probably have noticed how much importance we place in the technique of gardening; that is to the many technical methods that have to be understood if plants of the highest quality are to be grown. It may seem that I am constantly drawing attention in these editorial notes to the necessity of understanding the requirements of plants and of paying great attention to their correct cultivation if they are to give of their best. It may be said that life is too short for any individual to learn the intricacies of the correct cultivation of a host of plants; but that is not ture. Once proved to be successful the lesson is there and does not have to be learned another year. Also, in most cases modern methods are a saving of labour, not an increase. On the other hand, it must not be expected that everything can be learnt in a day.

In the course of the year many gardens are seen, new and old. The old for the moment we can leave alone, for those who work in them have probably learned from experience the limit to which they can go. It is to some points about new gardens that I wish to draw attention. The owner of a new garden, or a garden in the making, or a garden only planned on paper, often flies too high to begin with. A plan may look well on paper, but I have noticed that it is only too often designed before the preferences of the owner in the way of plants are formed. He may like flowers in a general sense but have no decided views in which direction his tastes lie, whether rock garden, shrubs, bulbs, herbaceous or annual border. He sees the plan, expresses satisfaction and the work is commenced. Often it exists only as an architectural shape, and imagination will not carry him far enough to see it as a finished entity three years hence. The immediate surroundings of the house should, of course, be settled once and for all, but I do suggest, where preferences are still undecided, that a portion of the area of the garden, however small, should be left until a definite line of gardening is settled on. It saves much trouble in the future. I have noticed with dismay the haste with which a new garden is finished on many occasions. The preparatory work, so very important, is skimped, and plants are shoved in, often in a haphazard fashion. Everything is carried out in a hurry, to give an immediate result. This does not make for efficiency. It is often doubtful if the area gardened is not too large for the labour at the owner's disposal. Plants will fail and their failure will be laid to the plant, not to lack of preparation and cultivation. It is much better to ignore the immediate effect and see that a portion is properly dug and manured and planted. Take a herbaceous border, for instance; thorough preparation and a due regard for the quality of the plants therein means that it will not need much attention for three years. In the meantime other portions can be thoroughly dealt with, and so, in time, a garden will be formed that is not only well made and properly planted, but also fits in with the owner's personal likes and predilections. Successful alteration is one of the most difficult of all garden tasks, and all alterations should be avoided as much as possible.

The magnificent exhibits that are staged by the trade throughout the country, and particularly at the fortnightly shows at Vincent Square, perhaps set such a standard, not only of excellence of variety but also of cultivation, that it is difficult for the amateur to attempt to reach such heights. It may be said with truth that it is hopeless for the ordinary gardener to try to compete with specialists, but this high standard is necessary, if only to show what can be done. It is the fact that it is almost unapproachable to the amateur, who may try to grow dozens of plants in a small area, that it is constantly egging him on to greater effort. Certain neighbourhoods and soils suit different plants, and it is always as well to find out what succeeds in your neighbourhood before your garden is completed. If you have a sufficient groundwork of well suited plants to make your garden a pleasant place, then you can start off experimenting if you like, but not before. But whatever you do, do not skimp your cultivation. Much can be done with the greatest weed with care, and the converse is equally true: the finest variety may be a hopeless failure if it is maltreated. E. H. M. C.

OUR SWEET PEA COMPETITION: £50 IN PRIZES

Owing to the fact that for some districts this competition opened too early, we are putting off the closing date to July 31st.

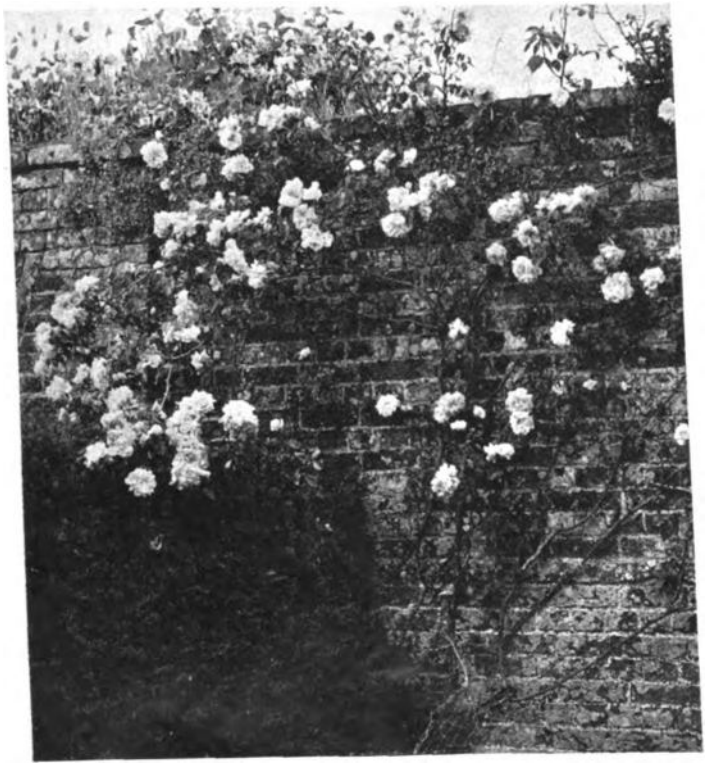
CLIMBING HYBRID TEA ROSES WORTH GROWING



WALL ROSES.

THE mystery is still unravelled as to why roses and other flowers should produce "sports"; for these climbing forms of various roses are but "sports" from the original variety. Doubtless, if the cause were known, we should have climbing sports of most of our popular roses, for no one can discount their value in the modern rose garden.

But why is it that we have a comparatively new variety like Sunstar giving a climbing sport a year after its introduction, and in an old variety like Mme. Abel Chatenay we had to wait over twenty years before a climbing sport appeared?

The rose is, perhaps, more inclined to sportiveness than any other flower, and our collection contains many valuable additions by this means. For instance, Mme. Butterfly from Ophelia, Lady Roberts from Anna Olivier, W. E. Wallace from Gorgeous, and probably Wm. F. Dreer from Los Angeles, or *vice versa*, for I have had Wm. F. Dreer appearing on a plant of Los Angeles and also Los Angeles on Wm. F. Dreer.

I am glad to find the general public are becoming more inclined to plant these climbing hybrid teas, and when they are properly handled their value will be fully appreciated. Grown as pillars they are most successful, and, in a way, they lend a dignity to the rose garden. Standard roses, when well developed, make a glorious show, but some object to the bare stem of the standard rose, whereas with a pillar rose we may have blossom from base to summit.

I strongly advise little or no pruning of climbing hybrid teas the first season after planting. A rambler rose may be cut back hard the first season with advantage, but not so the climbing hybrid tea. If hard pruned some of the kinds are liable to revert to the dwarf form; but if left unpruned, in course of time strong basal growths will often appear the first year, and then the next year one or more of the original growths may be cut away and the basal growths take their place.

Some rosarians have complained of the shy flowering propensity of the climbing hybrid teas. I would ask for the exercise of patience. We do not expect a fruit tree to bear fruit the first year, and even the second year we do not look for much. The fact is, we need to encourage lateral growths on the long upright shoots. These laterals are pruned fairly hard the second year, and usually flowers will appear. But in some varieties it is from the sub-laterals—that is, laterals springing from the first laterals—that we obtain the best blossoms.

If we are growing these climbing hybrid teas as pillars—which is, perhaps, the best method, although they do well on walls—we may find them inclined to become lanky—that is, new growths do not come from the base, but about 2ft. or 3ft. from the ground. To check this, it is a good plan to form a tripod and twine the growths in a serpentine fashion around this. I have even seen them trained as we do an espalier fruit tree.

If a plant has become tall and gawky, take it down from the upright and twine it around three or more stakes, and it will soon yield young growths lower down.

Many of these climbing hybrid teas make splendid standards and, although not so graceful as the wichuraiana for weeping standards, yet they make nice spreading informal heads which are a relief to the somewhat rigid ordinary standard.

There are now nearly fifty varieties of these climbing hybrid teas and pernetiana roses. I need not allude to the older varieties, for they are so well known; but there are a few recent sports that cannot fail to be much sought after, and I will name a few of the best:

CLIMBING LOS ANGELES.—A true climbing form of this grand rose. Last season, under glass, I had growths 15ft. long.

CLIMBING GENERAL MCARTHUR gives us a brilliant red that will be very useful. This also has the true climbing habit.

CLIMBING MRS. HERBERT STEVENS will be largely planted and will supersede for outdoors the old climbing Niphetos.

CLIMBING SUNSTAR should be valuable, although I would not plant it against a wall, as it would be too evanescent.

CLIMBING GOLDEN OPHELIA will provide a fine golden colour, hitherto rather deficient in this group.

CLIMBING HOOSIER BEAUTY should be a real acquisition. We all know the glorious colour of the dwarf form. Its spreading growth does not make it a good bedder, but a fine pillar of this would provide a brilliant effect in the garden.

CLIMBING DEAN HOLE should be good, especially as a wall rose; also

CLIMBING MRS. EDWARD MAWLEY.—Exhibitors should find this latter useful. Where one possesses an old variety of little value on a south wall, I would advise budding it on nice young growths with Climbing Mrs. Edward Mawley. If all the growths of the old variety were cut away the following autumn save those that were budded, we should have a fine big plant the next summer.

CLIMBING MME. E. HERRIOT makes a grand flaming pillar, although it is less vigorous than some.

CLIMBING LYON ROSE should be a fine wall variety.

CLIMBING MME. BUTTERFLY may prove good, but we have already Climbing Ophelia, so it hardly seems to be wanted.

CLIMBING MRS. AARON WARD is fine, and its lovely orange buds will make it welcome.

CLIMBING LAURENT CARLE and

CLIMBING JONKHEER J. L. MOCK will be useful, for we all know how valuable these old fragrant roses are, although lately they have somewhat dropped out of favour.

CLIMBING WILLOWMERE may also be valuable.

If someone would now come along and give us a Climbing Golden Emblem, we should be well supplied with these beautiful climbing roses.

Although not grouped as climbing roses in the ordinary sense, there are a few others that may well be utilised for pillars, and these are Alan Chandler, Souvenir de Charles Denoyel, Miss Marion Manifold, Sunny South and Black Boy, all excellent and quite recent introductions.

WALTER EASLEA.

SOME OLD-FASHIONED PLANTS

IN dealing with a few of those old-time plants which were known and loved for generations in English gardens, but which have now for the most part fallen on evil days, I shall confine my references to those of special garden merit. Our affections for many a plant may be kept warm merely by sentiment, or long association, but there is a fair number of the old-timers which have, in addition, a more substantial claim upon us. These are things we cannot afford to lose. In spite of the inrush of novelties, their places have never been filled quite as they filled them. If some of them are all but extinct, there remain many which, though seldom seen in our modern gardens, are still obtainable in the trade, and that in itself is, I think, eloquent testimony as to their value.

Every now and then one or other of these old-world plants enjoys a revival, and this is heartening; it gives one hope for the fate of others. Take sweet rocket, for example. Hesperis matronalis fl. pl. has been known to us for nearly 400 years. Not long ago it was difficult to get a decent plant anywhere of this fragrant, stock-like plant. But it has recently shown signs of coming into its own to the extent of being used as a bedder in at least one northern municipal garden! H. matronalis fl. pl. will not do in my light hot soil as it does in some places, but it is always worth trying, especially the dwarf, compact Scotch strain.

Francoa ramosa, the maiden's wreath, and F. sonchifolia are rare in gardens, but both are hardy enough for all but the bleakest localities, as cottagers of years ago knew full well. In a very dry, poor soil they have flourished for many years with me, and last winter, which killed off most things in any way tender, left them unharmed. The 3ft. spikes of white, or rosy pink, are distinctly elegant; they are good for cutting, and are on show in August when so many border plants are going off, especially where the soil is thin and hot.

Another splendid plant that has suffered in public esteem from the supposition that it is too tender for outdoors is Lobelia Tupa, which came to us as Tupa Fuelli 100 years ago. "Never heard of it," is the remark of most people when they see its great pyramid of red-ribbed, foxglove leafage towering to a height of 6ft and terminating in bold spires of crimson-scarlet flowers. But this excellent subject is quite reliable under average conditions in a free soil, and, being strictly herbaceous, it is always possible to cover the crown with a mound of ashes

THE SWEET ROCKET, IN CULTIVATION FOR 400 YEARS, IS NOW IN FAVOUR AGAIN.

VIOLA CORNUTA SHOULD NOT BE NEGLECTED.

should any doubt exist. With similar treatment, Melianthus major, the honey plant, will make a ready response. Coming from the Cape two centuries ago, this handsome thing was at one time much more commonly seen in gardens and it is well worth reviving both as a flowering border and foliage plant. Its glaucous foliage, rising to 6ft., is, I think, much more attractive than that of Bocconia cordata when used for similar purposes, and M. major does not become a weed, as the latter is liable to do. Sown early enough, the honey plant will go up to 4ft. in its first season, and may thus be treated as an annual.

There is a quaint old-time flavour about the tradescantias, or spiderworts, which is always attractive, but it is a long time since I have seen any but those of the virginica set, and some of these, the double ones for example, seem now to be rare. With their extraordinarily wide range of vivid colours and the fresh green of their grassy leaves these plants make a delightful group in some partly shaded corner and they often look remarkably well in woodland with native ferns and other natural herbage.

Once a popular border plant, that charming relation of the spiderworts, Commelina cœlestis, is now scarcely ever seen. It is not so hardy as the tradescantias, but it is quite amenable to the sort of treatment we give to dahlias, and that a plant of such an exquisite blue should be so seldom grown is to our loss rather than to our credit. With a winter covering of ashes, this excellent subject should prove absolutely hardy and satisfactory with almost anyone. Under similar culture, Mirabilis Jalapa, the old Marvel of Peru, was once a popular plant in English gardens, but it is many a long year since I have seen it prospering in this country. Yet the extraordinary diversity in the colours of its flowers is always interesting, and I can just remember once having seen a large bed of the dwarfer M. multiflora making a brave old-fashioned display with its bright crimson flowers. All the above, and there are others of a like kind, were at one period in general cultivation, according to an ancient book before me, but for some unaccountable

Digitized by Google

reason they have been allowed to lapse, while their erstwhile companions, alstrœmerias and dahlias, have held their ground.

There is not a little evidence to show that Viola cornuta is not so generally grown as once it was. You may see it here and there, especially the plum-purple variety, G. Wermig—the least beautiful, in my opinion—but the old, old lavender blues, dark and light, the pure white, all with very much larger flowers than the above, seem to be slipping away from us as they did once before. That this should be fills one with amazement, for V. cornuta is one of the finest plants of its race that have ever come to our shores since it left its Pyrenean home 150 odd years ago. Very robust, possessing a wonderful constitution, extremely bountiful with its large blooms (often 1½ins. across) on their stiff, upright stalks, a plant that will flower abundantly and continually from May to September without any attention and in almost any soil, in sun or shade, even under woodland trees and in the grimiest of town gardens, V. cornuta is too precious a possession to pass over. And when one considers that, in spite of the fact that it is such an admirable rock garden subject, V. cornuta was more generally cultivated before the present rage for rock gardening began, the matter assumes a still more surprising aspect. V. cornuta may not be a better thing than V. gracilis or any other later popular introduction—comparisons are peculiarly odious in such matters—but V. cornuta stands alone on its own merits, fearing no rival, since it has none. It is hardly likely to slip out of our grasp, for it is much too useful in hybridising, as the multitudes of rock garden and other violas bear testimony. At the same time, it is up to us to have a care lest, in chasing the shadow, we lose our sense of proportion in regard to the substance.

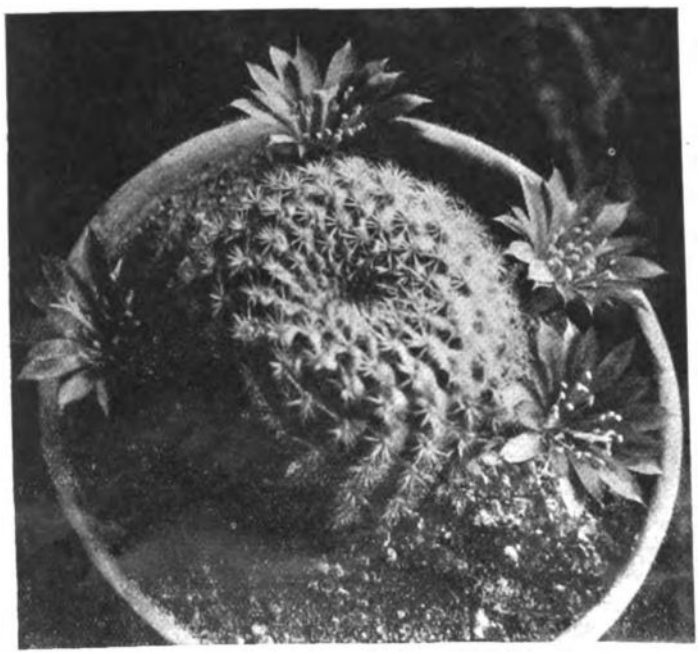
A. T. JOHNSON.

(To be continued.)

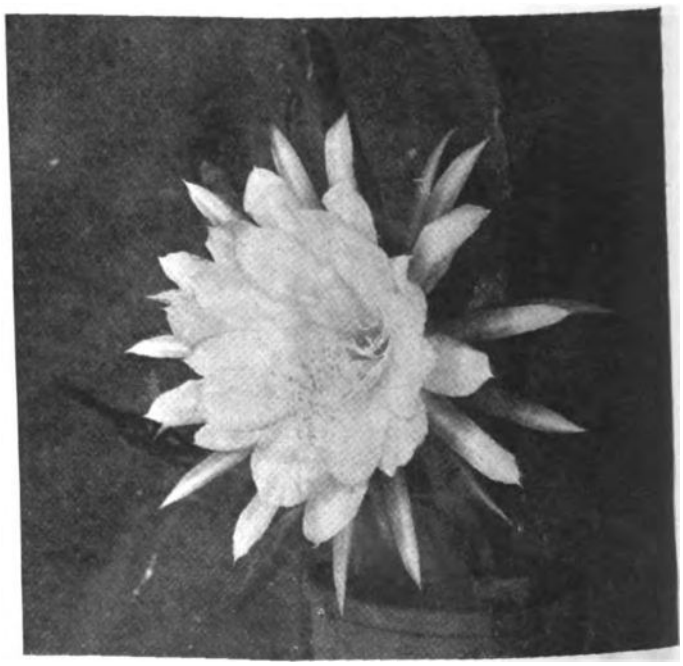
CACTUS FLOWERS

THOSE amateurs who wish to decorate their cool greenhouse with striking blossoms and of a kind not often seen might well indulge in the cultivation of flowering cacti. But it would certainly require a very large greenhouse to grow all the species of cacti flowers.

Cereus grandiflorus is one of the first of the wonderful night-flowering section of cacti, among which are undoubtedly found some of the most magnificent blossoms in existence. This species bears huge shining white blooms, often a foot in diameter, the beauty of which is enhanced by the masses of long golden stamens; these flowers also have an exceedingly sweet perfume. They usually open some time before midnight and last until morning, after which they quickly fade—so the enthusiast has to sit up late to see his pet in bloom. If, however, the flowers are cut just before opening and placed in water, they will last for several days. Once, when some of these beautiful flowers were due to open, invitations were issued to gardening friends to witness an opening of these great flowers in a greenhouse at night.



THE SCARLET FLOWERS OF ECHINOCACTUS MINUSCULUS.



PHYLLOCACTUS BLANDUM BEARS LARGE WHITE BLOOMS.

The neat little Echinocactus minusculus, shown in the illustration, bears a series of charming scarlet flowers, and is easily cultivated. There are some two hundred species of Echinocactus.

The beautiful white flower in the other illustration is a Phyllocactus blandum. Phyllocacti are, perhaps, more in evidence in greenhouses and conservatories than any other kind of cacti, for these plants are quite easy to cultivate and will produce their magnificent flowers regularly each year. At the end of June, when the flowering period is over, the plants may be placed out of doors under a south wall in the full sun, water being given occasionally in very dry weather. In the autumn, not later than the end of September, they should be returned to the greenhouse and kept as dry as possible, only being watered occasionally to prevent shrivelling. This open-air treatment is very beneficial and helps the plants to recuperate in readiness for the development of the following season's flowers. Plenty of water must be given when they are blooming. The flowers of Phyllocactus Tettani, are a rich crimson shot with violet.

All these were grown by an amateur in an ordinary cool greenhouse. Pots about 5ins. across the top and filled with a compost of two parts fibrous loam and one of coarse sand being the most suitable. But first fill one-third of the pot with drainage material, such as crushed brick. About half an inch of sand alone should complete the filling on top of the compost.

When first planting cuttings of these cacti flowers, see that they are dry, for if a cutting is planted immediately it is liable to rot. New pots should be soaked in water and dried off before being used. Very little watering should be done except during the summer months.

Slugs, by the way, are rather partial to phyllocacti, so one needs to see that these pests do not leave unsightly holes and mangled remains.

D. H. MATHESON.

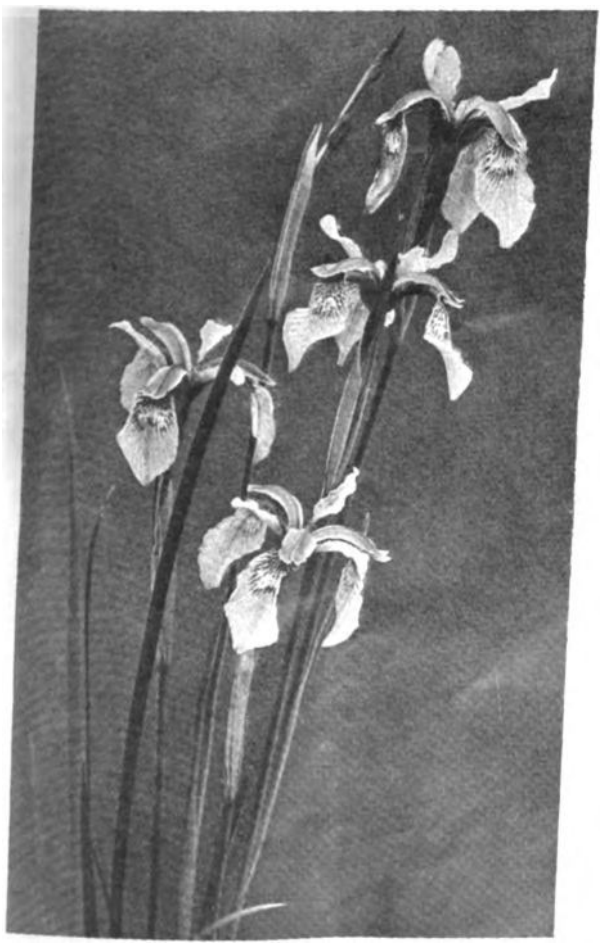
SOME USEFUL IRIS HYBRIDS

THE entanglement in the nomenclature of irises is so great that it would occupy more space than the Editor would permit to give anything like a concise account of the varieties now in cultivation. Moreover, it will probably be of greater interest to readers if I confine myself to those hybrids of the Chinese, Japanese and American forms. Many of these recently introduced hybrids certainly present several interesting features. The general habit is all that can be desired. With their neat grassy foliage, stout flower-stems and well balanced flowers they lend themselves to garden decoration and are valuable as cut flowers for the house. In the garden borders or fringing the waterside or bog garden, they are most ornamental, and if planted along with other rock and alpine plants the dwarfer-growing kinds are extremely effective on the rockery. They give pleasure and delight wherever grown to all who see them. The advice generally given as to use of lime in the cultivation of the bearded irises (I. barbata) is not recommended for the beardless species and varieties, and must be avoided. All the following hybrids are of easy cultivation and quite hardy, and may be successfully grown in any good ordinary light sandy loam in a fairly moist situation and in a position where they have the full benefit of the sun. When established they may remain undisturbed for several years.

Seed may be sown any time during the autumn in well crocked pots or pans in a light sandy and friable loam, the pots plunged in a cold frame or in an open situation until the spring, with an equable moisture, but never water-logged. When the young plants are large enough—from 4ins. to 6ins. high—they may be planted in their permanent quarters, and many may be expected to flower within the year.

I. CHRYSOFOR (chrysographes × Forrestii).—It is almost impossible to over-estimate the value of this as a decorative border plant. The graceful, upright, grass-like foliage, and numerous stout flower scapes from 12ins. to 18ins. h go, crowded with large, handsome flowers in various shades of bright golden yellow and blue, canary and blue, white and blue, to purple, provide a most glorious effect during May and June.

IRIS TEWAT, WITH PURPLE TO INDIGO BLUE FLOWERS.



IRIS DELFOR, A CLEAR DRESDEN CHINA BLUE WITH YELLOW MARKINGS.

I. CHRYSOWEGII (chrysographes × Hartwegii).—The distinctive glaucous, grass-like foliage is effective, and enhanced by the wonderfully free-flowering upright stems with abundance of rich royal purple flowers on scapes from 24ins. to 30ins. tall; late June.

I. BULLEYGRAPHES (Bulleyana × chrysographes).—A hybrid that ought to be included in all collections on account of the intensity of its colour, its bold green grass-like foliage and free-flowering qualities. The handsome violet-purple flowers are borne on erect stems, with a conspicuous golden blotch on the falls. May and June; 24ins.

I. DELFOR (Delavayi × Forrestii).—A most distinct and beautiful hybrid. The flowers are a clear Dresden china blue, with bold yellow markings on the falls; 24ins.

I. DOUBRACT (Douglasiana × bracteata).—An interesting hybrid of the Californian species. The graceful, evergreen, grass-like olive-green foliage is decorative well into the winter. The large open flowers are a pretty shade of soft canary yellow, and the falls are heavily stained rose; 12ins. May and June.

I. TEBRACT (tenax × bracteata).—Most profuse flowering, and may with advantage be planted on the rockery. The plants do not exceed 12ins. high, with grass-like foliage and pretty soft yellow flowers, falls varying from soft azure blue to soft rose. May and June.

I. TEWAT (tenax × Watsoniana).—A very pretty intermediate hybrid between two Californian species. The flowers vary in colour from purple to indigo blue; 15ins. high.

I. LONGSIB (longipetala × sibirica), with tall, erect stems, 2½ft. to 3ft. high, is well adapted for the bog or waterside, having abundance of glaucous grass-like foliage and pale blue flowers. May and June.

WM. LOGAN.

NOTES OF THE WEEK

A CURIOUS FORM OF CRYPTOMERIA JAPONICA.

LAST year, on a visit to Boskoop, I saw in the nursery of Mr. C. B. van Nes a strange variety of the Japanese cryptomeria. I knew of several curious forms of this species—for instance, var. araucarioides with slender pendulous branches and short thick falcate leaves resembling those of the Chile pine, Araucaria imbricata; but never had I seen such a monstrous variety, aptly called by Mr. van Nes var. monstrosa. Not all the branches, of course, are transformed in the manner shown in the illustration; but some of the upper branches assume very strange shapes.

This variety can possibly be propagated by grafting. If it should form low compact bushes it would be of great interest for rock gardens. In such places we occasionally find a variety called nana, a densely branched form, with stunted branches and rather long spreading leaves. Var. compacta, too, is a dwarf form, its shorter leaves of a bluish green hue.

The variety elegans has also a dwarf form. The typical elegans represents a readily growing form which has permanently retained the state of the juvenile plant, like the so-called retinospora state of chamæcyparis and several thuyas. This cryptomeria forms dense shrubs or low trees with spreading branches and more or less pendent branchlets. The leaves are softer, narrower and longer than in the type, and somewhat reflexed at the tip. They assume a reddish bronze colour in the autumn and winter, which makes them rather conspicuous. Its form nana is seldom seen, and likes a warm sheltered corner in the rock garden.—CAMILLO SCHNEIDER.

A CURIOUS FORM OF CRYPTOMERIA JAPONICA.

ARISARUM PROBOSCIDEUM.

An Interesting Rock Plant.

ONE of the most singular plants of the garden is Arisarum proboscideum, an aroid of which it may be said with confidence that it is unique in a race noted more for their singularity than for their bright colouring. It is a sister plant of the better known Arisarum europæum, but is exceedingly distinct in appearance. It has been called an eccentric-looking plant, and so it is. It is a dwarf subject which always excites the interest of the visitor to the rock garden, although his attention has usually to be called to this arisarum. It forms masses of small, glossy, arrow-shaped leaves among which appear little, brown, cord-like "tails" and sometimes the broader portion of the flowers. These are a combination of chocolate brown and white, and the hood is lengthened to form the little tail which is easily visible. The latter probably serves the purpose of attracting some insect for fertilising the flowers. Very quaint indeed is this little plant, and it is one of the most interesting, although, also, one of the least showy of the plants of the rock garden.

It grows in walls in Liguria and may be grown in almost any place on rockwork, and it is said that it will even thrive well in a bog, but I have not proved this. It is perfectly hardy.—S. ARNOTT.

THE GIANT FIR.

Abies grandis.

AMONG the many fine species of abies, the so-called great silver fir or giant fir of north-western America seems to be the most rapid grower, not only in its native state but also in Great Britain and in several places of the Continent. The finest specimen I saw years ago in the famous arboretum of the forest school at Les Barres in France. It measured almost 100ft. in height. In the rich bottom lands of the valleys of its native country it is said by Britton to attain a maximum height of 300ft. The specimen illustrated has reached a height of 65ft. in twenty years. It may have been five years old when it was planted. I have never heard before of a fir growing so quickly. It does not grow well in the eastern parts of North America, but, according to Bean, thrives exceedingly well in the moister parts of the British Isles. In cultivation it is sometimes mistaken for another silver fir from Oregon and California, known as A. lasiocarpa in gardens, but apparently representing a good species most closely allied to the Colorado fir, A. concolor. Its correct name is A. Lowiana. It has a similar habit and nearly the same flat, comb-like arrangement of needles as A. grandis, but the latter species has no stomatic lines on the upper surface of the needles. In consequence, the colour of this side of the leaves is dark shining green, while of A. Lowiana the colour is more or less greyish green. The habit of A. grandis is more strictly pyramidal, at least in a plant of over thirty years of age, while younger plants look much alike. Both firs are sometimes recommended for forestry purposes, but, so far as I know, the wood is of no great value.—C. S.

ABIES GRANDIS, SIXTY-FIVE FEET HIGH AND TWENTY-FIVE YEARS OLD.

VIOLA GRACILIS MAJOR.

THIS is a hybrid of V. gracilis, and possesses the good points of the type. It has the same neat, compact growth, but the flowers are larger and somewhat brighter looking. What is particularly welcome, however, is the fact that its flowering period is so much longer than the type.

Plants of mine have been flowering in the greatest profusion ever since the early days of spring and despite the constant rain and wind, have, until quite recently, looked very spic and span with their wiry flower stalks set up well above the foliage. Planted as a groundwork to Inglescombe Yellow tulips they have made a very effective display.—H. H. C.

LILIUM MARTAGON DALMATICUM CATANIÆ.

THE writer has cultivated Lilium Martagon dalmaticum, but, unfortunately, lost it in one of his removals to other homes. He has not yet replaced it, but some years ago became the possessor of the form of that fine lily which is called Cataniæ or (according to Mr. Grove) Cattaneæ, which is a little lighter in colour, though almost approaching the black brown of L. M. dalmaticum. Mr. H. J. Elwes and others have considered that L. M. dalmaticum is a distinct species from L. Martagon, and growing L. Martagon, L. M. album and L. M. dalmaticum Cataniæ in the same garden, one feels strongly inclined to support the view of Mr. Elwes. The feature which is said to distinguish dalmaticum and its form from the other Martagons is the presence of a mass of white hairs on the unopened buds of the two former. This is quite visible on comparison, but, in addition, and from a purely gardening point of view, both dalmaticum and Cataniæ are much more vigorous plants, and grow taller and show some differences quite noticeable to the gardener. Among these is the distance between the whorls of leaves, caused by the greater length of the stem. Cataniæ is quite a noble plant, growing, in some places, almost 8ft. high, though it is less here. It is certainly not a showy plant—no one could expect a flower of its colour to be this—but it is a truly handsome plant with its bold, erect habit, its vigorous foliage and its deep brown flowers. It appears to be of easy cultivation and does not seem to require the partial shade which is so beneficial to L. Martagon and L. M. album. It is growing here in full sun.—DUMFRIES.

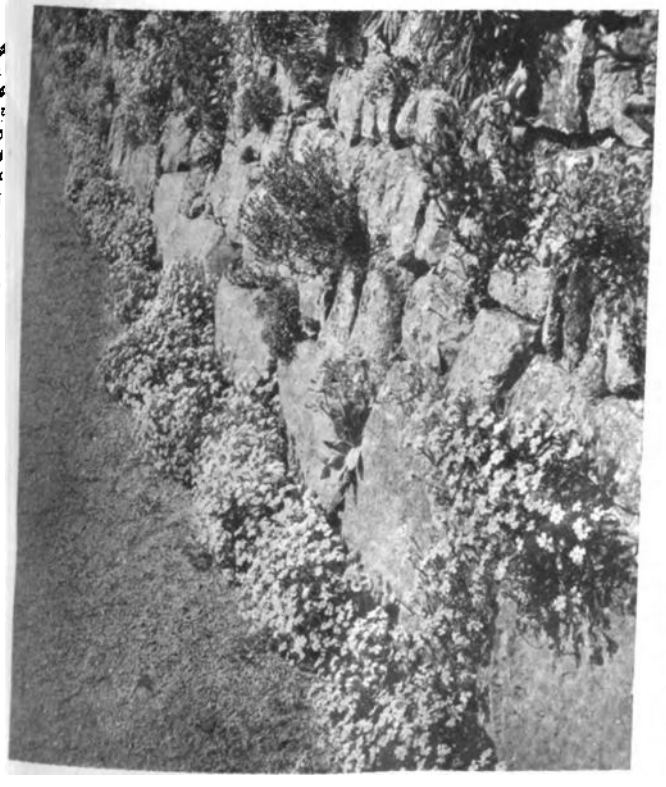
DAY LILIES.

Noble Plants for the Border and Waterside.

IN the hemerocallis we have one of the most prolific blooming of hardy plants that grace the garden with flowers during summer and on into early autumn, and though individual blossoms are of a fugitive character, it makes up for any deficiency in this regard by its daily output. It is contemporary with the flowering of that other plant, so lavish with its blossoms, the helianthemum (sun rose), and renews its beauty day by day in the opening of the new expanding buds. The day lily revels in the sunny quarter of the garden, and does well if planted in soil moderately light with which rotted manure has been incorporated, and also benefits very much by a mulch of old manure just prior to the season of flowering. Loving moisture, it is obvious that if the roots are planted in a sunny position, mulchings of manure will contribute to a prolonging of flowers in a dry period. Very attractive are the day lilies when quartered beside a water course, where the roots can feel the advantage of moisture, in company with irises, spiræas and other water-loving plants. The coolness of a partly shaded border in the garden will also be found a convenience for growing these very charming plants, and it follows that one may have later results. It is perhaps not always appreciated that the hemerocallis gives us flowers noted for their fragrance, as well as variety in colour, and that if they are cut when in a partially open state they will last a day or two in water. H. Dumortieri (orange yellow), H. fulva (copper) and H. flava (yellow) are well known varieties that contribute a deal of beauty in the hardy flower border.—CLAREMONT.

FOR THE OLD WALL.

ONE of the simplest ways of treating an old stone wall is to sow Virginian stock (malcomia) in the crevices. A good plan is to mix the seed with soil and press this into any of the cracks. The little plants sow themselves freely and successive growths of the annual are assured.—S. LEONARD BASTIN *Bournemouth.*



A CHARMING WAY OF TREATING AN OLD STONE WALL IS TO SOW VIRGINIAN STOCK IN THE CREVICES.

DIANTHUS NEGLECTUS.

OF the many species of dianthus or pinks we have in our gardens there is at least one which generally gives abundant satisfaction and unbounded delight when in flower. This is Dianthus neglectus, which, in nature, as in cultivation, varies considerably, so that it is wise to be at some trouble to secure a really good form, although there is hardly one which will not give pleasure. But the best type, not raised from seeds as a rule, is a gem of the first water indeed. It forms a close tuft of grassy foliage, and only an inch or two above this are numbers of delightfully bright flowers of cherry rose, with a blue eye and a reverse of nankin or buff. Seedlings are frequently less compact and often lack the nankin reverse, which is one of the distinguishing features of the best forms of D. neglectus. Very often the inferior forms also bear several blooms on a stalk, while the best plants have usually a solitary flower, but rarely produce two on a stem. In cultivation D. neglectus is not difficult. It is what may be termed a "modified" lime-hater. It does not refuse to grow on calcareous soil, but it is less happy there. It can be grown quite satisfactorily in a border, its stature being only such as to make it suitable for the front row. It is even better on the rock garden on a level spot, while it will thrive well in a moraine, although it is even dwarfer there than in richer soil. It flowers in June and, if happy and the season is suitable, it may also bloom again in autumn. It likes sun. In nature it grows among other dwarf plants or in grass on the higher parts of the Alps; but with us it thrives best alone. Where Dianthus neglectus is happy it will spread into a mat a foot or more across.

DIANTHUS NEGLECTUS IS ONE OF THE MOST SATISFACTORY OF ALL PINKS.

Propagation is effected by cuttings and seeds, but, as already suggested, seedlings vary much, and a good form ought to be increased by cuttings alone.—S. ARNOTT.

THE ERODIUMS.

ONE of the most useful, varied and enchanting of genera for the rock garden is that of erodium. There are quite a number of species, and all are very pretty and fascinating. They are all alike in that they appreciate a warm, sunny position; as to soil, they are not in the least fastidious.

One of the choicest is E. corsicum. This little alpine is but 2½ins. in height, and, although rare, it is not at all difficult to grow. The plant makes a dense cushion-like mass of greyish green foliage. The flowers, which are produced quite freely, are of a rich pink colour and exceedingly dainty. The flowering period is from June to August.

An excellent companion to E. corsicum is E. chamædryoides (syn. Reichardi). This charming little plant is, if anything, even more tiny than the first, being only 2ins. high. The leaves are small, nearly round, and bright green; and the fairy-like flowers are white veined rose. As a matter of fact, although this entrancing little alpine will succeed in a sunny situation, it really requires half-shade. One of the prettiest erodiums is E. Kolbiana. This plant has very effective fern-like foliage and is 6ins. in height The flowers, which are produced freely, are borne in clusters on wiry stems, and are rosy mauve with a dark purple blotch on two of the five petals, the whole being prettily marked with deep rose veins. Altogether E. Kolbiana is a very desirable plant for the rock garden.

E. armenum is very distinct, because of its foliage, the leaves of which are dark green, deeply serrated and somewhat "curly," giving the plant the appearance of a dwarf curly kale. The flowers are white, veined rose, and, as in the previous variety, borne in clusters on 6in. stems.

Digitized by Google

There are many more erodiums well worth growing, but reference must be made here to E. guttatum. Despite its rather ugly name, this particular heron's-bill is very dainty. In habit it is practically identical with E. Kolbiana, but the flowers are white, veined rose, with two dark blotches; this combination somewhat resembles a most beautiful miniature fancy pelargonium.—JOHN BIRKENTALL.

GLYPTOSTROBUS HETEROPHYLLUS.

The Swamp Cypress of China.

ON March 16th Professor A. Henry read a paper before the Royal Irish Academy on this interesting tree. It is a near relative of the well known swamp cypress of the south-eastern United States, Taxodium distichum, but is, and always has been, a rare plant in cultivation in this country. One reason for this is that it has never been introduced in any quantity; another is that it is too tender to be grown out of doors in any but the mildest parts of our islands. According to Professor Henry, it has, like the maidenhair tree, died out in a wild state and is now only known in China as a cultivated tree in two restricted localities around Canton and Foochow. The Chinese peasants plant it on the north side of their villages to bring luck, also in the rice fields in the belief that it increases the crop. Like the maidenhair tree, too, it is the survivor of an ancient type of vegetation which, at an earlier stage of the earth's history, was widely spread over the northern hemisphere. Professor Henry notes that fossil remains have been discovered in northern Europe, Asia and America, and that fossilised twigs and leaves have been found in the Eocene beds in the Isle of Mull. As seen in the Chinese rice fields it resembles the taxodium in producing woody upgrowths from the roots (commonly called "knees"), which stand out of the ground 1ft. to 2ft. high. The purpose served by these "knees" has been considered doubtful, but Professor Henry observes that they enable the roots to breathe when inundated. They are produced in considerable quantity by the famous example of taxodium growing on the banks of the lake at Sion, but, judging by a tree growing in the lily pond at Kew, the species seems very well able to succeed without them. Before the lily pond was made, about thirty years ago, this tree was growing at the bottom of a dry hollow; when this was filled with water the base of the trunk became suddenly immersed to a depth of about 3ft. Although it has been uninterruptedly in this condition for thirty years, it has grown well and been in perfect health all the time, yet no "knees" are visible.

Young trees of the glyptostrobus are very similar to those of the taxodium in the foliage. The leaves are rather longer, but are arranged in the same two opposite rows, being brought into this position by a twisting of the base of the very short stalks. As the plants get older the leaves are set in three rows; finally, in the adult and cone-bearing state, they become reduced to closely imbricated scales.

As a cultivated plant the glyptostrobus is chiefly to be valued for the beautiful autumn tints of its dying foliage. This turns a soft, rich red and, grown under glass as it is at Kew, persists on the shoots in this, colour for six or eight weeks. Out of doors no doubt, with wind and rain to contend against, its season of beauty would be shorter.

Professor Henry, who has been interested in this tree for a long time, managed to obtain seed of it from China. From this, young plants have been raised, so the species will not be quite so rare as hitherto.—W. J. B.

CORRESPONDENCE

VERBASCUM PHŒNICEUM.

SIR,—In his note upon this desirable mullein, Mr. Day (page 374), surprises me by saying that it "rarely gives satisfaction after the first flowering season," and recommends that it be treated as an annual or biennial. This is completely at variance with our experience here, where many plants with flowers varying from deep purple to pink and white, have been established for a number of years and never fail to send up fine spikes of bloom. I have just now measured a flowering stem on a plant which is certainly ten years old, probably more, and find it stands 4ft. 5ins. high. The soil in which our plants flourish as true perennials is sharp, gravelly loam, free from lime.—HERBERT MAXWELL, *Monreith*.

SENECIO GLASTINIFOLIUS.

SIR.—In the report on the Chelsea Show published in THE GARDEN on June 5th, favourable comment is made regarding this plant as shown by one of the exhibitors.

Although infrequently seen in gardens, it was introduced from South Africa as long ago as 1826 under the name of S. lilacinus. It is sometimes cultivated and shown under the name of S. multibracteatus. This latter plant is, however, really a distinct species, being introduced from South Africa in 1872. S. multibracteatus is an annual and does not appear to be in cultivation.

Senecio glastinifolius is an exceedingly elegant plant, bearing a profusion of pretty pink cineraria-like flowers on rather long wiry stems. It may be raised from seeds or cuttings, the latter method being preferable.

The cuttings may be inserted in pans of sandy soil in August or September and placed in a propagating case until rooted, when they may be transferred to cooler quarters. As soon as sufficient roots have formed they will require potting singly into small sixties, using a rather light compost and making moderately firm. About a week after this potting the tops should be pinched out to induce a bushy growth. During the winter they should be kept on a shelf near the glass in a house with a minimum temperature of 40° to 45° Fahr.

With the advent of the New Year growth will commence again and the shoots will require pinching when about 4ins. long, and the plants transferring to 4in. pots.

The plants should be grown in a cool, light position, and in early March repotted into 6in. pots, this time using a fairly rich compost. Keep the plants neatly staked and tied, and when the pots are full of roots, feeding with weak manure water, soot water and a little Clay's Fertiliser occasionally will prove beneficial, and an abundant display of bloom will result towards the end of May.

Good plants for flowering in 4in. and 5in. pots are obtained from cuttings inserted in January and February and treated in a similar manner to the autumn-struck material.

After flowering, the flower stems should be cut off and the larger plants top-dressed and those in smaller pots potted on and grown on in cold frames. By this means a second show of bloom is obtained in early August. In addition to being of easy cultivation and exceedingly useful for conservatory and house decoration, the flowers last well in water and are useful for table work.

It may also be successfully used for bedding out during the summer months.—T. H. EVERETT.

THE PACKING OF PLANTS.

SIR,—Your invitation for contributions likely to be of interest to THE GARDEN readers is my excuse for this short note.

Local horticulturists look to England for horticultural treasures. The writer imports quite a large number of plants, bulbs, etc., from England, also from France, Holland, America and Australia, and at various times forwards quite a lot of small native shrubs to friends in England.

Now I find the most desirable things procurable from England are difficult to land in New Zealand in anything like a satisfactory condition. Plants sent from Australia to New Zealand, from America to New Zealand and from Holland arrived here in a perfect condition; but, we are sorry to say, quite a number of the plants and bulbs from England have arrived in a state of pulp.

With the cool storage for the carriage of plants at the disposal of shippers, I think there should be no difficulty. The plants should reach us in perfect condition. Plants that have come through as ordinary cargo from Holland have reached us in perfect order, due, possibly, to the fact that the butcher in charge of these plants occasionally gave them a good watering.

Some pinks we received by the last mail from England were packed in an ordinary box without due regard to ventilation and were forwarded per parcel post; needless to say, they reached us as dry as dust, and absolutely useless. If bulbous plants are intended to be forwarded, we suggest that they be selected, and examined and certified by the horticultural inspectors as being free from disease (full certificates must accompany each parcel), and then packed in small cardboard boxes that are well ventilated; the plants should be surrounded with buck wheat husk or charcoal, and posted so as to connect with the Vancouver or San Francisco mail. If plants such as carnations, pinks, delphiniums, asters, etc., are sent forward, we respectfully suggest well established plants in at least 4in. pots to be planted in a layer of sphagnum moss and surrounded with sphagnum moss to within ½in. of the top of the pots, and a batten placed over the top of the pots so that there is no fear of them being upset in transit. If these are placed in the cool chamber of one of the steamers that trade regularly with New Zealand, and are carried at a temperature of 45°, they will reach their destination in good condition, provided that the plants have a free current of air passing overhead. A number of those who ship plants from England seem to forget that it is necessary for plants to breathe; they pack them in an airtight box and poison the plants with their own oxygen, and, consequently, plants invariably arrive in a useless condition. We must congratulate some of the English horticulturists who are now forwarding their various novelties to New Zealand so that there is a prospect of them reaching their destination in a reasonably good condition. We particularly ask those who intend catering for the colonial trade to take special care of this branch of industry, that is, the successful packing and despatching of rare plants and bulbs. The most important (to the writer's way of thinking) is that all bulbs and plants should be lifted and despatched at the commencement of their dormant season: that is, narcissi, tulips, etc., as soon as the foliage dies back; delphiniums, asters, carnations, pinks, etc., as soon after flowering as possible, so that the change will not be noticeable, and then

Digitized by Google

place them in cool storage, when they will go into their natural resting period without the slightest inconvenience.—E. OSWALD REILLY, *Dunedin, New Zealand.*

DEAN HOLE AND HIS ROSES.

SIR,—Two writers on roses, recently, Mr. Linders Lea and Mr. Wettern, have both quoted Dean Hole's paragraph giving Gloire de Dijon as his last choice, but the Dean chose another favourite in his later years. There was a very interesting article from his pen in *Country Life* many years ago, headed, "Where are the Friends of My Youth?" and dealing with old roses that were clearly replaced by better new ones of similar colour and he finished by saying, if compelled to choose one rose and one only, he would bury his face in a full blown bloom of La France.—J. P., *Cheltenham.*

ANOPTERUS GLANDULOSUS.

SIR,—It is stated in a recent issue of THE GARDEN that this beautiful plant has never been much cultivated. While that may apply to the present generation of gardeners, I believe I am correct in saying that it was at one time grown as a market plant. That is going back to the days when really interesting collections of cool greenhouse plants were common in most good gardens, including as they did many beautiful plants from Australia, as well as heaths and bulbous plants from South Africa.

This plant only requires a cool greenhouse during all stages of its cultivation, and is easily propagated by means of cuttings of the half-ripened shoots, inserted in pots of sandy loam or sand and peat, standing the pots under a bell-glass in a cool greenhouse.

If grown in pots it requires ample root room, and plenty of water at the root. It is probably seen at its best when planted out in a cool greenhouse. It is hardy outdoors in Cornwall, and should succeed outdoors in other favoured parts of the country.

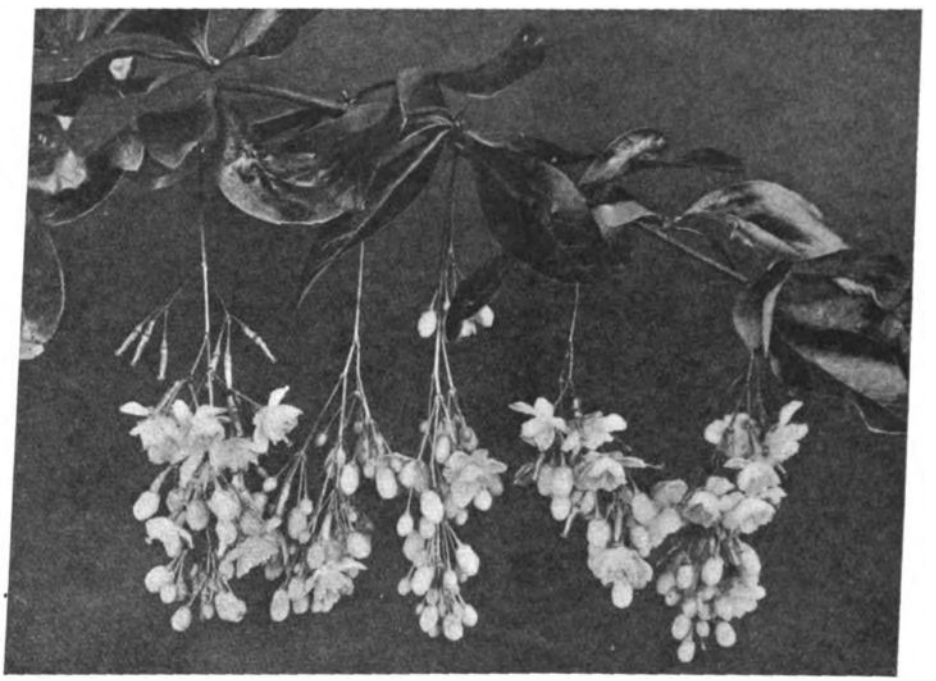
Platytheca galioides, known at one time as Tetratheca, also as Tremandra verticillata, is another beautiful plant which is practically unknown to present-day gardeners, and yet this plant was at one time grown for market. It is a native of south-west Australia, and was introduced in 1845. It is a very graceful, slender-growing, cool greenhouse plant, which in its season bears in great profusion its beautiful blue flowers. It succeeds best in a compost of sandy peat, and is propagated by means of cuttings inserted in pots of fine sandy peat and stood under a bell-glass in a cool house.

In its young stages it requires frequent pinching to induce a bushy habit. After flowering, the long slender shoots should be cut back. Careful watering is essential at all times.—J. COUTTS.

BERBERIS CHITRIA.

SIR,—In his very interesting article on some species of berberis, which appeared in THE GARDEN of May 1st last, Dr. Schneider recalls having seen a particularly fine specimen of Berberis chitria at Wisley. The plant in question is again flowering, although less profusely than on that occasion and I am sending a photograph of a single spray which conveys some idea of its beauty. This plant fruits freely, but the berries are small and of a rather dull red colour. Few of them contain fertile seeds.

The figure to which Dr. Schneider refers (Bot. Reg. t. 729, 1823), depicts a plant with coarsely toothed leaves. With the exception of the strongest young growths, the Wisley plant bears much more finely toothed leaves and the smaller ones are frequently entire. Dr. Schneider also speaks of this as a deciduous species. Here it is sub-evergreen, many of the leaves remaining on the shoots throughout the second season.—N. K. GOULD, *Wisley.*



A FLOWERING SPRAY OF BERBERIS CHITRIA.

THE FLOWER GARDEN

SWEET PEAS.

Prolonging Their Flowering Period.

FEW, if any, other flowers are capable of furnishing such a vast quantity of blooms in the summer and autumn as sweet peas, yet a little care is necessary in order to extend the period during which really good spikes may be cut. Given almost any conditions, our sweet peas will provide a generous supply of blooms, but under favourable circumstances upwards of 400 spikes are possible from a single plant. How may we achieve quality as well as quantity and maintain size of flower and a good length of stem throughout the season and not just at the outset.

Quantity is assured by the simple method of regularly removing all flowers and allowing no seed pods to form. The normal function of the plant is to produce seed, and as soon as pods have formed its mission is accomplished. So long as this is frustrated, and provided our sweet peas have not been planted too closely, they will continue to grow vigorously and produce flowers until the weather, or other conditions, call a halt.

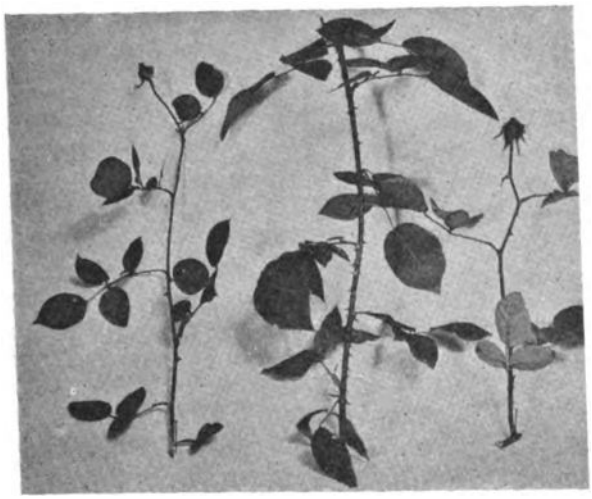
Good quality blooms are not quite as easily attained. One must assume in the first place that the soil has been deeply and liberally prepared, for this is essential. Plants which have been moved from pots or boxes, especially spring-sown ones, are liable to come into flower when they are quite small. This gives the root system no chance to develop properly. All flower-buds should be nipped out until the plants are about 3ft. high; early blooms may be very desirable, but it is better to disbud than jeopardise the future of the plants. In a normal season there is no necessity to commence watering before July. During dry weather the moisture in the soil may be conserved either by frequent shallow hoeings or by a surface mulch of decayed manure, spent hops, peat litter or horse or cow manure mixed with leaf-mould spread round the plants about the second or third week in June. Any mulch will do provided it is of a loose, porous nature which will permit the free circulation of air. Mulching is always beneficial except on heavy soil during a wet summer. It is wise to defer watering until the plants really need it, and the grower must be guided by soil and weather conditions in this respect. A good soaking once every week is better than a sprinkling every day, and the former will be found sufficient except on light soils during a dry period, when intervals of two days between each application will not be too close. On the other hand, in cold weather, especially on heavy soils or on ground with a tendency to become waterlogged, frequent waterings may do a great deal of harm and result in a spell of bud-dropping. On no account use icy-cold water straight from a tap or well; if soft water is not available in sufficient quantity, take the chill off by allowing it to stand for a day or two in the open.

With respect to feeding, the main source of nutriment should be provided the previous autumn during the preparation of the soil by incorporating plenty of animal manure and, if possible, a fair dressing of bone meal and wood ashes. Fertilisers applied during the flowering period should be regarded as stimulants purely and simply, and should be soluble, quick-acting and easily assimilated. Inexperienced growers should be careful not to give over-doses of chemical fertilisers. A safe stimulant is the old-fashioned liquid manure made by immersing a bag of cow or sheep manure and soot in a tub of water, letting it stand for a few days and then diluting the resultant fluid at the rate of one part to four with soft water when applying it. Feeding once a week

Digitized by Google

will be ample after mid-July, with an occasional watering in between times during very dry weather. By way of a change in diet one may use artificial fertilisers now and again. There are several good compound manures on the market, specially made up to meet the particular needs of sweet peas. The makers' directions should be strictly followed.

Should the flower-stems shorten considerably as the season advances in spite of watering, the only remedy likely to be effective is to take off all flowers and flower-buds and feed the plants.—C. H. A. S.



ROSE CUTTINGS PREPARED FOR INSERTION.

ROSE CUTTINGS LAID OUT IN AN OPEN TRENCH.

CAMPANULA PERSICIFOLIA.

I HAVE been very pleased this season with plants of several of the newer varieties of Campanula persicifolia. The plants were put in during the spring of 1925 and have been left undisturbed. All the varieties tried represent a very considerable advance on the type, not only with regard to the colour, but also with regard to the general appearance and growth of the plants. The various tones of colour range from pale blue to bluish violet, as well as pure white.

The individual plants have grown away very strongly and in each case have put forth a number of stately spikes some 4ft. or so in height, bearing their pretty bell-shaped flowers in the greatest profusion. The separate varieties are very effective when massed.

The plants will do well in shady or semi-shady positions. They are no trouble in their culture and are easily propagated by division. In fact, where the soil is rich, division after the third season may be in the best interests of the flower display.

A few of the finest varieties are: Everest, a tall growing sort bearing flowers of a light blue colour and producing a number of lateral spikes; Fleur de Niege, a very fine variety with double flowers of the purest white; Monarch, another double-flowered sort with large blooms of mauve blue colour; Queen of June, a variety of branching habit bearing flowers of a china blue tone in the greatest profusion; Telham Beauty, a very excellent kind of somewhat dwarfer habit than any of the foregoing and bearing very large bells of pale blue colour.—HOWARD H. CRANE.

ROSES.

Propagation by Cuttings. A VERY satisfactory way of propagating roses is by means of cuttings. If reasonable care is taken a large percentage of the shoots will root and rapidly develop. By far the best time to carry out this plan is in the latter half of July. Choose a somewhat shaded border and let the soil be well dug; finish by raking the surface finely. Select the cuttings from half-ripened wood, and these may be 4ins. or 5ins. long. If they can be pulled away from the stem with what gardeners know as a "heel," so much the better. Expose the cuttings as little as possible to the sun and air, and, if they have to be gathered some time in advance of setting, keep them protected with damp moss. It is best to remove all the lower leaves, and when the cutting does not possess a "heel" make a clean slanting cut with a knife just below the bottom bud.

Open up a trench in the ground of sufficient depth to leave the leafy part of the cuttings well clear of the soil. Let the side of the trench farthest from you be almost upright, and trench, against this side, rest the cuttings about 4ins. apart. When the row is filled put the soil against the cuttings, fill in the trench, and then tread with the foot. It is very important to see that the soil is firmly pressed round each cutting, as roses never root well if they are loosely set. Examine the cuttings now and again and remove any withered leaves. During a dry spell water must be given freely. In about six weeks some of the cuttings will have rooted, and, when there are definite signs of growth, the plants can be removed to other positions.

This plan yields excellent results in the case of all the hardy and vigorous roses. Roses that are more delicate in constitution give the best results if the cuttings are inserted in a slight hot-bed. A bed that has been used for propagating bedding or other stock in the spring answers the purpose admirably. Here, again, it is an advantage to have the cuttings with a "heel." The frame must be kept rather close and shaded. If the soil is fairly retentive of moisture, little in the way of water will be needed. Remove all decaying foliage and also any of the cuttings that show definite signs of going wrong. Where it can be obtained, coco-fibre refuse, in a partial state of decomposition, is an excellent medium for the rooting of cuttings in a frame or in pots. This retains just the right degree of moisture which will keep the cuttings going without any further watering. As soon as the cuttings have made an inch or so of root growth they should be allowed to develop under more airy conditions.—S. LEONARD BASTIN.

FUCHSIAS—BUD-DROPPING.

IT is somewhat irritating to find that fuchsias which have promised well, suddenly drop their buds when one expected flowers to open. This may be traced to various causes, either a too stuffy atmosphere and great lack of ventilation, over-watering, over-dryness, or a need for repotting. Unfortunately the damage is often done before one can rectify matters, and the buds cease to swell and drop off. The commonest cause of failure is through lack of air and this is sometimes noticed with plants in living-rooms, brought in from the greenhouse, or those placed in a sitting-room window. Air is needful for fuchsias, along with cool conditions. Old plants that for years possibly may have been in the same pots are more liable to collapse than younger, because of the soil having become used up to a great extent and the roots matted and congested. One can do little when such a state of things exists beyond careful watering, administering weak stimulants, and carefully shading the plants after the bud stage has been reached, and, above all, in admitting air, both by day and night. With no plant is it more desirable to strike the happy medium in the matter of water than the fuchsia, and one of the secrets of cultivating them successfully is to keep moving the plants on until the desired size of pot is reached. It has become the fashion to limit fuchsias to pots of moderate size, because of their adaptability for table and window decoration, and seldom to-day do we meet with the 6ft. specimens that used to be exhibited thirty and more years ago.—W. LINDERS. LEA.

ARUM LILIES.

THE arum lily is an indispensable plant in every garden where there is a greenhouse or conservatory. Well managed plants will yield flowers from late in August to Eastertime. One strong plant, established in a 6in. pot will bear four flowers in the period named; occasionally, a single plant bears five blooms, but the average yield is three flowers. During the growing stage the plants are, generally, well looked after, but, unfortunately, they are often neglected when the flowering stage is past. It is a very accommodating plant, answering to dry treatment from June to August, or to that which keeps them growing practically all the year round.

The inexperienced amateur should retain the plants in their flowering pots, gradually withholding water and so allowing the foliage to die down as it will by mid-July. About the middle of August the pots should be placed in an upright position and the soil watered. In a very short time new growth will begin and at this stage it is beneficial to re-pot the plants. To do this, turn them out, practically remove all soil from the roots, also any side shoots and re-pot in a similar sized pot, using good

Digitized by Google

fibrous loam and a small proportion of leaf-soil. The small shoots pot up into small pots separately. Apply water, keep the plants outside on a bed of ashes for several weeks, then transfer them to a cold frame and later, in late September, to the greenhouse.

Where large batches of plants are grown, it is advisable to retain some in their flowering pots, but gradually dried off, to top-dress only and place in a warm structure in August to ensure blooms early. The other batch treat as first advised in this note, and the remainder plant out in the open borders in the vegetable garden, watering and feeding them throughout the summer. These plants are lifted, divided and re-potted about the third week in August. The arum lily must not be subjected to frosts nor to very cold weather while growth is active, else the plants will be rendered practically useless.—HANTS.

FRUIT AND VEGETABLES

MORELLO CHERRIES.

Tying-in Summer Growths.

IN many districts morello cherries on walls are this year bearing good crops and making considerable wood growth. It must be remembered that morello cherries bear their fruit on the previous summer's growth, so that the new wood should not be summer pruned in the same way as the shoots of the apple. The chief object during the summer months is to retain suitably placed new growths for tying in during the winter, and to cut clean out young growths which are unwanted. No spurring should be done. The new wood which is left should be tied back loosely to the trellis, and then in the winter some of the old wood is cut out, and in its place these young growths are trained in symmetrically in a fan-shaped fashion. During dry weather an occasional thorough soaking of water should be given to morello cherries, as the ground at the base of a wall is liable to become very dry.

RASPBERRIES.

How to Obtain this Fruit in the Autumn.

FEW fruits are more welcome in the autumn than raspberries, and it is rather surprising that more growers do not try to secure an autumn crop. Of course, there are definite autumn-bearing varieties of raspberry, but practically all the kinds in cultivation have a tendency towards the production of a second crop, and, in most cases, the canes will give a good response in this direction if encouraged to do so. The chances of getting the autumn fruit are much enhanced if the raspberries are growing on a warm, dry site where the soil is on the light side, but deep, and generally in good condition.

Here is the way to proceed in order to induce autumn-bearing on the part of raspberries. After the summer crop is cleared, select a number of the stoutest canes and cut these back to about half their height. At the same time, a reasonable thinning out of the young canes should be carried out. This is good for the plants as a whole, and it also allows free access of light and air to those canes which have been set aside for second cropping. Almost at once the shortened canes start a vigorous growth from the sides. The appearance of leafy shoots is rapidly followed by the production of flower buds. At this stage a top-dressing of manure will prove highly beneficial, especially if the late summer is hot and dry. This top-dressing may be lightly forked in, but the soil should never be stirred to any depth, otherwise there is a risk that many of the surface roots will be destroyed. Where it is not convenient to apply the top-dressings, applications of liquid manure will prove highly beneficial. Even plain water is not to be despised, although during rainy spells this will, naturally, not be needed. The autumn raspberries set well and, as a rule, are quite as fine, and sometimes larger, than those produced in the summer. Even if the crop as a whole is not heavy, it is often spread over a long time. A good deal, of course, depends on the weather; but in a favourable season the writer has gathered dishes of autumn raspberries, from canes that had already borne a summer crop, up to the first week in November.—S. LEONARD BASTIN.

TURNIPS.

How to Secure Late Supplies.

BY sowing certain varieties of turnips at frequent intervals from now until the middle of August a supply of this vegetable can be maintained until the end of the year. It is a common fault to sow turnip seed too thickly and to sow too much at once. Small sowings are far more profitable. Sow the seed drills about 12ins. apart, and as soon as the seedlings are large enough thin out to 4ins. to 6ins. apart, if possible choosing showery weather for the latter operation. Hoe between the rows frequently, as this keeps down weeds and encourages the plants to make good growth. Snowball is one of the best varieties for late supplies, while Red Globe is another good variety which is somewhat hardier than the former and takes a little longer to mature. Veitch's Red Globe is also suitable for this purpose.

SUMMER SALADS.

DURING the hot, dry months of summer it is essential that a shady, cool, north border be chosen for the site in which to grow salads. An exposed, hot situation will not produce quick and tender growth; lettuces in such a position are coarse and rank, and form no heart, while radishes are pithy and run to top growth. The ground should be moist and fairly rich, and, if possible, a site should be selected which has been well manured during the early part of the year. Sow the seed very sparsely, thin early and do not transplant. Transplanting at this time of the year checks growth and in the case of lettuces causes the roots to bleed and ultimately the plants to "bolt." If the ground be very dry, water the drills thoroughly before sowing, but after that give no water until the seedlings are through the ground.

THE EPICURE POTATO IN SCOTLAND.

EPICURE is by no means an ideal potato. Its appearance is rather poor, the quality is not of very high merit and, in most other points, it is inclined to be weak. For early maturity, however, and for reliability in the early part of the year it is without real rival; the crop is a fairly large one as a rule in all parts.

Earliest crops are raised in sandy loams round the coast; inland, in heavy soils, but well worked, it crops even better, but growth is slower and maturity delayed. This year the first supplies reached Glasgow shortly after mid-May; on June 1st they were retailing quite freely everywhere in the Glasgow district at 3s. a stone, and in July they will be universal at little more than the price of old potatoes.

Moderate dressings of natural manure (farm manure and seaweed on coastal farms) with fair additions of stimulating artificial fertilisers rich in potash and ammonia seem to give best results. This potato is a first favourite until August.—CLYDESDALE.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty	Pale rose and deep red.
Lohengrin	Cattleya mauve.
Mdm. Chereau	White, frilled azure blue.
Mrs. H. Darwin	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme	Pure blue and blue purple.
Prosper Laugier	Bronzy cinnamon and velvety crimson.
Rhein Nixe	White and violet purple.

One plant each of the 12 varieties, **7/6** post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

SAFETY FIRST

THE fruit grower knows scientific spraying will protect his fruit trees from the ravages of sucking insects. He knows, too, that failure to get rid of them means gambling on the prospects of securing crops of clean, sound fruit.

TAKE NO RISKS.

Spray your trees now with

COOPER'S

Summer Spray Fluid

The fluid is fatal to all sucking insects and, used in accordance with directions, will cause no damage to foliage or fruit.

½-pint	2/-	½-gallon	9/-
1 pint	3.6	1 gallon	14/-
Quart	5.6	2 gallons	26/-

1 gallon makes 100 gallons of spray.

Of all Agents.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE FLOWER GARDEN.

Border Carnations.—To keep up a healthy stock of carnations, it is necessary to raise a number of fresh plants each year, and with named and special varieties layering of the growths must be resorted to. Such work is carried out directly the flowering period is over. When layering, first remove 2ins. or 3ins. of the top soil around the base of the plant and replace it with gritty compost. Partly sever the young shoots, and peg them down in the fresh soil where they will soon form roots.

Heucheras.—These constitute a small group of showy plants for the border, or certain parts of the rock garden. Having finished flowering, the plants can be lifted, pulled to pieces, and the single growths set out in a cold frame or partly shaded border. Here they make fine examples for next year.

Geums.—No lover of flowers can afford to be without the beautiful double geums, such as the red Mrs. Bradshaw, the golden yellow Lady Stratheden and Orange King. Seeds can now be sown in the open ground, choosing a moist, partially shaded spot. Prick out the seedlings when large enough a few inches apart, and transfer them to their flowering quarters in the spring.

Lilium candidum.—The Madonna lily is a beautiful old-world border subject and is very effective in bold clumps. In time they become overcrowded, and when such is the case they must be lifted, divided and replanted immediately after flowering. Deep planting is not advised, and the bulbs should be 4ins. or 6ins. apart. Bulbs offered in winter and spring take much longer to become established.

THE ROCK GARDEN.

About this time we prepare a cold frame for propagating a large number of plants for the rock garden. It is set on a hard bottom, then place about 6ins. of rough material for drainage, over which is laid another 6ins. of sifted peat, loam and leaf-mould with a thin layer of sharp sand on top. Give a good watering, and everything will be ready for the cuttings.

A variety of subjects can be increased by means of cuttings, and these should be made from half-ripened shoots. Little shade or ventilation is needed where it is possible to spray the cuttings with rain-water three or four times daily. Under such conditions they will readily form roots, when more air can be gradually admitted. If it is not possible to maintain such humidity, a little extra shade will be needed. A large number of shrubs can also be increased by cuttings, either in the open ground or on a mild hot-bed.

THE HARDY FRUIT GARDEN.

The summer pruning of apple trees can begin during the next few days, starting with any that may be growing against walls, and then follow on with pyramids and bushes. Standards need not be pruned unless there are a few shoots growing freely, at the expense of other growths. Opinions differ in regard to summer pruning, but by cutting away some of the shoots more light and air are admitted to the fruit and tree; and if five or six leaves are allowed to remain at the base of each growth there is little likelihood of the basal buds becoming unduly active. The ripening of the wood is also assisted.

Care must be taken of the new growths of loganberries and all the blackberry tribe where they are trained to poles, fences, trellises and other supports. The shoots should be tied up out of harm's way; at the same time, do not cover the fruit. It is a temporary measure until the fruit is gathered and the old fruiting canes removed.

THE KITCHEN GARDEN.

Spring Cabbages are a very important crop, and if this failed we should be rather short of vegetables about April and May. Two or three sowings are, therefore, advised: the first now, the third at the middle of August, and the second a fortnight hence. Ellam's Early, April and Imperial are a trio of useful and reliable varieties. Sow in lines 1ft. apart, and if the ground is dry well water the drills a few hours before sowing. Another sowing of turnips should be made, also lettuce, endive and spinach beet to stand the winter. Directly early peas and broad beans are finished they must be removed, and after cleaning the ground of surface weeds it can be filled with winter greens, etc. A few lines of wallflowers may also be put out; they will make strong plants for the beds in the autumn. Continue with the hoe, and afford water to early cauliflowers and celery if the weather proves dry. Early potatoes may be lifted and stored.

FRUIT UNDER GLASS.

Peaches and Nectarines.—The trees in the earlier houses will have been relieved of their crops, and now a little pruning can be done so that the remaining wood will be fully exposed to the light. Remove as much of the old fruiting wood as possible, but it should be borne in mind that the final pruning, and distribution of young shoots over the wires, will take place after the leaves have fallen. In the meantime, cleanse the trees of red spider and scale insects if they are present; the former is eradicated by hard syringing, first with an insecticide and afterwards daily with clear water; the latter is usually found on the older wood and, in consequence, a stronger solution of insecticide can be employed. This is best applied with a fairly stiff sash tool. A nicotine insecticide is very reliable, if used according to the instructions. Admit all the air possible both day and night, and see that the roots are kept moist. To this end a light mulch of manure can be given: it will keep the surface damp, the roots active, and, moreover, prevent cracks appearing in the border. Trees must never be neglected after the fruit is gathered, otherwise bud-dropping and other evils will present themselves next season.

In the houses that were started into growth about March, the fruits have now passed the stoning period and commenced their final swelling. Keep the border just moist and afford liquid manure or a light dressing of fertiliser, the latter being washed in with clear water. A mulch of partly decayed manure will also be beneficial, except for trees making a lot of luxuriant growth, which need no manurial assistance. During bright weather and until the fruit begins to colour, the trees should be syringed twice daily, *viz.*, early in the morning—say about 8 a.m.—and again in the afternoon. On dull mornings omit the spraying, and the later one must be done sufficiently early for the fruit to dry before sunset. If water is allowed to remain on the fruit throughout the night, the skin of the fruits will sometimes crack, while the flavour will deteriorate. Early ventilation is advised, before the temperature rises to 70° or 80° Fahr., and an inch or so can be left on throughout the night. A few early varieties are occasionally grown in pots, and when the fruit is picked the trees are removed to a sheltered spot outside, plunging the receptacles to their rims. Syringe the foliage daily, and pay special attention to watering, to prevent dryness at the root.

Cucumbers.—These need frequent attention, and it is advisable to examine the plants twice each week, whether they are growing in frames or a low greenhouse. Pinch the growths after the second leaf, and prevent overcrowding by removing shoots that have ceased to bear fruit. Keep the roots well supplied with water, or the fruits will be bitter to the taste. Mildew is often a source of anxiety to the amateur; if this is very bad, remove the leaves most affected, and apply flowers of sulphur through a small bellows or distributor to the remainder of the plant.

Tomatoes.—Plants growing under glass are fruiting freely, and plenty of ventilation will be needed; in fact, the top ventilators can be left open both day and night. Top-dress the roots with fibrous loam, and where this is not possible they should be fed with liquid manure and soot water, about twice each week. All side growths are removed, the main stem made secure to stakes, and the bunches of fruit fully exposed to the light by cutting away an occasional leaf where necessary; otherwise, no foliage is taken off. White fly is often troublesome, and the only remedy is to use one of the special fumigants.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE KITCHEN GARDEN.

Shallots.—Lift these when the foliage changes colour, and spread them out or hang them up in the sun to ripen. A section of close-meshed wire netting suspended on four stakes suits admirably. The better they are dried and ripened the longer and better will they keep. If maturation be delayed by inclement weather, remove the soil around the clumps, to expose the bulbs and hasten ripening.

Early Potatoes for seed should be lifted before being ripe, exposed to the light until they become green, afterwards storing in a semi-obscure place. It is claimed that immature seed are more productive than fully ripened ones. Early lifting allows the ground to be efficiently prepared and the succeeding crop planted sooner. These crops are at the discretion of the cultivator, and may be small cabbages of colewort type for late cutting, or a successional batch of leeks, etc. But in a general way the early potato crop is followed by the new plantation of strawberries.

Spinach.—Make a sowing of perpetual spinach or spinach beet as an accessory to the winter spinach, the supplies of which, through a hard winter, may fall short of the demand. When ready for picking, remove the leaves, whether wanted or not, to promote a continuous growth.

Onions.—Towards the end of the month make a final sowing of onions. Prick off the thinnings from the earlier sowing 1ft. to 15ins. apart, according to variety used. Leave a crop to mature on the seed bed, as such gives the earliest and choicest supplies when properly blanched.

Asparagus will now be making good growth, and as broken stems mean loss of service of top growths in maturing heads for the following year, protection against this loss should be given in exposed situations. Dust with slaked lime or spray with warm water against asparagus beetle.

THE FRUIT GARDEN.

The most important task is the summer pruning of plum trees on walls. For appearance sake this is often done too early, and the trees make a secondary growth which is all against the main principles underlying the work. Other benefits derived from the operation is the exposure of the fruit to the light, the riddance of many aphis not easily reached by a spray. A spraying of paraffin emulsion will complete this care after pruning is finished.

WORK IN THE FLOWER GARDEN.

Herein, the principal items, apart from maintaining cleanliness, hoeing, and watering if needful, is that of ensuring efficient support for the tall-growing subjects. Specimen plants, such as fuchsias, etc., are permanently staked when planted. The tall varieties of antirrhinums, at least, should have a stake supporting the main shoot. In my own case I like to make sure now, rather than be sorry afterwards, and give the intermediate a short stake as well.

Pentstemons grown under the best principles for bedding out are pinched in their early days. The numerous side shoots are now best supported by introducing short twiggy spruce branches, the remains of spent brooms, throughout the bed. Larkspurs, marigolds, etc., when growing well, reach a goodly height and are more self-supporting than other things equally as tall. Yet security of tenure is assured by tying to a short, stout stake. In such an important matter as staking, we may be excused if we reiterate how essential it is to support the plants without making the work obvious.

Sweet Peas growing as single or double cordons to supply cut flowers with useful long and stout stems will need frequent attention as to pinching out side growths and tying the points of the leaders. As the blooms are not for exhibition purposes an elaborate "scheme of feeding" is not necessary. Nevertheless, moderate applications of potassic and phosphatic manures will benefit stem growth and improve the quality of the flowers.

Border Carnations.—To allow of the layers being properly rooted and planted out before winter sets in, proceed with the layering forthwith. The usual method of procedure is to prick the soil lightly around the plant, push it aside and substitute a mixture of leaf-mould and sand. Denude the layers of a few bottom leaves, make an incision on the underside and upwards through a couple of joints, and peg down the layer into the fresh soil, seeing to it that the "tongue" is kept open. Use wire pegs or—quite as good—pegs formed from the joints of bracken fern. Return the original soil and the work is less likely to be disturbed by birds or "drying out" in hot weather.

Doune, Perthshire. W. MCCARRELL.

MISCELLANEOUS NOTES

WASPS.

AS the summer advances wasps are likely to become an increasing trouble to the fruit grower. When these insects are abundant they are likely to do a great deal of damage to pears, plums and, in fact, any sweet and comparatively soft fruits. Wasps are not contented with making an attack on a few fruits and they often damage dozens; unfortunately, they seem to have great discerning powers in picking out those fruits which are the finest on the tree. To protect the fruit it is an excellent plan to set traps formed in this way. Half-fill wide-mouthed bottles with sugared beer or a mixture of treacle and water. Tie string round the bottles so that these can be suspended from the tree bearing the ripening fruit. Once the wasps get inside the bottles very few of them will be able to make good their escape.

Of course, a more certain way of fighting the wasp trouble is to find and destroy the nest. A little observation of the course which the insects follow will give some indication of where the nest is likely to be. Wasps form their nests in dry banks, usually round the lower part of a hedge. Mark the spot with a stick so that the position can easily be located again. A wasps' nest can only safely be tackled after dark or, at least, in the evening, and many plans have been suggested. The following simple method can be strongly recommended: Half fill a wine bottle with turpentine. Then, when the time comes, invert the bottle, without a cork, into the hole leading into the nest. Plaster damp soil round the neck of the bottle to prevent the escape of the fumes. Next morning the nest may be dug out and burned. It will be found that the turpentine and fumes arising from it will have killed many of the wasps and stupefied the rest so that no risk is involved in digging it out.—S. LEONARD BASTIN.

INSECTICIDES.

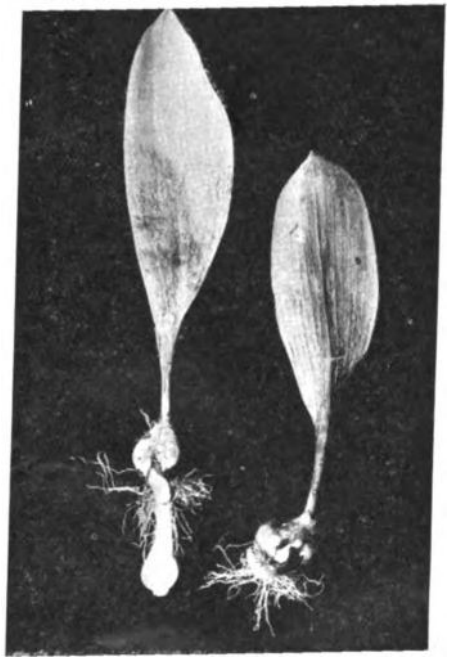
SUMMER warfare against insects brings into play a certain number of powder preparations as well as liquid sprays. Under some circumstances it is inconvenient to spray plants. The petals of some flowers, liliums, for instance, may be either stained or rendered transparent by liquids containing chemicals, and in the case of plants in window boxes, the glass of windows is not improved in appearance by being bespattered with spray fluids. The old-fashioned tobacco powder, pyrethrum and hellebore powders are capable of doing good service without causing any of the troubles that may arise through sprays being distributed beyond the desirable limits. Various brands of tobacco powder are on the market, made by Messrs. Corry and Co., Hunter and Gow, G. H. Richards and other firms, and some blends of tobacco and pyrethrum are also put up, and are very effective against aphis, small caterpillars, slugs, etc., success being largely dependent upon the fineness of the powder and upon the efficiency of the bellows or distributor.

Alum, soda and potash in powdered form enter into the composition of some of the most powerful slug and snail destroyers. The destruction of slugs baffles many garden owners, and it may be explained that an almost invariable rule is that two applications of powder sprays within twenty-four hours are necessary to ensure complete success.

Some soil fumigants are only safe to use on vacant land, but even these may be used in summertime on vegetable plots between the lifting of early potatoes and re-cropping with winter greens, etc. A good deal may also be done with such preparations as Kilogrub, Vaporite and Abol soil pest destroyers, by making holes with a dibber at intervals of a couple of feet and as far as convenient from the roots of plants or vegetables, dropping a small teaspoonful of powder in each and immediately covering with soil.—L. I. ATRIS.

PROPAGATION OF TULIP BY SCALE LEAF.

AS everyone knows, this is an easy way to propagate the tulip, and a successful method compared with raising the plants from seed. I have been interested for some time in the movement of bulbs, and how the movement is done. Every bulb seems to have a method peculiar to itself. In the case of the tulip the downward travel takes place by the throwing of the newly made bulb down to a depth which depends on the strength of the scale used, or the amount of food material which it contains. The illustration shows



YOUNG BULBS FROM THE TULIP SCALE.

two tulip scales of equal size. The one on the right was pressed down into a sand frame to a depth of 3ins.; while the other was placed on the surface with the top of the scale above the level of the sand. Both scales, however, were in close proximity to one another. The right-hand scale shows the young bulb being formed on the side in the ordinary way, whereas the left-hand scale shows the young bulb being thrown down into the sand, where it would ultimately reach its own depth.—L. B. STEWART, *Edinburgh*.

Red Spider, Thrips, Black and Green Fly, Mildew, Rust and all Fungoid and Insect Pests are killed with one application of the

FERRY BRAND (Regd.) Trade Mk.

INSECTICIDE (Non-Poisonous)

Here is the opinion of a user; "Kingsclere, Newbury.

"I am writing to testify to the good quality of your Insecticide.

"I had the Black Fly very badly on a crop of Broad Beans, but one single application cleared the plants of every trace of Fly and now are quite clean and healthy and have a good crop of Beans on them. I would recommend anyone to use it, also your Antiseptic.—A. C."

HORTICULTURE AT THE ROYAL SHOW

YEAR by year, so it seems to the interested onlooker, the horticultural interest in agricultural shows increases, and so far as the Royal Show is concerned, it may certainly be said that if the horticultural features had been isolated they would of their own accord have made a show equal in extent, variety and unquestionably of quality, to the best of the provincial shows which are, in their way, big events in the gardening world.

It is not so very many years ago since the only horticulture one expected to find at the "Royal" was a few samples of vegetables and these were chiefly for field culture rather than the garden.

Of this year's display we can say nothing better than that it is fully up to the "Royal" standard and this notwithstanding the fact that sufficient entries and applications for space were received too late for acceptance to have filled another huge marquee. Messrs. Sutton and Sons did much to add to the beauty of the show ground. Outside the Royal Pavilion their bedding scheme of blue and yellow was both tastefully and excellently carried out, and their large plot laid out as a model flower and vegetable garden was the envy of all.

During their stay of several hours on the show ground, Their Majesties made a complete tour of the flower tents, evinced the keenest delight and interest in the exhibits, chatted with practically every exhibitor and highly pleased the visitors by their charming manner toward one and all.

It must be candidly admitted that in view of the liberality of the prizes offered by the Society, the entries in the competitive classes were few in number. This, we are aware, was largely due to the aforementioned late intimations of the wish to exhibit, but in a few cases, at any rate, the result was that an element of luck attended the winners of prizes ranging in value (first prizes), from £6 up to £45.

The schedule opened with a group of miscellaneous plants in or out of bloom, and Messrs. Jas. Cypher and Sons, Cheltenham, were easily first of the two entries. Their group was in the characteristic "Cypher" style, with gorgeous crotons, choice summer-flowering cypripediums and the graceful white sprays of Francoa ramosa.

Messrs. Blackmore and Langdon faced no competition for a group of tuberous begonias, but so magnificent were their flowers, many of the plants carrying six or eight monster and perfectly modelled blooms, that in the severest test the result would have been as safe.

Only three entries were forthcoming in the big group of hardy perennials, but they were three magnificent exhibits. Messrs. Maurice Prichard and Sons, Christchurch, worthily received first prize. They had some remarkably fine kniphofias, which were a tower of strength to their exhibit, but grace and elegance was secured by judicious disposition of the airy and cool-looking astilbes and Poterium tenuifolium album. Messrs. W. Artindale and Son had some wonderful eremuri in their second prize exhibit. One variety named Sir Arthur Hazlerigg, is of deep rich old gold with an oversheen of greenish amber, giving the flower an irresistible charm. Delphiniums and lupins were outstanding features of Messrs. Harkness and Son's exhibit. Among the former, John Laye Harkness is of striking distinction, but its characteristic strength and beautiful columnar form have been imparted to several seedlings of which it is parent.

Mr. T. Carlile was first of two good entries for a representation of a border of growing herbaceous plants. Delphiniums were a principal item, but masses of astilbes, potentillas, armerias, the best of the herbaceous salvias, erigerons and veronicas were tastefully foiled by drifts of silver-leaved artemisias, thymes and the choice little Veronica incana. Messrs. Artindale's second prize group contained much that was good, and there was, in both exhibits, considerable improvement in the interpretation of the representation of a border, which has at previous shows been, generally speaking, disappointing to those who originated the class in the hope of seeing something more natural.

Sweet peas ranked among the best of classes so far as entries were concerned, but the first prize exhibit of Robert Bolton and Son was, metaphorically speaking, head and shoulders above the rest, good, indeed, though every exhibit was. Mr. Bolton is a past-master at the dual art of growing and showing, and he had all his novelties of this season, as well as such varieties as Gold Crest, Mammoth and Wembley, in excellent form. The second prize exhibit staged by Mr. J. Stevenson, Wimborne, contained a number of the exhibitor's own varieties, one named La France being particularly attractive. Messrs. E. W. King and Co. were third in this strong class of some half dozen entries.

In roses again, competition was very keen and while Messrs. Waterer, Sons and Crisp, Limited, unquestionably scored on quality of bloom throughout they were much too heavy in arrangement to please many critics. Messrs. Elisha Hicks obviously suffered through the deluge of rain which throughout the district immediately preceded cutting time, but their skill at staging brought them up to a very close second place.

In a tent by themselves, Messrs. R. Wallace and Co. made a beautiful informal water garden with choice nymphæas and appropriate reeds, etc., surrounded by natural groups of moisture-loving irises, spiræas and astilbes, with bamboos and colonies of Lilium regale.

Messrs. Waterer, Sons and Crisp, Limited, made a very fine water and iris garden, which would have been infinitely more imposing had it not been cramped for space. The Iris Kæmpferi were really fine, both in variety, development and arrangement, and a specially bright and good form of Spiræa palmata occupied a prominent and correct position on a mound beside the watercourse.

Another elaborate piece of work was carried out across the opposite end of the tent by the new firm, Messrs. Wilson and Agar, Reading. A rushing torrent of water splashing down between massive rugged rocks into a meandering stream afforded the environment for ferns, spiræas, ranunculus, mimulus, etc., the drier portions of the rock-work being well planted with familiar rock plants and dwarf shrubs.

Smaller, but full of interest, was the rock garden of Messrs. Maxwell and Beale, who contrived to find suitable positions for their well known ericas, for potentillas, a few late-flowering primulas and other plants of colour and merit. The weak spot in the exhibit was the background, which lacked a few appropriate shrubs or tall plants.

Hardy flowers were abundantly shown, the distant firm of Messrs. John Forbes, Limited, Hawick, Scotland, bringing a fine collection of pentstemons, phloxes, pansies and assorted herbaceous flowers, which, despite their long journey, were staged in capital condition and showed far less sign of suffering from bad weather than some of the near at home exhibits. The famous scabious from Messrs. Isaac House and Son, Westbury-on-Trym, were shown in a new and attractive manner, flesh pink heucheras, astilbes, statice and armerias being used as garnishing to great advantage.

Messrs. Dobbie and Co. made a bold display of sweet peas, which embraced big masses of the delightful lavender blue variety, Gleneagles, and the strongly coloured Royal Scot, as well as Miss California, Hebe, Majestic and others of popular favour.

Messrs. Sutton and Sons' end of the tent group was impressive in its extent as also superb in its quality. One scarcely needs mention a variety for it seemed that the finest in every colour group was here shown and the deep orange and scarlet shades were free from sunburn or weather stain. Magnet was among the very finest, but Avalanche, King Mauve and Tom Sykes were all good.

Mr. E. Gallagher, Chalk Hill Nurseries, Reading, put up a good array of border flowers, among which the uncommon white form of Aconitum Napellus, a large and bright form of Alstrœmeria chilensis and the still brighter A. aurantiaca were noticeable.

Messrs. Bakers had grand delphiniums, embracing some of the largest and most serviceable varieties for garden and exhibition. Messrs. Harkness and Sons put up a group of lupins in which the bronze, orange and apricot shades were finely represented and there were also mauves of restful and artistic shades. Messrs. G. Gibson and Co. made great use of poppies, verbascums, delphiniums, lupins and a host of other seasonable flowers.

SWEET PEA COMPETITION

£50 IN PRIZES

RULES.

A list of your choice of the six most popular sweet peas to be sent in in order of preference on the coupon to be found on page ii of this week's issue of THE GARDEN. *No alternative* varieties will be allowed in the one list, but readers may send in any number of lists, provided that they are written on the special coupon to be found in this and the following issues of THE GARDEN.

Coupons must reach this office not later than Saturday, July 31st (after which date no coupons will be accepted).

The popular vote will be final, and no correspondence will be entered into over this competition.

Envelopes must be marked *Competition* and addressed to THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

The Editor will not be held responsible for letters missing in the post.

The result will be announced in THE GARDEN in the issue of August 28th.

The prizes are awarded to those whose list corresponds most closely to that arrived at by the popular vote.

If two readers tie for the first place, the first and second prizes will be equally divided; if two for the second place, the second and third prizes will be equally divided.

The Editor's decision on all points will be final.

PRIZES.

1ST PRIZE.—Goods worth £20 from any advertiser in the pages of THE GARDEN.

2ND PRIZE.—Goods worth £10 from any advertiser in the pages of THE GARDEN.

3RD PRIZE.—Goods worth £5 from any advertiser in the pages of THE GARDEN.

20 CONSOLATION PRIZES of 5s. each from any advertiser in the pages of THE GARDEN.

THE GARDEN

VOL. XC.—No. 2851. JULY 24, 1926

Price Threepence. Yearly Subscription, Inland, 17s. 4d.; Foreign, 17s. 4d. Registered at the General Post Office as a Newspaper and for Canadian Magazine Post.
Editorial Offices: 20, TAVISTOCK STREET, COVENT GARDEN, W.C.2. *Offices for Advertisements:* 6–11, SOUTHAMPTON STREET, STRAND, W.C.2.
Entered as Second-class Matter at the New York, N.Y., Post Office.

WE would remind our readers that this is the last week of our *Sweet Pea Competition* and that all coupons must arrive at this office not later than Saturday, July 30th. From the number of coupons already sent in, it is obvious that this competition has proved extremely interesting to our readers. The entries so far exceed our most sanguine expectations. The results will be published, as originally stated, in the issue of THE GARDEN, of August 28th.

THE flower chosen for this week's plant is Iris Kæmpferi. This iris, so much beloved by the Japanese, has reached a pitch of excellence in Japan such as is only obtained by centuries of cultivation. Mr. Dykes stated that even now the process is unknown by which the Japanese have evolved the great variety of shades and forms from the wild plant. This six-petalled iris is noted for its clematis-like flowers, in which the standards are much shorter than the falls. Few of the named Japanese varieties are in cultivation in this country, but unnamed seedlings are quite commonly met with. They require a somewhat different treatment from other irises. First and foremost, they will not stand lime. They should be kept as dry in winter as possible and be well manured at the same time, then heavily watered whenever they begin to show signs of growth. All lovers of the iris should include a few Iris Kæmpferi in their collection, provided that their soil is lime free.

CHARMING FORMS OF THE JAPANESE IRIS KÆMPFERI.

FROM the number of readers who have written to me regarding ivy on trees, it is obvious that this is a subject in which many gardeners are keenly interested. Almost without exception the writers agree that the growth of ivy on trees causes damage. What is interesting is the fact that the list of trees that are smothered by ivy is vastly increased. Ash, oak, Douglas firs and many others are noted as being badly attacked: in fact, the only tree that appears to be more or less immune is the beech, which is not surprising, although one reader has noticed ivy struggling to make headway even on an old beech tree. One point upon which I asked for information, that has not been forthcoming, is whether there is any noticeable increase in the past twenty-five years of the presence of ivy on trees. I should say that there are distinct signs of increase; but this is a fact that is difficult to prove. Perhaps some reader can produce definite evidence. I did not touch on the subject of ground ivy; but from the letters that have been sent to the Service Department it is obvious that this is also becoming a scourge. Can anyone suggest a preventive or curative measure, other than cutting and trenching, that is permanent? E. H. M. C.

The Last Week of Our Sweet Pea Competition: £50 in Prizes

SOME OLD-FASHIONED PLANTS

JUST as Viola cornuta, to which I alluded in my last article, has been rather elbowed aside by more modern introductions, so has Dianthus superbus suffered "the slings and arrows of outrageous fortune." Once petted and admired, the delight of rich and poor, this good old pink, which made its *début* in 1596, is now hardly ever seen. Yet its large flowers, very deeply fringed and in the most intriguing shades of soft rose and lavender, or white, and deliciously fragrant are singularly lovely. D. superbus will, moreover, flourish perennially in soils too cold and stiff for most of its clan, and it is easily raised from seed.

Dianthus plumarius, introduced from Southern Europe 300 years ago, is rare in our gardens, but naturalised on old walls in a few districts. Now and then one comes across a named form of this species in a nurseryman's list, this consoling us with the fact that we have not altogether forgotten "the father of all the pinks." But I am not banking on sentiment in expressing the view that D. plumarius is deserving of a better fate than we are giving it; I am not presuming to argue that if it was one of the "best half-dozen" pinks in the far-off days when a rock garden was called a "lapidium," it should still hold a foremost place. But I do hold that D. plumarius, on its own intrinsic merits, is well worth a wall or rocky chink because it is beautiful in flower and foliage, deliciously scented and extremely robust, yet of neat and pleasing habit. Equally true would all this be of the true D. cæsius, which is now uncommon.

Double primroses are essentially old-fashioned flowers, the cherished favourites of generations that have passed. If some of these have gone, perhaps never to return, there has arisen a fresh interest in the race which has been instrumental in rescuing many of the best from a threatened extinction. And this applies also to the coloured singles, the older polyanthuses, so quaint and homely, the butter-yellows with their deeply overlapping petals, waved, scalloped and notched, and many of the auricula section that flourished in cottage gardens years ago. But there is scope for a much wider cultivation of these dear old things which, rationally treated, are not nearly so miffy as they are often believed to be.

The cottager's plot seems the reservation we have to thank for preserving for us another antique in the shape of Scilla peruviana, which appeared from south Europe in 1607. This hearty old species, with its deep green, yucca-like leaves and enormous heads of violet flowers nearly 6ins. across, never fails to solicit enquiries as to its identity, for it is now undoubtedly uncommon in most places. There is also a beautiful white variety and a pale blue, if not others, but one seldom sees them offered in our catalogues. All seem perfectly hardy in any light border soil and a few things of the kind are more showy in a buxom, old-fashioned way.

Lychnis viscaria splendens fl. pl. appears to be coming in once again, its fierce crimson undiminished by a period of comparative inaction. But the single splendens, from which this gorgeous and useful plant presumably originated, has apparently all but vanished. This is a matter for regret, for it was a noble plant, and the peculiar virulence of its colour, as well as that of the double one, has its uses and need never offend the most sensitive if associated with, let us say, the blue of Linum narbonense.

THE OLD-FASHIONED DOUBLE LYCHNIS, L. VISCARIA SPLENDENS.

Lychnis Flos-jovis has only just survived its two hundred years, but, given suitable company, this old-time cottager's favourite and the still less common L. diurna fl. pl. still possess qualities sufficiently meritorious to justify their claims to a more generous recognition.

If Betonica grandiflora superba cannot disclaim the possession of the offending blue in the crimson-purple of its flowers, the colour of the latter is so gentle, it harmonises so well with the handsome foliage, especially in partly shaded places, that it is one of the old perennials I should not like to be without. With it I might bracket another labiate, Melittis Melissophyllum, which seems to be as rare in our gardens as it is in the wild. Yet there is a curious charm about its big, pure white, crimson-lipped, hooded blossoms, and it has a long season and an amiable, contented disposition—all qualities which should command for it a more sympathetic public and ensure it a place in our gardens.

A FINE OLD PLANT, SCILLA PERUVIANA.

Also among the balms of physic and fragrance are the monardias, or bergamots. With the exception of one or two varieties of M. didyma—and even they are not so generally planted these days as once they were—most of these old-world plants have practically disappeared, and a similar tale might be told of the sages.

Again, one may look over many gardens and not see that brave old plant, Morina longifolia. Though a native of Nepaul, it is perfectly hardy, its large and prickly, acanthoid foliage is singularly handsome, and when, from June onwards to autumn, this leafage serves as a sort of pedestal for the towering green columns strung with the nodding white and rose-pink flowers, the effect is imposing enough to warrant this plant's inclusion among the best of our border legacies.

A. T. JOHNSON.

(To be continued.)

NOTES OF THE WEEK

SISYRINCHIUMS.

IT it is rather less than a year ago that I saw a sisyrinchium for the first time, and had not a notion what it could be. Leaves like an iris, to which family it obviously belonged, inconspicuous pale creamy yellow half-faded flowers, it was Sisyrinchium striatum; I was quite prepared to agree with Robinson that "only one species is worth growing, namely, S. grandiflorum." Its ugly name, too, was quite enough to put me off. This, by the way, means "pig's snout," from the delight these animals take in grubbing up the roots. The sisyrinchiums, however, are quite an interesting group, existing in many different species to suit all tastes. Some big plants for the mixed border, such as S. striatum, referred to above, others quite small, 6ins. to 1ft. high and very suitable for the rockery. Fibrous-rooted, like Iris sibirica—to which they bear a family likeness with their grass-like foliage—examples of these are S. anceps, with numerous pale blue flowers like little six-pointed stars, and S. Bermudiana, which also has blue flowers, with the additional attraction of a yellow eye. They are late risers and go early to bed, so one needs to catch them at the right moment to see them at their full beauty. S. grandiflorum, singled out by Robinson as the only one worth troubling about, has rich purple pendent blossoms more like a campanula than an iris.

One of them is to be found growing wild in Ireland, near Kerry and Galway. This is S. angustifolium, and is known locally by the delightful name of "Blue-eyed Grass," from its small blue flowers and grassy foliage. Though nearly all the sisyrinchiums are natives of North America there appears, according to Bentham and Hooker, to be "no ground to suppose that it can have been introduced by human agency."—EDWARD CAHEN.

SANGUISORBA CANADENSIS.

The Great Burnet.

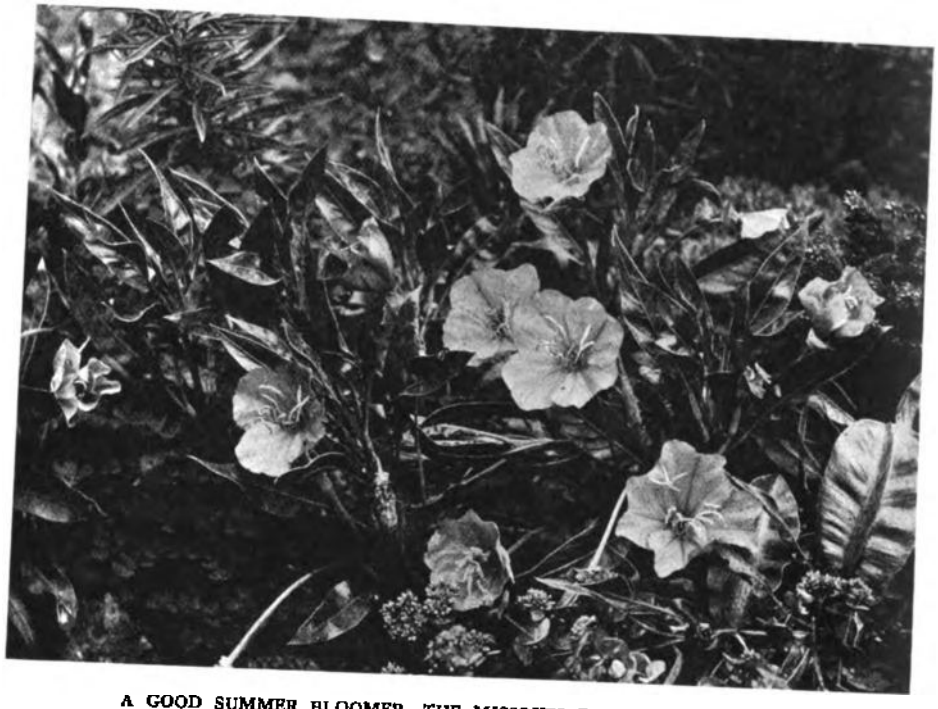
ONE of the most effective bog-loving plants in bloom here at the present time is the Great Burnet. Its handsome foliage of odd pinnate leaves are about 1½ft. long, in dense masses. Towering above these are quantities of white flowers, carried on terminal spikes about 6ins. long, the stems of which are from 3ft. to 4ft. high. I know of no plant that responds better to good cultivation than the Great Burnet.

Planted in deep soil by the waterside, with a liberal top-dressing of decayed manure in early spring, it will prove an attraction the whole summer and early autumn.

It is easily propagated from seed sown in the autumn or by root division in early spring; the latter should be carefully done, as the root stock is very thick and does not lend itself to this propagation as most herbaceous plants do. The Great Burnet should be planted 4ft. apart all round to allow for their proper and luxuriant development.—R. MOORE, *Thorpe Hall.*

THE MISSOURI EVENING PRIMROSE.

WE too seldom see the trailing œnotheras, or evening primroses, and even the easiest of all, Œ. missouriensis, or macrocarpa, is rarely met with nowadays, although it is quite a good plant for the rock garden or the front of the border. It is of true prostrate habit with good-sized leaves and large soft yellow flowers. It is much more easily cultivated than its ally, Œ. speciosa, although not so choice in the eyes of the *cognoscenti* as the latter. Yet it looks exceedingly well hanging over a stone in the rock garden or trailing over the rockwork edging of a herbaceous border. It only rises a few inches in height. The Missouri evening primrose can be purchased in pots and planted out at any time, but a cheap way of raising a stock of plants is by sowing seeds under glass in spring, or in fine sandy soil outdoors in early summer. It is a true summer bloomer, but continues to bloom for a considerable time.—S. ARNOTT.



A GOOD SUMMER BLOOMER, THE MISSOURI EVENING PRIMROSE.

VERBENA CHAMÆDRIFOLIA.

THERE are few subjects on the rock garden at the present time to compare with Verbena chamædrifolia for brilliance of colour. The intense scarlet flowers are assembled a dozen or more at the end of a stem varying from 3ins. to 6ins. in length, and are produced freely over a considerable period. In habit the plant is a trailer, and as roots arise from many of the nodes, a ready means of increase is provided. Furthermore, plants which are cut back in the autumn will throw out strong young growths in the ensuing spring, which are very suitable for cuttings. It requires a light soil and a sunny position.

In many quarters doubts are entertained respecting the hardiness of this plant, but I have been noting a number that have withstood a series of severe frosts during

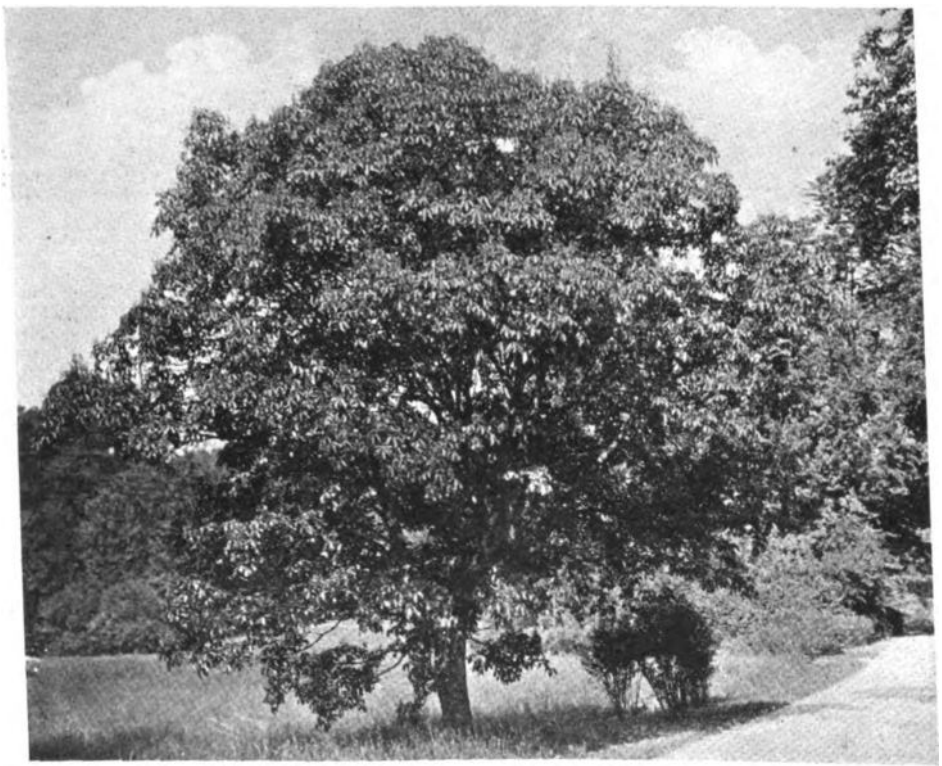
THE BRILLIANT SCARLET FLOWERS OF VERBENA CHAMÆDRIFOLIA.

Digitized by Google

the past winter, and the result would indicate that the plant is perfectly adapted to this climate. On no occasion was the least protection afforded, and although the thermometer fell as low as 12° Fahr., none of the plants succumbed. Possibly, however, some of your more northern readers may treat this verbena with greater suspicion.—W. HOWELL.

A FINE HYBRID HORSE CHESTNUT.

WHEN I visited an Austrian park not far from Vienna years ago I found a fine specimen of horse chestnut which was named by the head-gardener Æsculus Pavia. I was at once surprised by the size of the tree, because the true red horse chestnut even at its best in its native home scarcely exceeds 20ft. in height. But at the first sight of the tree I could hardly distinguish from the true species. After a close examination I came to the conclusion that it is one of several hybrids between the red and the sweet, or yellow, horse chestnut,



A FINE HYBRID HORSE CHESTNUT.

known as Æ. octandra or Æ. flava. This is closely allied to Æ. Pavia, but is the largest of its genus in the New World, occasionally attaining a height of about 120ft., according to Britton. The hybrid forms between these two species are now called Æ. hybrida, and are often met with in our parks under the name of Æ. Pavia, which is a rare plant on the Continent as well as apparently in Great Britain.

Another fine hybrid of this genus seems to be Æ. Bushii. It was found in the State of Alabama, and when I first received tried specimens from the Arnold Arboretum I regarded it as a hybrid between Æ. discolor and Æ. glabra. The last is the well known Ohio buckeye, while Æ. discolor is a small species very similar to Æ. Pavia, but with the leaves densely pubescent beneath. When I, later, saw a good specimen of Æ. Bushii at the Arnold Arboretum, my first impression proved to be correct. I never met this fine hybrid in a European garden. It is hardy at the Arnold Arboretum, and therefore ought to resist our winters in the warmer parts of central Europe.—CAMILLO SCHNEIDER.

AZALEA ROSÆFLORA.

GENERALLY sold under the above name, this delightful little shrub is really a variety of Azalea indica, but it is much hardier than the varieties of A. indica usually met with and I know of many gardens in the north where it has stood unscathed during the most severe winters of more than a decade. The writer has grown it for many years and it is always a favourite with him, although there are a good many who prefer single to double flowers—as the writer generally does—but A. rosæflora is such a delightful little shrub and its double flowers are so pleasing, that it is hard to do without it in the garden.

I saw somewhere the other day that it was only a few inches in height, but I have had it 18ins. high and of corresponding diameter. It has several branches, thinly clad with little bronzy leaves and numerous flowers, produced over a long season, from May onwards, of a good rose or salmon red. These flowers open almost like those of a rose, but eventually assume the appearance of some of the double varieties of A. indica as seen so often under glass. It is classed as a "peat loving" shrub, but it thrives quite well in ordinary loam, or loam, leaf-soil and sand.

According to some, it loves partial shade, but I have grown it quite successfully in different aspects, from full sun to shade. It does not like drought, however, and in a dry situation, where it received much sun, I found it advisable to give it occasional drenchings of water, applied at the roots and not over the foliage. A. rosæflora is an excellent subject for the rock garden and its outstanding beauty and distinct character render it of high value there, while it may also be well grown in the front of the shrubbery.—S. ARNOTT.

HYBRID LUPINS.

IT is delightful to notice what is being done by selectors and hybridists for our old border favourites! Later to receive specialised attention than some kinds, the lupin is now coming into its own, and already there are dozens of varieties available, not all first-class, it may be confessed, but most of them very fine. One of the earliest hybrids was raised by crossing the popular polyphyllus with arboreus, the tree lupin. Since that yellow variety was put on the market there are many others available, in a wide range of colours—selfs, bicolors and tricolors; most kinds, also, possess more or less of the sweet fragrance of the tree lupin, and all flower with the delightful profusion of polyphyllus.

The older yellow Somerset gives way now to the better variety Sunshine. Primrose Queen is another fine yellow sort. Among the reds one can have such a gorgeous kind as Delight (Downer's), a distinct red, much deeper and better than the fine pinks which were all the rage fifteen years ago. Fairy I consider to be one of the best pinks, but pinks of good quality are still easily raised from seed. May Princess is a blue, with purple shading through it. Fascination, a rosy purple, shaded with lavender. Mayflower has a light sky blue colour in prominence; Admiration, a blue and white bicolor; Wargrave Beauty, a purple, shaded red; Dresden China, a peculiar blend of three or four colours, white, bluish-grey, mauve and yellow; Aimée, a bicolor, yellow and reddish brown; Pink Tunic, a soft rose red; and Poilu, a fine blue from the Continent.

These and other fine varieties can be had, but, of course, plants are a trifle expensive, and many will turn, in these hard times to the raising of plants from seed. Seed should be sown at once and the seedlings planted out in the open, 6ins. apart, as soon as they can be handled.—CLYDESDALE.

NORTH BORDERS IN SUMMER:

SOME ADVANTAGES.

HOW often one hears of comparisons made in respect to the progress and growth of plants on south and north borders, much to the disadvantage of the latter? Most of us, I think, watch for the earliest signs of life in the promise of spring flowers under the shelter of south walls, and give little thought to bulbs and plants in colder positions that come with their buds and blossoms, not many weeks later!

May I make a confession here of a lesson I learnt last spring about the blooming of wallflowers? When removing my plants to their final quarters in November, precedence was given to the warmest available space the garden afforded and afterwards it was found that there were some good sturdy plants of Sutton's Fire King and Orange Bedder left. These were planted out on a north border, with very little faith, let it be admitted, because, somehow, we had become prejudiced of anything above ground being planted there for spring blooming. In the severe weather of January, those plants were frost bound and covered with snow, presenting a very forlorn appearance and it was not expected that any of them would survive the ordeal. It was a pleasant surprise, therefore, to find when milder weather came, how quickly they recovered, and when in the late days of April the plants on south positions began to bloom, those on the north border followed in about a week or ten days later. To the astonishment of most folks who saw them, there were only a few losses. As in the springtime, so it is in these summer days, we

Digitized by Google

find the earliest results on the south borders, and we do not always appreciate the cooler position. We speak of "that cold north border" as something to be put up with and forget that in a time of drought, when the water-pot is frequently in our hands, that a few yards away there are similar plants grateful for the partial shade which falls upon them, which enables the flowers to unfold gradually and to develop to a greater degree of perfection. I have in mind one such border where delphiniums, phloxes, campanulas, lythrums, asters and veronicas, among other things, are grown. They are always later in blooming than the same kind of plants in what many are pleased to call "more favourable situations," but one remembers after all, that they prolong the display and on this account one is thankful that, in the garden, both sunshine and shadow fall.

Just at this time some of us have growing on for providing beauty under glass in a few months hence, plants of primulas, cinerarias, solanums, cyclamens in pots, to name a few. These are in cold frames, being kept cooler still by standing them on beds of ashes; the lights are off most of the time and if ever we were inclined to congratulate ourselves that the frames are placed in a north aspect, we do so now. We may be taking full advantage of the sun's power in the frames under the south wall, wherein are cucumbers or melons, but we cannot forget that the coolest side of the garden is good for plants that, when summer days are gone, will reveal their petals under glass and will be finer because of gradual development.

Nor can we shut our eyes to the fact that on north borders quite a number of annuals sown in May, have a longer—and let it be said—a more prosperous career during parching, hot days than some which were sown in sunnier quarters; I allude to Virginia stock, Shirley poppies, nicotianas and larkspurs. Seldom is it that admittedly cold positions are selected for planting roses, preference being given to sunny aspects—yet, I have a distinct recollection of an old rose—a favourite with many even now, being planted as a climber on a north wall, because in a south position, its orange buff blooms bleached very quickly in the sun—William Allen Richardson, to wit. Years ago, I knew an old man whose sole delight in his garden was a long border of calceolarias, which he propagated and wintered in a cold frame and then in May, planted them out on a cool north border. They were always a success and he attributed it to the fact that only in the morning did the sun reach them, and they enjoyed coolness for the rest of the day. I think there is a deal to be said for his theory. CLAREMONT.

THE LACHENALIA

A USEFUL SOUTH AFRICAN BULB.

THE several references which have lately appeared in THE GARDEN have evidently created an appreciable amount of interest in these beautiful South African bulbous plants, and as the present time is just about the right period for potting up, a few detailed notes may be useful, especially to any who may be making a first attempt at their cultivation. Just a few points of special treatment are worth noting, though in most respects they are very accommodating and easily managed subjects. Early planting, at about the end of July or very soon after, is most desirable, thereby allowing a long period of growth and subsequent ripening of the bulbs; good, sweet compost and perfect drainage

LACHENALIA NELSONI, AN OLD FAVOURITE.

A VIGOROUS ORANGE-YELLOW SELF.

Digitized by Google

are very important; a good compost is equal parts of mellow fibrous loam, leaf mould and peat, with a generous helping of coarse sand. The bulbs are small, about the size of a filbert nut, so a six-inch pot will accommodate half a dozen quite comfortably, and a dozen of one variety in a 9in. pan makes a fine show. It is well to be somewhat careful about the watering. Enough, but not too much, during growth and flowering; and then, when the blooms are over, the bulbs can be gradually left to absorb the retreating moisture from the foliage, the pots being placed on a top shelf where the sun can give them a good baking. If so desired the bulbs can remain in the dust-dry soil until the time comes round to shake them out and plant them again. They are cold-house plants, but actual frost during the growing period is distressing to them. Thirty-five degrees seems to be about as low a temperature as they cheerfully accept, and the air should be kept as buoyant as safe ventilation can make it, avoiding stagnant damp as much as possible.

If one knows lachenalias at all it is probable that Nelsoni, tricolor and luteola are typical of varieties most familiar, but these are now left far behind by some of the newer beauties which originated among the Whitewell seedlings—raised in the first place by the late Rev. Joseph Jacob, and further developed by one or two enthusiasts who are following up his work. Some distinct varieties have been established, but several of them are not yet in sufficient quantities to be offered for general distribution. In the meanwhile, such fine types as Siam, a rich yellow self; Monte Carlo (A. M.), a much improved tricolor; Rutland, a strongly marked quadricolour; Pegu, pale yellow, with green points and red lips; Goldfinch, an improved Brightness; Leiden, an orange yellow self, are all sure to please and make up a grand half dozen to go on with. Or a mixed assortment of Whitewell seedlings is quite a good proposition, and is sure to yield some interesting results.

Perhaps special attention should be called to an old variety which has been grown for many years under the name of pendula, if only because it is the one above all others which can be had in bloom at Christmas, or even in November, if desired. It is a solid red, slightly tipped with green and gives a welcome splash of colour at a time when flowers in the cold house are few; it is not scarce and is well worth a place in one's collection, there being nothing yet to take its place in point of colour and in earliness of blooming.

As decorative plants for the home, either in pots or as cut flowers, lachenalias are very effective and lasting and invariably attract attention by their novelty and unfamiliar beauty. We like to think, however, that they are rapidly becoming less novel and less unfamiliar. W. DAVENPORT.

SOME WILD ROSES IN CULTIVATION

THE order rosaceæ claims a very large percentage of the most beautifull woody plants, the typical genus of which may well be termed the queen of flowering shrubs. Although—

THE FRAGRANT AND VIGOROUS ROSA HELENÆ.

in continuance of flowering, size and, in many species, fragrance of bloom—the wild roses do not equal the garden hybrids, they have many advantageous qualities to their credit.

Generally speaking, the species are stronger in constitution than the hybrids, and thus less susceptible to pests and fungoid diseases. It would be difficult to imagine a more beautiful picture than a flowering group of R. Moyesii or R. Hugonis in the wild garden, where, with the exception of removing such weeds as one may deem unsightly, no time is given to cultivation.

Taller growing kinds as the two previously named, and such species as R. septipoda, R. Willmottiæ or R. macrophylla, may be grown as single specimens on the lawn or in similar conspicuous positions.

The rampant climbing species, as R. longicuspis, R. moschata and R. Souleiana, could be planted for screening purposes; the latter forms a dense, impenetrable mass of long intertwining branches.

The well known Japanese rose, R. Wichuraiana, although now eclipsed by its numerous progeny, is the most useful species for covering banks, etc. The compact, bush-like species are quite in keeping when planted in the shrubbery, to which, when in flower and fruit, they add colour and are attractive throughout the year.

There are few genera which more readily cross-fertilise, so that, without the seed is saved from solitary individuals, this means cannot be relied upon for propagation. While it is possible to root all the species from cuttings, many are difficult to reproduce in this way. This is especially true of the better Chinese species.

R. Banksiæ, a climbing plant from China, has long been grown in this country. It is a beautiful rose, but is, unfortunately, too tender, except for the more favoured, milder localities of this country. The flowers are either white or yellow, and of each there is a double form.

Two remarkably distinct species of first-rate merit are R. bracteata and R. lævigata; both have large white flowers, but neither is suitable for any but the warmer counties. The golden yellow anthers of R. bracteata resemble those of Eucryphia pinnatifolia.

R. Davidii forms an erect shrub 6ft. to 8ft. high, producing about eight flowers in a somewhat corymbose inflorescence, rose shading to a pale pink towards the centre of the flower. In autumn these are followed by clusters of conspicuous red fruits. The variety elongata differs from the type in its fewer flowers and more elongated fruits.

As one of the parents of the well known "hybrid perpetuals," R. damascena has made its name. Although a plant long cultivated, its origin is veiled in obscurity. The fragrant blush white or red flowers are borne in large clusters.

Another of Mr. E. H. Wilson's introductions is R. Helenæ, a tall, strong, rampant grower, producing numerous fragrant white flowers in terminal corymbose inflorescences.

While, in so varied and beautiful a genus, it is not possible to term any individual species the best, one would not be very wide of the mark in classing R. Hugonis as one of the six most charming hardy wild roses now in cultivation. It forms a compact vigorous shrub, with

Digitized by Google

gracefully arching branches. The feathery fern-like foliage is a good setting for the continuous clusters of clear soft yellow flowers. When leafless, the slender brown branches and thin spines are distinctive.

The "Austrian Briar," R. lutea, is a remarkably pleasing species, thriving well in the full sun in a comparatively dry border. It stands foremost of the long-introduced hardy shrubby species, forming a dense rounded bush of about 4ft. high. The solitary golden yellow flowers are profusely borne, but very seldom produce fruit. Equally charming in character and more unique in colour is the variety punicea, commonly known as the "Austrian Copper" briar. The flower is similar in form to the type, but the colouring is a coppery orange-red.

There are few species showing such divergences as R. macrophylla. Plants of this name were introduced early in the last century, since which during the last twenty-five years, there have been several forms introduced from China. It is a strong-growing, erect bush, attaining about 8ft. or 10ft. high. The flowers vary from a vivid lilac pink to deep blush red about 2ins. to 3ins. across. The pendent clusters of large elongated fruits crowned with long striking sepals, rival in attractiveness the hips of R. Moyesii.

A rampant-growing species, R. longicuspis, from China, has been confused with the European R. sempervirens. In gardens it may occasionally be seen bearing the name of R. Sino-Wilsoni, and sometimes that of R. lucens. The outstanding characteristic of this white flowered scandent bush is the dark, almost blackish-red colouring of the stout young shoots and the long, persistent, glossy green leaves.

Although closely rivalled by R. Hugonis, R. macrophylla and others, the most popular species is, undoubtedly, R. Moyesii. Not only for its glorious display of large rich crimson flowers in May, but equally so for the magnificence of its autumnal splendour. R. Moyesii is an erect-branched shrub, about 8ft. or 10ft. high and rather over half as much through. The flowers are usually evenly disposed, either singly or in pairs, each blossom being about 2½ins. to 3ins. across. The attractive orange-scarlet fruits are about 2ins. long and of an elongated pear-shaped form. No less beautiful is the variety R. Moyesii rosea, with its rose pink flowers. This variety may be rarely seen in gardens labelled R. Fargesii, under which name it has been sent out by one or two Continental nurserymen.

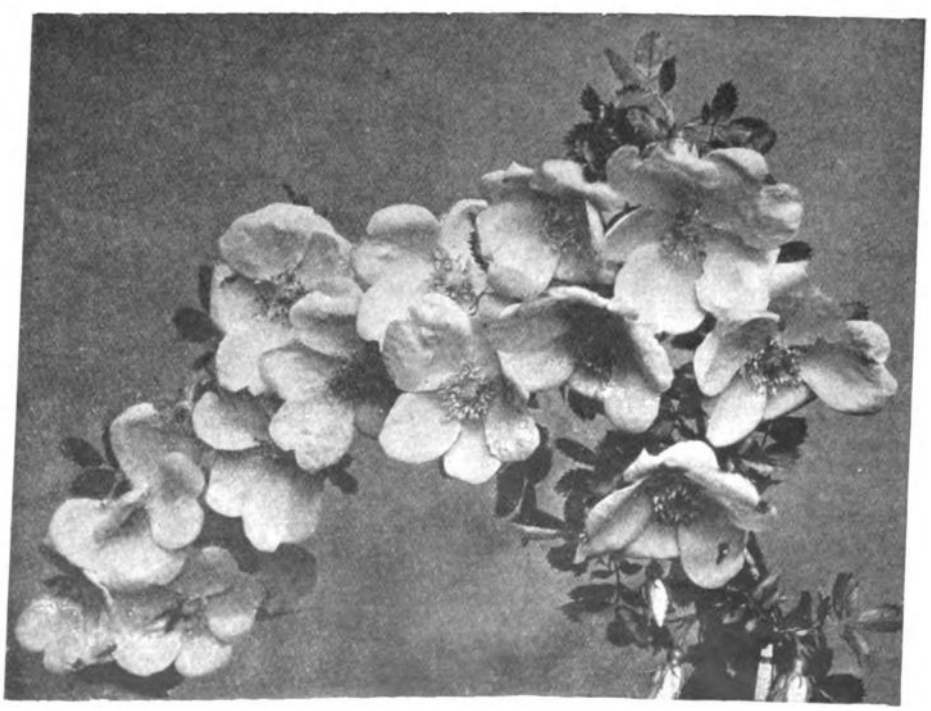
Mention must be made of the dominating parent of the now extensive class known as polyantha roses—R. multiflora, a native of China, Korea and Japan, distinct on account of its floriferous nature. The small white flowers are borne in large much-branched panicles.

R. nitida, from eastern North America, is a compact dwarf bush, rarely more than 2ft. high, studded with bright rose-coloured flowers. An attractive quality of this useful dwarf under-shrub is the colour assumed by its foliage in autumn.

Although R. omeiensis is a variable species it cannot be confused with any other except R. sericea, and is easily recognisable at first sight. This Chinese rose makes a dense bush 6ft. to 10ft. high. In its typical form its distinctive characteristics are its small solitary white flowers, with only four petals, rarely five, the unique parti-coloured bright red and

THE LARGE WHITE FLOWERS OF THE FINE R. BRACTEATA.

ROSA HUGONIS IS A UNIVERSAL FAVOURITE.



THE WELL NAMED AUSTRIAN COPPER BRIAR.

Digitized by Google

orange of the pear-shaped fruits, with their fleshy fruit stalks, and the densely set spines on the branches. The variety R. omeiensis atrosanguinea has fruits of a uni-coloured deep crimson; while the variety pterocantha is conspicuous by its wide flattened spines, which may best be observed when the bright sunlight penetrates these red translucent structures.

Perhaps the most beautiful European wild rose is R. rubrifolia. Unlike most of the members of this genus, it is the foliage rather than the flowers which gives attractiveness to this species. The reddish coloured leaves are overlaid with a glaucescent bloom, forming an outstanding background, in the spring and early summer to the rose-coloured flowers, and in early autumn to the bright red hips.

R. rugosa is one of the commonest species in cultivation and an early introduction from China. It is a strong-growing plant, flourishing in almost any soil. It does not often attain a greater height than 4ft. or 5ft., producing either solitarily or in clusters large bright magenta fragrant flowers.

As previously stated, a plant which may easily be confused with R. omeiensis is R. sericea, with which it has several characters in common. The latter-named plant is native of northern India and the Himalaya, and differs mainly in the fewer leaflets, thinner fruit stalks and in the flower being cream-coloured rather than white.

R. setipoda is another striking member of the rich Chinese flora, which in habit of growth may be likened to R. Moyesii or R. macrophylla. The flowers of R. setipoda are bright pink, becoming pale and almost white towards the centre. Each flower is about 2ins. to 2½ins. across, produced on long slender peduncles in a many-flowered corymbose inflorescence. The fruits are but little less in length than those of R. Moyesii, but narrower, of a polished scarlet surface.

The Siberian variety altaica of the Scotch briar, R. spinosissima, far supersedes the type in its large creamy white flowers, which are about 3ins. in diameter. The large flattened, almost globose fruits become nearly jet black when ripe. Like the type, this geographical variety forms a dense bush, throwing up many stems from the ground and seldom attaining a greater height than 4½ft.

Unique in its elegance is the Chinese rose R. Willmottiæ, becoming a dense bush about 8ft. high; its much-branched, slender, somewhat pendulous stems and dainty foliage are alike glaucescent. The usually solitary flowers are an uncommon shade of lilac pink, followed by orange red fruits about ½in. long, conspicuous by the absence of sepals. H. G. HILLIER.

CORRESPONDENCE

IVY ON TREES.

SIR,—In his Editorial about "Ivy on Trees" in THE GARDEN for July 10th, "E. H. M. C." states that he "cannot remember ever having seen it on a horse-chestnut or on an ash, and certainly not on an oak or ilex." In this district it is quite common on both the ash and oak and I know of several large ash trees and also small oaks nearly or quite killed by it. To-day I saw it growing on an ilex.—W. A. SHOOLBRED, *Chepstow*.

SIR,—I am surprised to see in his Editorial on "Ivy on Trees," "E. H. M. C." says that he has not seen it on ash. Here, sixteen miles from Bath, we have comparatively few elms, but many ash, and the ivy grows on them freely and also on beech.—WALDEGRAVE, *Bath, Somerset*.

SIR,—While cordially endorsing the view expressed by the Editor (page 383), upon the mischievous prevalence of ivy on our forest trees, I do not understand his observation that it does not climb upon oak, ash or horse-chestnut. Here in the west these trees have to be relieved of ivy as regularly as any others. Beech does not offer it ready hospitality because that tree fills the upper soil so densely with its own roots, but even beech requires attention sometimes. No doubt our atmosphere, moister in the west than in the midlands and on the east coast, is favourable to the growth of ivy, which will not flourish in the United States, owing, probably, to the severe winter cold.—HERBERT MAXWELL, *Monreith*.

ARUM LILIES IN THE OPEN.

SIR,—Referring to the correspondence in your issue of June 12th and 26th, I enclose an illustration of these lilies which have been growing in the open by the side of a stream in my garden for the last twenty years. They are, as Mr. Bastin observes, cut down by the early winter frosts, but come up again in the spring and flower freely from the middle of June onwards. This may interest a few readers of your very interesting paper

ARUMS BY THE SIDE OF A STREAM.

and assist in stimulating the culture of these beautiful flowers.—ALFRED POPE, *Winchester*.

IRIS DOMINION.

SIR,—It would be interesting to know whether this wonderful iris has failed to keep up its great reputation in this country, as several people tell me it is disappointing. I planted a small rhizome eighteen months ago in my garden on the Island of Capri (Italy) without any special attention. Last year it made foliage, great blue-grey leaves over 2ft. 6ins. high, and this spring it flowered. One stem thicker than my little finger bore five blooms larger than any iris in my collection and of a texture like the deepest purple velvet, the only drawback being that this peculiar texture has a tendency to spot with rain (next year it will have a special umbrella!). It is clear that the limestone soil of Capri *and* the sun are what it requires, otherwise why is it not in the place of honour in every English garden, especially as the foliage retains all its decorative beauty for several weeks? I have never tried it here.—(Lady) ALGERNON GORDON LENNOX, *Drumnow*.

TOMATO PLANTS UNDER GLASS.

SIR,—On page 355 of THE GARDEN, June 19th, a sketch by Mr. Geo. Garner shows a tomato plant of the main batch as now growing in an amateur's glass structure. If a tomato plant is examined it will be found that the flower trusses are produced on one side of the plant only. They are certainly extra-axillary, but they are not produced haphazard nor are the trusses alternated with the leaves as shown by Mr. Garner. After the first truss appears the plant produces its remaining trusses after every third leaf. Occasionally one finds a plant missing a truss and when it does we have to count six leaves before getting the next one.

If growers plant their tomatoes when the first flowers are showing, then the plants should be planted so that the flowers and fruits are given the maximum sunlight.—GEO. STUART, *Edinburgh*.

GOOSEBERRY PESTS.

SIR,—In THE GARDEN, June 19th, page 353, "W. H." asks readers to give their experiences with the various sprays used to check American mildew on gooseberry bushes. I have been carrying out experiments for a number of years with a view to finding out a cheap and effective fungicide and am glad to say that washing soda wash keeps the disease in check and allows one to pick a clean crop of fruit.

One may not be able to cure bushes after they are contaminated. Spraying after the disease is found on bushes is like locking the stable door after the horse is stolen. Prevention is better than cure. Commence the control of the fungus disease by pruning carefully during winter and then spray the bushes in February with a good caustic wash, such as 1lb. caustic soda in five gallons water. In May and June bushes should be sprayed, before the disease appears, with washing soda, made up in the following manner. Dissolve 1lb. washing soda in half a gallon of boiling water, stirring in 2 oz. of soft soap and dilute by adding three and half gallons of cold water.

The wash must be applied with plenty of force and in the form of a fine mist, taking care to spray the under sides of the bushes.

Another good fungicide is lime-sulphur, but unfortunately certain varieties are defoliated when this wash is used. The varieties I have found defoliated by using lime-sulphur are: Broom Girl, Early Sulphur, Gee Wing, Leveller and Lord Elcho.

In regard to "W. H.'s" questions: (1) It would be quite safe to plant gooseberry bushes on the same ground after the discarded bushes were uprooted and burnt; still it would be better to crop the ground for a year with vegetables to give the soil a rest. In answer to question (2) It is possible to spread the disease on one's clothing. Winds, rain, insects, etc., also carry infection from one plantation to another. The disease spreads with greatest rapidity during warm, damp weather. American mildew and potato blight can both be spread by the mycelium and also by spores.—G. S.

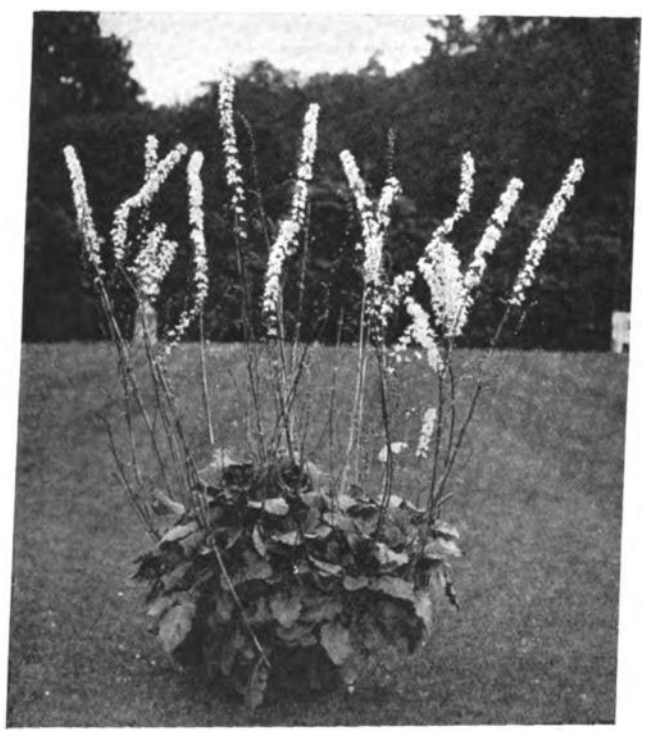
FLOWER GARDEN AND GREENHOUSE

FRANCOA RAMOSA.

The Maiden's Wreath.

THIS plant, wonderfully profuse, with its flowers borne on long, curving, slender stems, is very serviceable for a greenhouse which is kept but moderately warm in winter, or, as is so often to be seen, it makes a capital subject for a sunny window. Needing only a plain compost—loam, leaf-mould and sand—it can be grown to perfection by anyone taking it in hand. Plants, too, are soon raised from seed sown in the warmth of the greenhouse in spring, and by the following year will have reached their blooming stage. Francoas receive a deal of attention as window plants, and one may often see them with leaves clustering over the sides of the pots, with their long trailing sprays of white flowers. Less frequently does one meet with F. appendiculata, with reddish crimson flowers. Plants are often allowed to go for years without being re-potted, and begin to show this by inferior blossoms. One notices this in cottage windows where francoas and vallotas often are grown together. Young plants of francoas bloom the best, and in these circumstances it is well to renew them occasionally and dispense with those that are worn out. One may have them in bloom during the winter in the greenhouse, provided plants have been prevented flowering in summer.—W. F.



THE MAIDEN'S WREATH, FRANCOA RAMOSA.

BERRIED SOLANUMS.

SOLANUM CAPSICASTRUM forms a strikingly beautiful plant in the autumn, when well grown and bearing large, richly coloured berries. I have frequently seen straggly, bare-stemmed specimens with a few badly coloured berries at the end of the summer season. I do not know of a plant that can be grown with deeper green leaves than this solanum when properly treated, and the following is the kind of treatment I recommend: In May, young plants, whether raised from seeds or cuttings, will be ready for potting in 4½in. pots, and their best position will be one in a frame facing due south. They must be kept safe from frost, but not subjected to a high temperature nor to a moist atmosphere at the same time. Cold frame treatment until June 15th, open-air treatment until August 25th, then cold frame again until early in October, prior to placing the plants in the greenhouse or conservatory. The compost should be moderately rich: fibrous loam, leaf-soil, rotted manure, a small quantity of soot and also bone-meal. The plants are formed into fine well shaped bushes by timely stopping—the pinching away of the tips of the most forward shoots from time to time until early in August. At an early date flowers will develop on strong plants, and syringings on fine afternoons will help to set them. While the plants are growing in rows on beds of ashes, they should be fed almost daily after they possess plenty of roots in the final pots. Clear soot water is very beneficial.—G. G.

HARD-WOODED PLANTS IN POTS.

Summer Neglect.

THE failure to bloom in the greenhouse in spring certain hard-wooded plants like camellias, azaleas, epacrises, heaths, boronias—peat lovers—and also deutzias, of which the old D. gracilis is still popular, together with that sweetly scented yellow shrub, Genista (Cytisus) fragrans, may be traced to the treatment meted out to them immediately they have ceased to bloom or during the summer months. The professional gardener is fully alive to the importance of no change being made in the treatment of any of them, so far as keeping them indoors is concerned, until after the new growth, upon which depends the following season's bloom, has been completed, but the amateur does not always appreciate this and, possibly requiring room in the house for other plants coming along, transfers his azaleas, etc., into cold frames, and this change being effected in May, a most trying month owing to variations of temperature, it is not surprising that the plants suffer a check from which it takes time to recover. Or, if it is not in spring when a removal is made, one now and again finds that when plants are placed in frames, or out of doors in the open, they are allowed to become so dry as to ruin chances of bud formation. The amateur gardener is liable to overlook that peat is a very close and retentive medium, and in watering his plants does so in a very parsimonious manner instead of giving them a thorough soaking, which is the only way for moisture to percolate the tightly bound roots. This is a point worth bearing in mind at the present time, and erring on the side of liberality in watering in a dry time is all to the good.—W. LINDERS LEA.

MANAGEMENT AND RIPENING OF LATE GRAPES.

NATURALLY late-ripening varieties of grapes require very careful attention from the time when the new shoots begin to grow until the berries are perfected. Even expert cultivators guard the crops, and the vines bearing them, with some anxiety, lest any mishap may occur; so the amateur cultivator can be excused for exhibiting anxiety regarding the crop's welfare. The varieties generally grown are Black Alicante, Muscat of Alexandria, Gros Colmar and Lady Downes. One very helpful point is the starting of the vines in good time in the early part of the year. The young shoots should be growing by the middle of March, then the resultant grapes should be fully matured by the end of October. Of course, the black grapes should be coloured by the second week in that month, being coloured quite black, however, does not mean that the grapes are perfectly ripe then.

In July, towards the end of the month, the berries of all late grapes will be in various stages of "stoning": that is, the stones or pips in them will be hardening. During this stage, which lasts about twenty-one days, only clear water should be applied, not any stimulant. Directly the stones are hardened the flesh of the berry becomes soft and swells considerably, and feeding will again be beneficial.

A few weeks later the black varieties will begin to colour and the white ones to turn to a golden amber, a colour so much desired by growers. Feeding should be continued during this stage of development until the colouring process is complete, then use clear water only and maintain a rather drier atmosphere. But up to the start of the colouring stage plenty of atmospheric moisture is necessary in hot weather, and a closed vinery during the night-time. While the berries are ripening, maintain the drier atmosphere in reason—and do not entirely close up the top ventilators. Fire heat, if only a little, will be very beneficial.—GEO. GARNER.

ROSE CULTURE.

Treatment of Plants Growing in the Greenhouse.

IF plants in pots are grown, as well as some in the borders, the season of flowering may be a prolonged one; indeed, some expert cultivators are able to cut roses nearly nine months out of the twelve. The amateur with a limited experience may not be able to do so, but if he possesses a suitable glass structure he can have rose blooms available from April 1st to the end of October—seven months. Plants growing in pots should be placed outside now as soon as possible if they are still under glass. Plunge the pots to their rims in ashes or sand or in leaf-soil, and several times each week vigorously syringe the branches with clear water. It is very important that the roots are not allowed to become quite dry. Carefully remove all weeds and loose soil from the surface of the pots, practically baring the top roots. Have in readiness a sufficient quantity of fibrous loam to afford a good top-dressing forthwith. Use the loam alone and not with any rotted manure, as the latter becomes too dry in the summer. But before applying the lumpy loam soak it in liquid manure for twelve hours.

Mildew will do considerable harm unless checked. As a remedy use "Abol" or "Medela." Syringe vigorously to destroy green fly, first using tobacco powder on the shoots of choice sorts. Directly any flowers have faded remove them from the plants, and during July cut off the ends of some of the strongest shoots—about one-third their length—a second crop of flowers will be borne on the resultant shoots in early autumn. Usually new shoots bear blooms in six weeks' time. The strong-growing hybrid teas are the best to be so treated.—HANTS.

THE CULTURE OF BEARDED IRISES.

THOSE fellow readers of THE GARDEN who have grown the old German Irises for years and been uniformly successful with them although they have never spared a thought as to their culture, will doubtless smile at my title. It is, of course, true that in certain rather light, clean soils these plants will flower freely and the blossoms will be little out of character, even though the only attention they receive is lifting and dividing when they become excessively overcrowded.

Not everyone, however, has such natural soil, nor will the possessor of such find it of much avail should his plants unhappily become infected with rhizome-rot. To obtain the best results with these irises, particularly as regards size of flower, the soil should not be over-light; it should, on account of the "rot" danger, contain a fair percentage of lime, but it should *not* contain any appreciable content of humus. Burnt earth, particularly if rather on the heavy side before burning, suits them admirably and may be used freely. Drainage should be free, the site where they are planted open to sun and air, and the root-stocks should at no time be buried to more than half their depth.

There seems no doubt that varieties which are shy to flower—and some of the newer ones are rather shy—flower best when planted in full sun and left to establish themselves for a year or so, but there is wide scope for systematic investigation as to the comparative requirements of the different sections. Personal experience would suggest that the squalens and variegata sections are more weatherproof than the stately pallidas and trojanas, for instance. The former appear to withstand with greater equanimity—if the word may be pardoned—summer heat and winter wet.

The same remark will apply with equal force to planting times. It is by no means clear which is, in fact, the best planting season—indeed, there are considerable differences of opinion on the question—but may not the fact be, after all, that different sections and, since so much inter-crossing has taken place, different varieties, even though somewhat similar in appearance, transplant best at separate seasons? Such an investigation might not be of much practical value, since the average gardener would scarcely care to plant half a dozen sorts of iris at different seasons, but it would be interesting none the less.

MIDSUMMER AT VINCENT SQUARE

THE season of shows will soon reach its height. All over the country floral fêtes, both large and small, are being well supported by the trade as well as by the amateur exhibitor. In spite of this multitude of shows, the variety of exhibits and standard of excellence at the fortnightly meeting of the Royal Horticultural Society last week was quite up to its usual level. Some of the growers had to stage large groups of flowers on the same day at shows elsewhere, and yet they found enough material to do every show justice. Rose specialists particularly have had many demands upon their stock. Several growers of the national flower had large and imposing exhibits in the hall. Upon the stand set up by Messrs. Alex. Dickson were innumerable varieties arranged in large baskets. Each variety was in fine condition, and only such sorts which are especially useful for garden decoration had been selected. Lady Worthington Evans, Betty Uprichard and Richard E. West are a few examples. This firm deserves the congratulations of the horticultural world, for again this year the Clay Cup, presented to the raiser of a rose with the true rose scent, was won by them. Dame Edith Helen is the name of the variety. It is a rose with not only fragrance to recommend it, but beauty of colour and form, excellent substance and a remarkable lasting quality as a cut flower.

Single roses were a feature on the stand of Messrs. Chaplin Brothers. Among them Mermaid, a beautiful hybrid of Rosa bracteata, was outstanding. It is a large-flowered sulphur yellow rose with conspicuous amber-coloured stamens and glossy green foliage. Innocence was yet another attractive single variety shown by this firm. Mr. H. J. Pemberton was exhibiting several of his famous musk roses, such as Pax and The Adjutant. Messrs. Laxton Brothers had a group of their delightful new rose Bedford Crimson which filled the surrounding air with its fragrance. Dainty Bess, the charming coral pink single rose, was shown by its introducer, Mr. W. E. Archer. Hybrid tea roses of all kinds were exhibited by Messrs. F. Cant and Co.

Herbaceous flowers were, perhaps, one of the largest classes of plant to be seen at the show. Mr. B. Ladhams' stand included a number of plants of real value for the herbaceous border—coreopsis, campanulas, heleniums and a number of other flowers which combine robustness of constitution and long blooming season, as well as beauty, were exhibited by this grower. Bedding Queen, a fine new perennial coreopsis, is undoubtedly a great acquisition. Kniphofias and herbaceous phloxes were much in evidence among hardy flowers exhibited by Messrs. M. Prichard and Sons. The crimson red feathery spikes of Astilbe Granat, Chrysanthemum Mayfield Giant with its immense white blooms, the Oriental poppy J. Mason, and Potentilla Hopwoodiana were also to be seen. Messrs. G. Reuthe had a varied and interesting collection of hardy plants, and among them were Ononis natrix, Catananche cœrulea, Stuartia pseudo-camellia and Plagianthus Lyallii.

Romneya Coulteri, with its large papery-white blooms, was exhibited by Messrs. Waterer and Co. The free-flowering Œnothera Fraseri, Galega officinalis Hartlandii Her Majesty and Genista ætnensis, the Etna broom, were also included in this group. A number of spiræas, several ceanothus and veronicas were shown by Mr. R. C. Notcutt; Spiræa Menziesii triumphans, S. virginiana, Ceanothus Marie Simon, Potentilla Farreri and Rhus Cotinus atropurpurea, a dwarf form of the Venetian sumach, were among the plants noted. Iris Kæmpferi Purple Patch, as shown by Messrs. R. H. Rogers and Son, made a brilliant mass of colour and blended well with the violet blue tones of Eryngium Violetta.

An oblong lily pool, in which floated nymphæas of every hue, surrounded by moisture-loving plants of all kinds, formed the interesting and attractive exhibit of Mr. Amos Perry. Attraction, Masaniello and Moorei were a few of the largest and finest water lilies. Senecio Veitchianus, with its tall spikes of yellow flowers; Pistia stratiotes, the water lettuce; and Jasione perennis were planted in clumps by the waterside.

A magnificent group of sweet peas was put up by Messrs. Dobbie and Co. Their principal varieties were Warrior, Mrs. T. Jones, Miss California, Grenadier and two novelties, Gleneagles, a beautiful lavender blue, and Magnet, a rich cream pink. Hydrangeas in blue and pink of many tones were shown by Mr. H. J. Jones; the colouring as well as the habit of the plants was exceedingly fine. Such hydrangeas as Mrs. H. J. Jones, La Marne and Blue Prince, which were on show, are a wonderful improvement on the old varieties.

There were several good exhibits of carnations, and particularly fine were some of the border carnations of Mr. J. Douglas, and the Allwoodii pinks of Messrs. Allwood Brothers. Mr. C. Engelmann staged a selection of the best perpetual carnations; Messrs. Allwood Brothers had perpetuals and border carnations; Mr. C. Herbert showed several of his novelties, the most attractive being Mrs. Giffard Woolley and Fire King. Both bedding and exhibition violas were shown by Mr. W. Yandell. A very interesting group of uncommon vegetables came from the gardens of Sir William Lawrence and Messrs. L. R. Russell and Mr. F. G. Wood both showed shrubs and alpines.

Messrs. Sanders, St. Albans, staged a very interesting orchid group comprising no fewer than eighteen different genera. Cypripedium niveum was effectively staged in batches, while in the centre was a grand specimen of Dendrobium thyrsiflorum with a dozen many-flowered spikes. At one end was the showy Brasso-Cattleya Miranda, apricot yellow with a reddish lip, and at the other end Brassavola Digbyana, from which it had been derived. Species were represented by Cattleya superba, Epidendrum elatum, E. macrochilum, and the pretty Broughtonia sanguinea; while oncidiums were staged in oblongatum, pulvinatum and Harrisianum.

Messrs. Cowan and Co., Southgate, staged a pretty group of various species and hybrids. Along the front were several examples of the scarlet-flowering Cochlioda Noezliana, and farther back some of the odontiodas which have been obtained by crossing it with the odontoglossums. A richly coloured hybrid was staged in Lælio-Cattleya Minos, and a natural hybrid in Oncidium Gardneri, the prevailing colour being chrome yellow, marked with red-brown. Cypripediums were best seen in St. Albans, crimson red; and Maudiæ magnificum; while the centre was occupied by Cattleya Warscewiczii var. F. M. Beyrodt, a showy flower, white, with a bright purple lip.

Messrs. Charlesworth and Co., Hayward's Heath, exhibited a select group of Odontoglossum crispum hybrids, among them being O. ardentissimum xanthotes, with bright yellow spotting; and O. Tagus, a singular result in which the sepals and petals are blotched with a much lighter colour than the labellum. Cattleya Mendelii alba bore four white flowers, and Odontoglossum cordatum aureum a spike of yellow flowers with markings of a deeper tint.

NEW & RARE PLANTS

AWARDS OF MERIT.

HEMEROCALLIS MARGARET PERRY.—A showy looking day lily of about 4ft. in height. The flowers are deep orange, shaded with bronze in the throat and lighter on the reverse. Shown by Mr. Amos Perry, Enfield.

CARNATION EARL BEATTY.—A deep velvety crimson border variety. Its chief merit lies in its sweet old clove scent. Shown by Mr. W. E. McCracken, Long Eaton.

NYMPHÆA AMABILIS.—A large-flowered water lily of a delicate flesh pink shading to rose and deep red in the centre. The stamens are most conspicuous and clear yellow in colour. Shown by Mr. Lionel de Rothschild, Exbury, Hants.

NYMPHÆA ATTRACTION. — A beautiful variety with immense blooms of deep crimson streaked with white. The clusters of orange red stamens and golden anthers give a striking appearance to the flowers. Shown by Mr. Lionel de Rothschild, Exbury, Hants.

Digitized by Google

ROSE FRANK READER.—A deep cream hybrid tea variety of good substance. The tea-scented blooms are well shaped, the foliage is a dark glossy green. Shown by Messrs. D. Prior and Son, Colchester.

ROSE JACK HOBBS.—A very free-flowering hybrid polyantha with semi-double flowers of bright cherry red. The petals are prettily crinkled and the foliage is light green in colour. Shown by Messrs. D. Prior and Son, Colchester.

CAMPANULA DONALD THURSTON.—This tall, handsome bellflower bears large open pure lilac flowers measuring about 2ins. across. The blooms are well placed and the habit of the plant is good. Shown by Mr. F. L. Thurston, Farncombe Gardens, Broadway, Worcester.

TRITONIA LYALINA.—A beautiful member of this family with glowing orange salmon cup-shaped flowers closely set on slender arching stems. This tritonia was raised by Miss Willmott over twenty years ago at the same time as T. Prince of Orange. Shown by Mr. E. A. Bowles, Myddelton House, Waltham Cross.

DEUTZIA TAIWANENSIS.—Numerous graceful racemes of whitish flowers tinged with mauve are borne by the slender branches of this ornamental shrub. The petals are pointed and the golden yellow stamens conspicuous. Shown by Mr. G. Loder, Wakehurst Place, Ardingly Place, Sussex.

HEBRIA ROSEA ELEGANS.—A tender low creeping plant which forms a thick carpet, roots being formed at the joints. The specimen exhibited was well established in a pan and bore a number of solitary bright red flowers on stems of not more than 1in. in length. The flowers are dainty and delicate in texture, while the tiny oval leaves are thick and glossy green. Shown by Mr. J. Preston Warren, Hayes, Kent.

ABELIA SCHUMANNII.—A small, tender, deciduous shrub with a graceful habit of growth. The funnel-shaped flowers are pinkish and tinged with yellow in the throat. The leaves are opposite, small, ovate and light green in colour. Shown by Mr. J. Preston, Warren, Hayes, Kent.

ORCHIDS.

LÆLIO-CATTLEYA LUCRETIA VAR. MILLY (L.-C. luminosa aurea × C. Maggie Raphael alva).—The former parent is noted for its clear yellow sepals and petals, while in the latter parent the segments are pure white. In the resulting hybrid the sepals and petals are clear lemon yellow, while the labellum is intense purple with a crimson tinge, the extreme margin being rose-tinted and the edge undulated. From Messrs Black and Flory, Slough. Award of merit.

LÆLIO-CATTLEYA APHRODITE, BROADLANDS VARIETY.—A well grown specimen with three spikes and a total of eleven large flowers of rose tint, the petals flushed with purple along the midrib, and the labellum purplish crimson. The parents are C. Mendelii and L. purpurata. Cultural commendation. From Mr. E. R. Ashton, Camden Park, Tunbridge Wells.

A CARNATION SHOW

THE National Carnation and Picotee Society (Southern Section) held the first of their two annual shows in the hall of the Royal Horticultural Society on Tuesday, July 13th. Owing to the excessive heat the flowers, exhibitors and visitors alike had a trying time of it; nevertheless, it was a good Show. In the class for eighteen selfs, Mr. Douglas of Bookham was in good form and gained first place, followed closely by Messrs. Lowe and Gibson and Messrs. Seymour and Anderson in the order named. Outstanding flowers in these groups were Mrs. Peter Vlasto, a new pure white; Bookham Scarlet, Mary Murray, Joan Wardale, Deliciosa and Mrs. Horace Dee.

In yellow ground fancies, Mr. Douglas again led, Messrs. Seymour and Anderson capturing second place, with Messrs. Lowe and Gibson third. Some of the old favourites are still conspicuous among the yellow grounds, *viz.*, Linkman, the two Shackletons (Lieutenant and Lady) and Pasquin.

The white ground fancies contain many of the grandest border carnations in cultivation, and the honours here went to Mr. Douglas, Messrs. Seymour and Anderson, Messrs. Lowe and Gibson and Mr. Morton. Flowers specially noted were Mrs. J. Fairlie, Flora McIvor, John Stobart and A. St. Clair Amos.

In the special class for cloves, Mr. Douglas was first, Messrs. Lowe and Gibson second, and Messrs. Seymour and Anderson third. The best blooms were King of Cloves and Steerforth.

Fancy carnations always appeal to the public by reason of their wonderful contrasts and blends of colour. Here Messrs. Lowe and Gibson were first and Messrs. Seymour and Anderson second, and the conspicuous specimens were Myrtle Pettigrew, Sam Griffiths and Cleopatra.

The amateurs put up many exhibits of really high standard, and in Division II Miss Shiffner of Lewes again demonstrated her position as one of the best cultivators in the country. In twelve classes in which she exhibited she collected no fewer than ten firsts, a remarkable record considering the competition she had to face from experienced and clever growers. Among her blooms was the premier white ground fancy of the whole Show—Mrs. E. Charrington. Mrs. Hambro of Kidbrook Park, Forest Row, Mr. Charrington, Mr. Fairlie and Mr. Keen, all of whose names are familiar, took the other leading places.

In Division III Mr. Hart and Mr. Palmer were the most successful entrants; and in Division IV, Mr. E. G. Lowe, Mr. S. H. Gregg and Captain Wilkinson came off best.

The seedlings attracted a lot of attention, as usual, but some of the flowers were past their best. Mr. Murray of Worcester Park was conspicuous, as usual, winning all the three prizes. First position went to a lovely new creation in pink and grey, christened Ida Gray, which gained an award of merit; Christine Prior, very fine blooms, but just past their best, being second. The latter is an enormous white ground fancy with immense shell-like petals of purest white lightly marked silver lavender grey. This gained a first-class certificate.

Mr. Douglas got three certificates for Flora McIvor, Mrs. Peter Vlasto and Flamingo, the last appearing to be a very large "Queen Eleanor" type.

The largest carnation show of the year will take place on Wednesday, July 21st, at The Carpenters' Hall in the City, and all who take an interest in carnations of the hardy border type should on no account miss the opportunity of seeing the collection staged there. The show will be opened by the Lady Mayoress and continues till 6 p.m. Admission 1s.

FRUIT AND VEGETABLES

RETARDING CURRANTS.

ANY plans which will prolong the season of the typical summer fruits are worth considering. In the ordinary way red and white currants begin to ripen from the end of June onwards. There is no special reason for being in a hurry to gather the whole of the crop, providing this is not required for immediate use. White currants will hang for two months after ripening and the red will remain in good condition for even longer. In fact, fruit allowed to remain is sweeter and generally of better flavour than that which is gathered as soon as colouring up takes place. Bushes in open positions where there is a full amount of sunshine are best protected in some way to make sure that shrivelling does not take place. Practically any kind of material may be employed for covering. Matting is the most suitable, but even old lace curtains, if these are fairly thick, are not to be despised. The time to cover in the bushes is when the fruit is about three-parts ripe. Arrange the material so that there is no chance that wasps or birds can get at the fruit. All the covers should be removed about once a week, a dry day being chosen for the purpose. This is quite essential, as in damp spells there is always a risk that, through lack of ventilation, mildew may appear. When uncovered go over the bushes very carefully, taking away any withered foliage or fruit that shows signs of decay. In this way the season of ripe red and white currants may be prolonged well into the autumn without any deterioration in the quality of the fruit.

Black currants are not quite so easy to retard although, even here, a decided lengthening of the season may be secured without risk. Cover the bushes with material when the fruit is about half ripe. Leave the bushes uncovered for a few hours on a dry day each week and remove all decaying foliage and fruits. Close watching is desirable, for when once the currants start to drop it is a sign that gathering cannot safely be deferred any longer.—S. LEONARD BASTIN, *Bournemouth.*

VEGETABLE GARDEN.

Treatment of Vacant Ground.

IT is only in exceptional cases where it is desirable to leave ground in the vegetable garden uncropped, *e.g.*, when it is necessary to clean a weedy plot of ground thoroughly. This can only be dealt with by excluding all kinds of crops for a time, and there is no better time than the late summer or early part of autumn. Where readers now possess plots of very weedy ground—I am referring to coarse and deep-rooted kinds—they should at once trench the soil, extracting the weeds and well loosening the subsoil, while leaving the top portion in a rough, lumpy state. In the case of clayey ground it is advisable to leave the soil in this state throughout the winter. There will not be any difficulty experienced in working heavy soils, so treated, during the ensuing spring and summer, as the exposure to frosts, air and rains will have pulverised and sweetened it so much.

Vacant ground soon becomes infested; either weeds or insects, or both, take possession and are detrimental to crops. Surface weeds are soon destroyed. In one hour's time the weeds on a big plot can be hoed, and if the day is sunny they die before sunset. If there are insects present, well soot and lime the ground; put on the former first and the latter a few weeks afterwards. The burning of dried weeds and haulm on the soil does the latter good and destroys pests wholesale.

If the ground is sweet and clean, crop it forthwith. Early-maturing turnips, radishes, lettuces and endive may be raised before the cold weather comes.

Then there are the spring cabbages and the autumn-raised onions to be considered. The seed-bed of the first named will not occupy much space, but the plot to be occupied by the young transplanted plants must be prepared. The same remark applies to the onion quarter, only in this case the resultant plants may be thinned out and some of the thinnings transplanted to enlarge the bed. In both cases the soil must be cleaned

Digitized by Google

and dug. Meanwhile the young plants will be growing to the transplanting stage and young weeds will be growing on the newly prepared plots. It is a simple matter to hoe and destroy these seedling weeds prior to the planting-out of the onions and cabbages some time towards the end of September; then these particular plots will remain clean throughout the winter months.

If the soil is poor, apply rotted manure in liberal quantities; dig it in, break up the lower soil thoroughly, mix lime with the top portion at the rate of 1 peck per square rod. In due course, break up the top lumps while they are dry, and also firm the ground by beating it with a garden fork, not a spade. If the soil is rich enough, add the lime only, but at the rate of 2 pecks per square rod. If the soil is clayey, do not firm it; if very light or sandy, tread it moderately while dry and do the planting when it is dry too.

Every plot not cropped should be trenched or ridged to admit air and rain, and not left with a hard unbroken surface.—G. G.

FORCING CHICORY, SALSAFY AND SCORZONERAS.

WHEN green vegetables are scarce during the winter months it is a great satisfaction to be able to rely upon forced roots. Chicory, well grown, is a delicacy. The seeds can be sown from June to July, and the summer cultivation should result in fine, strong roots for winter use. Heat from a hot-bed or pipes spoils the flavour, though it forces the growth splendidly. Fortunately, there are plenty of sheds, cellars and other suitable places wherein we can induce an early growth, and that in a confined space. When the roots are lifted, cut off the tops above the crowns and pack them in finely sifted soil in pots, boxes or in odd corners. Apply water once, then keep the structure darkened and frost excluded. Leave the crowns level with the soil. Do not apply water again unless the young growths droop. If a small portion of the hard crown is cut off with the forced leaves, the head retains its compactness and then it resembles the heart of a well blanched cos lettuce. Salsafy should be stored in sand in any cool, dry shed, or in a dry place outside and covered with boards. Any roots not cooked in the winter should be planted out—if all are lifted and stored—to yield young stems which may be cut and used in the same way as asparagus. Scorzonera should be used to supplement parsnips, lifted as required and cooked in the same way as carrots.—HANTS.

ONIONS SOWN IN AUTUMN.

IT is rather difficult to state when onions ought to be sown in autumn, but, at any rate, we in Scotland like to do so in late July. Earlier sowing has a danger—the chance that the plants, too far forward by winter, receive a severe check and then run to seed. In the midlands, then, early August ought to be soon enough and in the south sowings will probably be best towards the end of that month.

Although there are specific varieties for successful autumn sowings like Giant Rocca, Large Tripoli, Lemon Rocca, White Leviathan and others, the tendency among growers is to prefer the "home" varieties. One of the best is Ailsa Craig, a selected variety being chosen. The plants are perfectly hardy, very few run to seed, and they can be transplanted at any suitable date. Cranston's Excelsior is also in the first class, a good cropper and a popular variety. Among others which we know to be good are Brown Globe, a very fine maincrop onion for kitchen use; Perfection, a good grower of choice mild flavour; and another good one for the pot, Sutton's Long Keeping.—LANARKSHIRE.

MISCELLANEOUS NOTES

FLOWER POT STAND.

AS a general rule many medium and small plant pots are found scattered about the greenhouse, and if at any time these require to be moved, it necessitates a great deal of trouble. By employing two or three stands (Fig. 1), which are portable, the pots are kept together and they may be moved bodily at will. A useful size stand is that constructed to details given in Fig. 2. The ends are of wood and if possible, in one piece. If pieces have to be joined in order to make up the width, this can easily be done by fixing them together with narrow cross battens. The length of the shelves should be about 3ft. 6ins. Holes are cut in the bottom shelf of such diameter that the larger pots will rest in for about two-thirds of their length. The middle and top shelves are supplied with holes to receive small pots. The holes are best cut by means of a small keyhole saw. The end supports should not be less

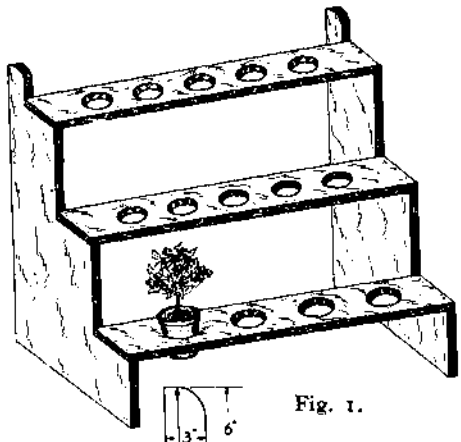

Fig. 1.

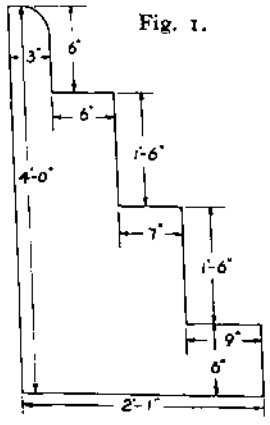

Fig. 2.

than ¾in. thick, and a suitable thickness for the shelves is ¼in. The shelves are fixed in the steps of the end supports by means of screws.

When put together, the whole is well polished with sandpaper and a nice appearance may be obtained by coating with green or white enamel.—W. J. SAUNDERS.

LIQUID MANURES.

AS the time for making use of liquid manures is now at hand, a few hints on the best forms to employ may be useful. First of all, full attention should be paid to the use of liquids prepared from animal manures and soot. Fresh horse dung, fresh cow dung or fresh sheep manure are all suitable for the stronger-growing flowers and vegetables, one peck of the manure giving good results if used in conjunction with a quarter of a peck of soot and thirty to forty gallons of water.

The soot and manure are put into separate coarse bags in the usual way, and these suspended in a barrel of the water. In the case of cow manure, being full as it very often is with insect pests, it should first of all be drenched into the barrel with boiling water to kill the creatures.

As a rule this liquid is rather strong to use as a plant food to start with. It is, therefore, customary to dilute it until it is the colour of weak tea or pale ale, and to apply this in the first instance to subjects which have been previously well watered if the soil is not already in a moist condition, taking care to keep it off the foliage.

In districts where animal manures are difficult to get or cost an unduly large sum, liquid manures can and should be made out of artificials. Superphosphate of lime, sulphate of ammonia, nitrate of soda, nitrate of lime and dissolved bones, which last resembles superphosphate in composition, can all be employed at the rate of an ounce to the gallon of water, but while those containing nitrates or ammonia should only be used where it is desired to increase leaf production, *e.g.*, the cabbage crop, saladings, etc., the phosphatic forms should be largely employed where it is desired to hasten on the development of the crop, *i.e.*, to make garden peas come into bearing sooner than they otherwise would. Soluble potassic fertilisers, of which the principal one is sulphate of potash, can also be used at the rate of an ounce to the gallon of water. Their function is to increase the quality of crops, and only occasional applications, as a rule, can be afforded.

Attention may well be called to a comparatively new group of chemicals employable as liquid manures, namely, those used as intensifiers. The most important of these at the present moment is green copperas or ferrous sulphate, which intensifies the colour of flowers and foliage alike in a most marked manner. In large quantities it is an active plant poison and, therefore, must be cautiously employed. Up to the present used alone it gives good results if applied at the rate of a quarter of an ounce per gallon of soft water. E. T. E.

ROSES AT DUNGLASS.

IDEAL weather conditions favoured the outing of the Royal Caledonian Horticultural Society to Dunglass on July 10th. Quite a large number of the members of the society availed themselves of the opportunity of visiting this Berwickshire garden, which is situated on the East Coast.

Here the air is free from dust and smoke, and the soil is rich and red, and as a garden it is noted for its roses. These enticed everyone to cluster round the many beds which are set out on the well kept grass, each bed filled with one variety.

Mr. Notman, the able head-gardener, informed me that this rose garden was made six years ago and contains 2,500 plants. In a long border were such varieties as Colonel Fitzgerald, Columbia, Donald Macdonald Dorothy Page Roberts, General McArthur, K. of K., Lady Hillingdon, Mme. Edouard Herriot, Mme. Jules Bouche, Margaret Dickson Hamill, Mrs. Wemyss Quin, Ophelia and Red Letter Day. The roses in the beds were Lady Ashtown, Lady Pirrie, Mme. Edouard Herriot, Mme. Jules Bouche, Margaret Dickson Hamill, Mrs. Frank Usher, Mrs. David McKee and W. J. Grant. Mme. Edouard Herriot was exceptionally beautiful, the colour of the blooms—for the plants were all *en masse*—was as good as I have ever seen.

Many pillar roses are also grown at Dunglass, including such kinds as Crimson Rambler Dorothy Dennison, Emily Gray, Excelsa, himalaica, Paul's Scarlet Climber and Shower of Gold. Nor have the old china roses been forgotten, as Laurette Messimy, Mme. Eugène Resal, Old Blush and the charmingly

toned Comtesse du Cayla have all found a home.

The roses were particularly clean, well budded and in perfect health. No doubt the numerous buds which were only partly unfolded on many of the varieties (on July 10) are now, in this tropical heat, making a wonderful display of colour. D. ARMSTRONG.

GARDENERS' ORPHAN FUND.

THE annual festival dinner of the Royal Gardeners' Orphan Fund, held in London on Wednesday last, reminded one of the very excellent work which this Society has been carrying on with the aid of voluntary contributions only, for thirty-nine years. During that period the orphans of many gardeners have been maintained, educated and then trained in some occupation to give them a good start in life. At the present time there are over eighty children dependent on the fund, and to cover the allowances for these children about £1,100 is needed annually.

In a brief but inspiring speech the Chairman, Mr. G. J. Nicholls, pointed out, among other things, that gardeners, by their thought and care, contribute very largely to the interest and beauty of our home surroundings. One should also realise that gardeners' incomes do not permit of their making adequate provision for those they leave behind them, and it is the duty of all who have gained so much in their lives by the contemplation of the restful charm of our English gardens to support, in whatever way they can, this most deserving cause. All lovers of the beautiful whether in plants or flowers, will feel that such a fund has an imperative claim upon their generosity, and an important point is that this cause is one in which a consideration of the very high record of attainment of those who have been helped gives the assurance that it is money thoroughly well expended. Mr. Edward Sherwood (hon. treasurer) gave a number of instances of the great appreciation which has been felt by those who have received benefit, and asked that all willing to contribute should kindly send their donations to the secretary, Mr. A. C. Bartlett, 19, Bedford Chambers, Covent Garden, London, W.C.2.

SWEET PEA COMPETITION

£50 IN PRIZES

RULES.

A list of your choice of the six most popular sweet peas to be sent in in order of preference on the coupon to be found on page ii of this week's issue of THE GARDEN. *No alternative* varieties will be allowed in the one list, but readers may send in any number of lists, provided that they are written on the special coupon to be found in this and the previous seven issues of THE GARDEN.

Coupons must reach this office not later than Saturday, July 31st (after which date no coupons will be accepted).

The popular vote will be final, and no correspondence will be entered into over this competition.

Envelopes must be marked *Competition* and addressed to THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

The Editor will not be held responsible for letters missing in the post.

The result will be announced in THE GARDEN in the issue of August 28th.

The prizes are awarded to those whose list corresponds most closely to that arrived at by the popular vote.

If two readers tie for the first place, the first and second prizes will be equally divided; if two for the second place, the second and third prizes will be equally divided.

The Editor's decision on all points will be final.

PRIZES.

1ST PRIZE.—Goods worth £30 from any advertiser in the pages of THE GARDEN.

2ND PRIZE.—Goods worth £10 from any advertiser in the pages of THE GARDEN.

3RD PRIZE.—Goods worth £5 from any advertiser in the pages of THE GARDEN.

20 CONSOLATION PRIZES of 5s. each from any advertiser in the pages of THE GARDEN.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque ..	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty ..	Pale rose and deep red.
Lohengrin ..	Cattleya mauve.
Mdm. Chereau ..	White, frilled azure blue.
Mrs. H. Darwin ..	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Orifiamme ..	Pure blue and blue purple.
Prosper Laugier ..	Bronzy cinnamon and velvety crimson.
Rhein Nixe ..	White and violet purple.

One plant each of the 12 varieties, **7/6** post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE KITCHEN GARDEN.

Spinach.—In many gardens spinach is an important vegetable and with care and attention it may be picked for the kitchen throughout the year. To keep up the supply in winter a good breadth must be sown at intervals of a fortnight from now till the end of August. Select the prickly or winter variety and sow in lines 1ft. apart. A liberal sprinkling of old soot will be found beneficial and a watch must be kept for slugs. Do not forget a row or two of spinach beet; it is more robust than the above and often proves a useful substitute for the winter variety.

Ridge Cucumbers must not suffer from drought but even in dry weather care must be taken to prevent over-watering.

Shallots will now be ready for lifting and after being exposed to the sun to ripen them, they should be stored in a dry, airy shed. Garlic may be given similar treatment. If the crop of parsley is poor there is still time to make a sowing for winter use.

Cauliflowers will need watching or caterpillars will destroy their appearance and value for the table. Any that are "turning in" may have the leaves tied up over their heads. Other cauliflower plants need plenty of water during a dry spell of weather.

Mushrooms.—Horse droppings can be collected and when a sufficient quantity has been got together a bed may be made up for mushrooms. Spawning should take place when the temperature of the bed is 80° F. All kinds of salads may be sown, and here water will be necessary if the ground is dry.

Winter Onions must be lifted directly the bulbs are ready, otherwise they will commence another period of growth, which will spoil the crop. Lay them out on a hard gravel path or similar spot, the root end of the bulb being fully exposed to the sun. When thoroughly ripened store in a dry, airy place.

Lift first and second early potatoes as they become fit, and finish the planting out of all kinds of winter greens.

THE ROSE GARDEN.

Continue to remove the old blooms and see that no suckers are allowed to develop at the base of the bushes; while weeds must also be kept in check by frequent hoeing. Young growths on the rambler and climbing section must be tied up occasionally and a watch kept for green fly and mildew. A solution of insecticide will destroy the former and one ounce of liver of sulphur (potassium sulphide) dissolved in three gallons of water will prove effective with the latter, but the plants should be sprayed each week if possible. Liquid manure will benefit the trees if applied the colour of weak tea and at the rate of one gallon per plant, but it ought always to be given when the soil is moist. Once each week will be sufficient.

Failing farmyard liquid manure, a fertiliser can be applied while the plants are developing their second growth. Both Clay's and Canary Guano are good and may be sprinkled over the beds during showery weather at the rate of about two ounces to the square yard.

THE FLOWER GARDEN.

The plants in the herbaceous border must be tied up neatly where needed and such subjects as varieties of Phlox decussata will require water if the weather is dry, while a mulch of manure, or grass from the lawn mower, will be beneficial. Early-flowering chrysanthemums can be transferred to the border to produce a display later on, and they will transplant readily from the reserve garden if cut round with a spade a week or so before removal.

Dahlias will need supports. Earwigs, if allowed to remain, will injure many of the flowers. They are easily trapped, however, by placing an inverted 3in. pot filled with hay on the top of each stake. Examine them every morning.

Flower Beds must be kept tidy by the removal of dead leaves and faded flowers, and such subjects as verbenas, ivy-leaved pelargoniums and Phlox Drummondii, may be pegged down so that the whole of the bed is covered.

Iceland Poppies.—These delightful plants are worthy of wider cultivation and as they do not easily transplant, the seeds should be sown where the plants are intended to bloom. Seeds sown now will furnish a display next year. The alpine poppy (Papaver alpinum), is useful and effective for the rock garden.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE FRUIT GARDEN.

Strawberries.—If intended to fruit next year rooted members of these simply cannot be planted too early after this date. If planted late they have no time to establish themselves before winter and many are lost. Well cultivated soil from which the early potatoes have been cleared, if dug over and liberally manured will suit. Select strong, healthy runners from fruitful parents. The distances in planting will be regulated by the vigour of the varieties and the nature of the soil. On a medium to heavy soil King George is an excellent early variety, a little earlier, but not possessing the constitutional powers of Royal Sovereign. The varieties Laxtonian and Bountiful are main-crop varieties of good merit, with Elton Prince for very late cropping. A good average distance in planting is 2ft. between the rows and the plants 12ins. to 18ins. apart in the rows. As soon as the pots used in layering runners for forcing purposes are full of roots repot into 6in. pots. Stand the pots on a bed of coal ashes where the crowns can be well ripened and watering conveniently attended to. Buds from the sides to be removed, as one crown only is desirable.

THE KITCHEN GARDEN.

Other items needing attention in the time not devoted to fruit pulling are the thinning of late-sown turnips and pricking off lettuce, supporting and feeding stem vegetables with liquid manure; the close pulling of kidney and broad beans, possibly peas, when of a proper size; and the swelling of seeds in a few neglected pods causes a cessation of growth.

We are too often careless in the matter of pulling rhubarb. Avoid late pulling, as the crowns beneath the soil depend for their strength on the leaves. Liquid manure from the byre draining will assist greatly in the formation of these crowns.

THE HERBACEOUS BORDER.

In the interest of the plants and to maintain the appearance of the borders the spent blooms of summer-flowering plants should be removed. Also see to it that other tall-growing subjects are efficiently supported.

There is yet time to propagate such edging plants as pinks and iberis of the evergreen types. Cuttings root freely in sandy soil with the frame kept close until roots appear. Occasional dewings overhead will hasten the process. To increase the stock of Heuchera sanguinea and its varieties other than by division, side pieces taken off and treated as above form a ready means. This also applies in the case of lychnis of the double-flowered sorts.

Climbers past flowering should be relieved of spent flower trusses and the growth to provide the following year's flowers secured beyond damage by winds. Others coming into flower should have the main shoots tied out to fill the allotted space. In all cases thin out unsatisfactory growth to prevent overcrowding. As plants in such situations generally suffer from want of water, give this in quantity when required, with liquid manure as an auxiliary.

Weed Killer on Walks and Drives.—It may have been that owing to the unsuitable weather or other causes this operation was prohibited in the recognised time for doing this work. In my own experience of several years good results have followed its application now, under favourable weather conditions, the parts operated on remaining free from weeds for a full year.

Doune, Perthshire. W. MCCARRELL.

THE Director of the Gardens of the Royal Horticultural Society desires us to point out that the trials of nerines and lachenalias started there last season are being continued this. Any grower desiring to add varieties to these trials should send three bulbs of each to reach him by August 15th, 1926, addressed to the Director, R.H.S. Gardens, Wisley, Ripley, Surrey. The necessary entry forms can be obtained on application to him.

DOBBIE'S PLANT CATALOGUE now ready. Free to all readers. Please mention THE GARDEN when writing. —DOBBIE AND CO., LIMITED, Edinburgh.

SEWAGE DISPOSAL FOR COUNTRY HOUSES.—No emptying of cesspools; a perfect fertiliser, no solids; no open filters; perfectly automatic; everything underground. State particulars.—WILLIAM BEATTIE, 8, Lower Grosvenor Place, Westminster.

GARDEN NETS.—Best tanned, small mesh; 25yds. by 1yd., 2/-; 25yds. by 2yds., 4/-; 25yds. by 3yds., 6/-; 25yds. by 4yds., 8/-. Carr. Paid. Satisfaction guaranteed. Tennis nets from 10/-. Special nets for tennis boundary. Pea training nets. Lists and samples free.—G. JARRETT, Netmaker, Rye.

ROCK AND ALPINE PLANTS.—Large and varied collection. All pot grown. Packed and carriage paid. Catalogue free.—M. J. PIGGOTT, Duffield, Nr. Derby.

TANNED GARDEN NETTING, small mesh: 25yds. by 1yd., 2/-; 25yds. by 2yds. 4/-; 40yds. by 1yd., 3/8; 40yds. by 2yds., 6.6; 40yds. by 3yds., 9/9. Measured mesh closed. Special Pea Netting supplied. Tennis Nets from 8/-. Carriage Paid. Compare our netting with others. Sports lists and samples free.—GALLOP, Net Manufacturer, Hastings.

GOLD MEDAL DAFFODILS — CHOICE TULIPS, &c. List on application.—THE WELSH BULB FIELDS, St. Asaph.

LOOK! TANNED GARDEN NETS.—All orders dispatched same day. 25yds. by 1yd, 2/-; 25 by 2, 4/-; 25 by 3, 6/-. Odd netting for bushes, 6lbs. for 2/6. All carriage paid. Any sizes supplied. Also Tennis Boundary Nets.—MOORE AND CO., Net Works, Rye.

LAXTON'S STRAWBERRIES.—New List Containing Novelties for 1926. Prolific, Rearguard, Robust. Also The Duke, Royal Sovereign and all the old Favourites. Plants in small pots for forcing.—LAXTON BROTHERS, Nurseries, Bedford.

PUPILS given general nursery instruction. —Particulars, H. HOPKINS, Waterford Nurseries, Lymington, Hants.

THE CULTURE OF CHRYSANTHEMUMS. By W. WELLS, 2/6 net; cloth, 3/6 net; by post 6d. extra. —Published at the Offices of "COUNTRY LIFE" LIMITED, 20, Tavistock Street, Covent Garden, W.C.2.

A CATALOGUE of gardening books will be sent free on application to "COUNTRY LIFE," LIMITED, 20, Tavistock Street, Covent Garden, W.C.2.

RIVERS' FRUIT TREES, ROSES, VINES, Figs, Oranges and Orchard House Trees are of first-class quality and a large and select stock is always on view. Inspection invited. Price list post free, on application.—THOS. RIVERS AND SON, LIMITED, The Nurseries, Sawbridgeworth, Herts.

SWEET PEAS AND HOW TO EXCEL WITH THEM. By HORACE WRIGHT, 9d. net, by post 11d. Published at the Offices of "COUNTRY LIFE," LIMITED 20, Tavistock Street, Covent Garden, W.C.2.

PLANT PESTS AND PARASITES.—A useful booklet on garden troubles by HORACE J. WRIGHT is to be obtained from the Offices of "COUNTRY LIFE," LIMITED. 20, Tavistock Street, W.C.2; 11d. post free.

GREENHOUSE PAINTING AND GLAZING —"Vitrolite," superior to White Lead Paint, 18/6 per gallon, cans extra. "Plastine," the Imperishable Putty, 32/- per cwt., kegs extra; 7lb. tins, 4/-, post free; 14lb. tins, 5/6 each, carriage extra, tins free.—Full particulars from W. CARSON AND SONS, Grove Works, Battersea, S.W.11.

ESTABLISHED 1804. INCORPORATED 1809.

The Royal Horticultural Society's Amateur Vegetable Show

VINCENT SQUARE, S.W.1.

—— 7th SEPTEMBER, 1926. ——

38 Classes. OPEN TO ALL AMATEURS. No Entrance Fees.

SUBSTANTIAL PRIZES AND CUPS.

For Schedules, apply to THE SECRETARY, R.H.S., Vincent Square, London, S.W.1.

Make this into rich Manure

Lawn mowings, weeds, leaves, etc., should never be wasted. As your garden refuse accumulates, build it into a heap, treating each fresh addition of rubbish with—

ADCO

In a few months you will have a plentiful supply of rich organic fertiliser.
1 cwt. ADCO makes from 2-3 tons of MANURE according to the class of rubbish used.

ADCO ACCELERATOR
(for lawn mowings and soft green refuse)
28 lb., 4/6 ... 56 lb., 8/- ... 1 cwt., 15/-

STANDARD ADCO
(for all other rubbish, bracken and straw)
28 lb., 6/- ... 56 lb., 11/6 ... 1 cwt., 20/-
Carriage paid to nearest Goods Station. Cash with order.
Stocked by all leading Seedsmen, Harrods Ltd., etc.

ADCO LTD., HARPENDEN HERTS.

By Appointment

Largest Manufacturers of Flower Pots in the World.

THE BEST AND CHEAPEST.

SPECIAL POTS for Roses, Vines, Clematis, Orchids, and Chrysanthemums.

Fancy Fern Pans and Bulb Bowls, from 4d. each.

No Waiting. All Orders executed the same day as received.

State quantity of each size required, and have Carriage Paid quotation, or write for Illustrated Price List.

OUR NATIVE PLANTS

IN our Correspondence page of this issue will be found a further letter from Colonel Cuthbert James regarding the diminution of our native flora. In this he makes the suggestion that enthusiasts in our native flora should try to re-establish our rarer plants as far as circumstances permit. This could be accomplished by a society which would help to replenish depleted areas to the best of its ability. There is a great deal to be said for this suggestion. Oddly enough, by this mail I received a letter from Dr. Cockayne in New Zealand, enclosing a cutting from *The Dominion* that describes a proposed open-air museum for plants native to New Zealand. This, of course, is not a new idea, although so far it has come to nothing in this country. What is particularly appropriate at the present moment is Dr. Cockayne's summing up of the uses of an open-air museum. He says: "The main features of the open-air museum are: (1) A well grown collection of, as far as possible, all the species of the New Zealand flora from the North Cape to the south of Stewart Island." (A far greater vegetative gap, by the way, than exists in the British Isles.) "(2) Representations on a fairly large scale of the leading plant associations of the land as they existed in primeval New Zealand. (3) The horticultural use that can be made of the plants most suitable for that purpose. (4) The restoration of the present forest to what it was. Thus the scheme is four-sided, and concerns the flora, the vegetation, the horticultural use of New Zealand plants, and the restoration of the forest."

This seems to cover the work of an open-air museum perfectly, so much so that it is worthy of the attention of all who are interested in our native flora. That something must be done is obvious to all. The difficulty lies in knowing how best to do it. Have readers any suggestions?

E. H. M. C.

PORTION OF A FINE CLUMP OF DRYAS OCTOPETALA.

DRYAS OCTOPETALA is one of the dwarf shrubs of the rock garden that might be far more often seen. In fact, it is always a surprise to those who have it and love it why their neighbours do not also grow it in their gardens. Perhaps it is because Dryas octopetala is found on the Scottish hills, and native plants are all supposedly miffy in gardens. Here, however, we have an exception, for this dryas is easily grown. It is a carpeting shrub with little oak-like foliage and large creamy white flowers. It will succeed in any good soil and should have nearly full exposure. If the soil is too heavy it is all the better for a portion of sharp sand and gravel chips to open it up. There it will spread and flower throughout June and July and sometimes into August, with no attention other than an occasional top-dressing of fine leaf-mould. Try Dryas octopetala.

IN this week's issue is the first of a series of illustrated articles on Nursery Gardens of the British Isles. The excellent habit of gardeners visiting nurseries is increasing rapidly. By this means they can judge the individual merits of species and varieties of whatever they happen to be interested in. They can also realise better the specialities of the various firms and see for themselves under what conditions and in what soils plants flourish to the best advantage. It is realised that many gardeners are unable, owing to distance, to visit all the nurseries that they would like to, and it is in order to give them some idea of the ground that firms cover that these articles are written.

THE DAFFODIL SEASON OF 1926

LET us try to recall some of the peculiarities of the past season and revive our memories of the beautiful things brought to our notice, some for the first time, may be, others, though no longer regarded as novelties, but still in the forefront as varieties of sterling value. Firstly, then, as to the season. With us in the Midlands it was about the earliest I can remember, and one of the longest, as the last part was just as cold and dull as the fore part was sunny and warm. I cut quite a good little lot from the open for the R.H.S. meeting on March 23rd, which is extremely early for this district, and there were still fresh flowers of the late poets left on May 3rd. Some of the earliest were two cyclamineus seedlings, February Gold and March Sunshine, nice little things for rock gardens; Brilliancy, the yellow Barrii with red edged cup; The Star, a well formed yellow incomp.; Le Printemps and Waterloo, very early yellow trumpets—cousins, but quite distinct; and Alice Knights, a very early white trumpet. There must have been more, but memory fails me.

The following are all of moderate value, and all are particularly good in pots:

Trumpets.—Phantasy, a pale bicolor which comes quite white under glass, a most lovely flower, carried on long stalks. General Townsend, a much improved Lord Roberts. Florence Pearson, a pale bicolor of large size, very fine in pots. Van Waveren's Giant, a huge flower, somewhat in the style of Emperor. King Alfred, one that takes a lot of beating, a lovely golden yellow of perfect proportions. Le Printemps, a very early yellow, the great attraction in this flower is the fine open trumpet, with beautifully reflexed and serrated brim. Thorkel, a giant in the way of Emperor. Mrs. R. Sydenham, an exquisite white trumpet, better in pots than when grown in the open. White Knight, another beautiful white. Refined Gold, a rather small flower of a uniform luminous golden yellow, a great flower to last. Wm. de Graaff, now very well known, but still ranks high on account of its perfectly formed flowers, which come quite white under glass. W. P. Milner, a very small sulphur coloured flower, passing to white, a lovely little thing for bowls (in fibre), pots or shallow pans.

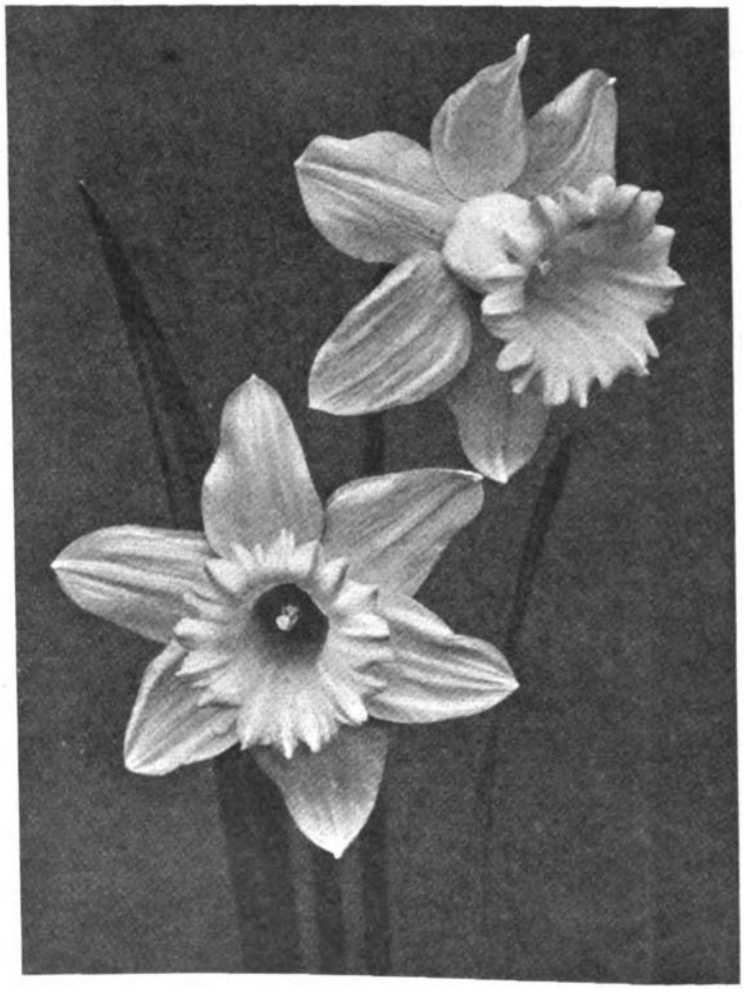
Giant Leedsii.—Empire, a grand flower of large size, very free—I counted fourteen flowers on one bulb one season. Vega, a graceful flower and very prolific. Hon. Mrs. J. L. Francklin, a flower of perfect form and balance and very lasting. Capella, a neat little flower, in form like a small trumpet daffodil. Louise L. Linton, under glass the cup of this variety often comes with a beautiful tint of apricot.

Incomps.—Bernardino, white perianth and large cup, more or less stained with orange, a lovely flower, but at times rather disappointing, as there is very little colour in the cup—the colour in red-cupped daffodils always comes better in dull weather. Kivasind, a giant in this section, the segments, which are long and narrow are rather reflexed, giving great character to the bloom. Pedestal, quite an exhibition flower, the perianth and cup being both of very regular form. Whitewell, a very good late thing, but not easy to flower well inside. Marshlight, a much improved Lucifer, the cup of a very brilliant red. Lucifer, a great favourite, with white segments, and orange red cup, very lasting, though it looks rather frail. Sunrise, a very bright flower with bright orange cup, some of the colour spreads to the white perianth, giving a very distinct effect.

Barrii.—Brilliancy, a very early flower, with bright yellow perianth, and cup edged with brilliant red, a very showy flower and a good laster if cut young. Firebrand, a small flower, but it has a very deep red cup.

Doubles.—Personally I am not fond of doubles, but some of the more modern ones, raised by Mr. Engleheart and Mr. Copeland, are vast improvements upon the old things, such as Sulphur and Orange Phœnix, which all had very poor stalks, unable to support the heavy blooms. The modern breed all have really good stalks, which will withstand even rough winds. Argent is one of these newer varieties; it is not fully double, but is a very decorative flower. The Pearl, is a very soft and pale yellow, very pretty.

Small Leedsii.—This section is not one of the best for pot work, but Fairy Queen and Evangeline are both dainty and pretty. The jonquil Odorus rugulosus is a lovely bit of golden yellow; it has narrow, rush-like leaves and there are often two or three flowers on a stalk. A very lasting flower.



KING ALFRED, ONE OF THE FINEST OF ALL DAFFODILS.

FINE FLOWERS FROM THE OPEN.

Fortune, the new giant incomp., a really wonderful flower, large size, perfect shape. The perianth is rich yellow and the large cup is deeply stained orange. Very early, a strong grower and rapid increaser, but at present rather prohibitive in price. King Alfred, too well known to need description. Potentate, a huge clear yellow trumpet daffodil better for the garden than as a cut flower, very strong grower. The Don, one of the best of the bicolor trumpets, a very regular flower. Beersheba, the finest of all white trumpets. Tenedos, a giant in the Leedsii section, very distinct, and a great doer. Lucinius, a fine giant incomp., a very good exhibition variety. Hymettus and Mitylene, two giant Leedsii of great beauty and very distinct. Rosary, a white trumpet with a distinct shade of pink in the trumpet. Louis Mountbatten, a white trumpet of enormous size and very long stalk. Gertie Miller, a giant among the giant Leedsii, the flower is some 6ins. across and the cup 3ins., not a coarse flower, but inclining to be a bit over-big.

Poets.—Striking, a well formed pure white perianth and eye of brightest red. Jno. Masefield, a very beautiful poet with well rounded perianth and very large red eye. Rupert Brooke, a well formed flower with bright eye, the great feature of this variety is its great vigour; it is one of the very strongest growers

Digitized by Google

and produces a great crop of bloom. Snow King, one of the very largest of the newer poets, long stalked and late flowering.

Bulwark, a very fine all-yellow trumpet daffodil. Crœsus, a choice incomp. with orange cup. Moira O'Neill, one of the very best bicolor trumpets, a fine show flower. Golden Pedestal, one of the best giant incomps yet sent out. Jubilant, another fine giant incomp. White Nile, a very attractive giant Leedsii. Feu de Joie, one of the best of the new doubles. Firetail, the best of the red-eyed Barrii. Glorious, a beautiful poetaz, pure white perianth and brilliant orange cup. Zillah, a large incomp., white perianth and large yellow cup, deeply edged with red, very late flowering. Mary Copeland, perhaps the finest double in existence. Sanctity, a very beautiful all white giant Leedsii. Tresserve, a very fine all-yellow trumpet daffodil. Hera, a delicate beauty of the Leedsii section, in size half way between the small flowers and the giants; a beautiful well balanced flower on long stem, late. Lady Mine, this is a very clean looking bicolor trumpet, it was picked out by the late Rev. Jacob at one of the Midland daffodil shows and he found a name for it.

The above list does not half exhaust the good things displayed at the April meetings at Vincent Square this season, but will, I think, be enough for most amateurs to study. J. D. PEARSON.

PTEROCARYAS OR WING-NUTS

BY E. H. WILSON.
Arnold Arboretum.

NEVER in history were gardens so rich in hardy plant material as in the present, and among this wealth are not a few trees of more than passing value. Compared with shrubs, trees are slow in setting forth their real qualities, and, in an age so impatient as this, they are apt to get thrust aside and lost sight of. Owners of such trees are often in need of more information about them, and photographs showing their adult appearance would foster interest and dispel the fog of obscurity which so often enshrouds new trees.

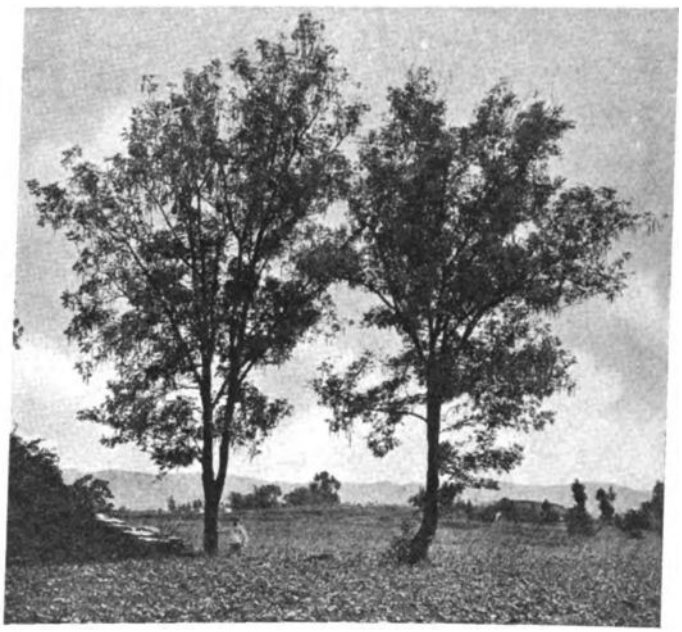
Among the several excellent articles in the last Journal of the Royal Horticultural Society is one on Pterocaryas and Zelkovas, by the Hon. Vicary Gibbs, of more than usual interest to tree lovers. What is grown at Aldenham House could and should be grown in many other gardens in Great Britain and Ireland. As a supplement to Mr. Gibbs' valuable observations and deductions, it is thought that a few notes, accompanied by illustrations of certain of these trees in adult conditions, would be acceptable to readers of THE GARDEN.

Of the pterocaryas mentioned by Mr. Gibbs four can be grown in the Arnold Arboretum, but only two of these are properly hardy. The Japanese P. rhoifolia is the only species really hardy here. This is a fine tree which occurs scattered through the forests of Japan as far north as Hokkaido, flourishing in cool, rich woodland soils. In general appearance this pterocarya resembles Juglans Sieboldiana, often found growing in associationship. It has grey, fairly smooth bark, and a rather broad crown of thick horizontally disposed branches. Trees from 60ft. to 75ft. high are the rule, each with a clean trunk from 6ft. to 8ft. in girth. The leaves are from 8ins. to 12ins. long and from 4ins. to 6ins. wide. The wood is of some value in Japan, being light, straight-grained, soft and white. In the Nikko region large and handsome specimens may be seen, but nowhere did I find it to be a common tree.

Throughout the temperate parts of China, and particularly the valley of the Yangtsze River, there is no more common tree than Pterocarya stenoptera, or Liu-shu. Especially partial to river banks, it is the first tree to spring up on alluvial flats and islands in the rivers. At its best the Liu-shu is a tree 90ft. tall with a trunk 20ft. in girth clothed with fissured grey bark, and an irregular crown of spreading branches. It suckers freely and often forms thickets. With its ash-like foliage and long pendent racemose fruits, it is a commanding tree in the landscape. In Shanghai, where it is called the Chinese ash, it is much used as a street tree, and, growing rapidly and standing pruning well, it has proved very serviceable. The wood is brittle and of no value except as fuel. I had hoped, from seeds collected at its altitudinal limits, to secure a type hardy in the Arnold Arboretum, but in this have been disappointed. It just exists with us, and so, too, does the Caucasian pterocarya.

The natural hybrid between these two species (P. Rehderiana) is, however, perfectly hardy, and we boast a fine grove of this tree. It was raised here from seeds received from Segrez Arboretum in 1879. The trees are now 55ft. tall, divided from the ground into a nest of trunks, the largest 6ft. in girth, and the crowns are wide-spreading. They sucker

PTEROCARYA RHOIFOLIA ON RIGHT, CERCIDIPHYLLUM JAPONICUM ON LEFT.



PTEROCARYA STENOPTERA, SIXTY FEET TALL, IN FULL FRUIT.

Digitized by Google

freely, and if left alone would soon form a copse. This hybrid is intermediate in size of fruit and leaf, but far hardier than either of its parents. With us it is happy in moist situations on the edge of oak woods.

The two other pterocaryas introduced from China by me (P. hupehensis and P. Paliurus) are both partial to the sides of forest and woodland streams. There is no apparent reason why they should not grow freely under cultivation, and they ought to be hardier than the low-level P. stenoptera. Both are fine trees and the circular flattened fruits of P. Paliurus, each often 3ins. across, strung one below another in string-like hanging racemes, are very remarkable. It is a disappointment to me that we have failed with these trees in the Arnold Arboretum.

NOTES OF THE WEEK

IRIS UNGUICULARIS.

ONE if not *the* most lovely of winter-flowering plants is the Algerian iris unguicularis, or I. stylosa, a name by which it is still known in many gardens. It begins to push up a few blooms towards the end of October, and during December and January quite a crop can be gathered. The illustration was taken by Mr. M. Moulton, O.B.E., on January 12th in the interesting gardens of Mr. D. C. Lysaght, St. Pierre, Chepstow, Mon. It is one of several fine clumps, growing in the spacious kitchen garden. There are several varieties of I. unguicularis, the typical plant bearing

IRIS UNGUICULARIS TAKEN IN A MONMOUTHSHIRE GARDEN IN JANUARY.

light lavender blue flowers, while the form known as alba is white, though a poor thing when compared with the type. Other good varieties are Elizabethæ and angustifolia, and the excellent form illustrated is probably near the latter.

All the varieties of this beautiful iris enjoy a hot position, and probably the best place is at the base of a south wall. A sandy loam is a good rooting medium, and care should be taken to see that the roots do not suffer from drought during the growing season. It ought to be borne in mind that plants growing at the base of a wall facing south often become dry, while other plants in the open are fairly moist.

Regarding the treatment of this fine iris, there is a diversity of opinion, and many advocate that once planted they should be left undisturbed for years, but I am inclined to believe that the plants should be lifted every fourth year. The roots are divided and the pieces replanted about a foot apart. Starved, overcrowded plants do not produce such fine quality flowers as those afforded more generous treatment.

Spring is often quoted as the best time to plant new beds or lift and divide existing clumps, but I do not entirely agree with this view. I have tried March and April and September, and from results obtained have a strong bias in favour of the latter month. Early in September new roots are made, and they quickly take possession of the warm soil at that season. With April planting there is the risk of a dry month following, and a certain amount of watering would be necessary, but, given a showery April and a dripping, warm May, no doubt there is a lot to be said in favour of spring planting.

Although a winter-blooming subject, the open flowers are easily injured by frosts, so it is a profitable plan to pick them when in bud, as they will fully develop in a warm room or greenhouse.—T. W. B.

A LATE-FLOWERING NERINE.

ONE has only to inspect a few greenhouses at the end of the year to see that there is little or no colour about. In a few weeks time we shall have the early bulbs with us, such as hyacinths. But it is in December that we need something to fill the gap. Everyone knows the great usefulness of nerines in September, October and November; they throw their dazzling flower spikes in these dreary months. There is one, however, that flowers right through December—one may even have it in flower for Christmas. This particular nerine is N. Manselli. I saw a group of this fine bulb last winter in the glass-houses of a leading grower. Several were in full flower and some were still in bud. The one in bud was in full bloom for some time after Christmas. Nerine Manselli is a handsome, tall and robust variety. *It flowers when in full leaf*—a great acquisition. The flowers are of a rich rosy cerise, and the inflorescence is borne on the end of a tall stem, perhaps 18ins. high. The culture is extremely simple, and in all ways N. Manselli is treated exactly as the earlier flowering varieties.—J. BIRKENTALL.

MUSCARI AZUREUM.

THIS little hyacinth, which closely resembles a grape hyacinth, differing mainly in the mouths of the flowers not being closed, is very precious to those of us who spend our winters and early springs at home and who welcome with joy the earliest flowers of the year. This year snowdrops were a little late, and this azure hyacinth came into flower soon after the earliest of these, and was in bloom by mid-February. It usually accompanies the snowdrop and the snowflake as we enter into the days of March. It is a native of Asia Minor, and has been in cultivation in this country for a number of years, but is not at all plentiful in gardens, although now comparatively cheap. Were it available in quantity, it would be charming in the grass, associated with snowdrops, with the symmetrical cones of azure blue flowers mingling with the chaste drooping bells of the "early herald of the infant year." But in smaller quantity it is a welcome denizen of the front of the border or seen in clumps in the rock garden. It is a little surprising to the writer to find that a high authority speaks of it as often injured by frosts in the open air. I have grown it in south of Scotland gardens for upwards of twenty years, and have never known it injured by frost in all that time. It has 4in. to 6in. long strap-shaped leaves and dense conical spikes of azure blue flowers rising above the leaves. It thrives well in a gritty loam, but is not fastidious, as I have it at present in flower in a rather stiff loam. The variety amphibolis, which is not easily obtained true to name, is about 6ins. high and has paler blue flowers, about fifty in a spike. Two other varieties, giganteus and robustus, do not appear to be at present in commerce. I can find no record of a white variety, but it is quite probable that such is in existence. Plant in early autumn about 2ins. deep.—S. ARNOTT.

GARDEN PRODUCE.

How to Pack for a Journey.

GARDEN produce for despatch by road or rail should be gathered in the morning—say, between 6 a.m. and 8 a.m. Fruit must, of course, be gathered dry, but vegetables are always more crisp when they are gathered before the dew rises.

Vegetables will be in better condition at the end of their journey, if packed among some freshly-cut grass, moist with dew. It is astonishing how many vegetables, etc., find their way to market in anything but a fresh condition. With a little care it would be quite easy to obtain a supply of vegetables in a fresh and crisp condition.

If vegetables are being forwarded by road or rail, they should be gathered as indicated and packed into hampers or baskets among freshly-cut grass or dew-wet cabbage leaves, etc. Packing material should always be cool and damp. It should be of sufficient quantity to prevent the vegetables moving about. If properly packed, the consignment should reach its destination in a fresh and crisp state.

Digitized by Google

Flowers travel very well packed into tin boxes. They should be picked in the early morning before the dew is off. Roses, etc., if cut during a hot, sunny day, soon wilt and fade. It is always a good plan to stand the flowers for a little in water before packing. Tie them up into bunches with a bit of oiled paper round their stems. Do not crush too many flowers into one box, but see that they are made firm at the stems with the packing material rammed hard at the bottom of the box. If packed thus, the tops will be free and loose, and yet securely held so as to prevent damage to the fine blooms during transit. Wet moss is one of the finest materials for the packing of flowers.—JOHN WIGHT, *Balthangie, Turriff, Aberdeen.*

SOME CHOICE SCABIOUS.

FEW would question the placing of Scabiosa caucasica at the head of the list of all the "pincushion flowers." It is an easy first not only among its own kind, but some have gone so far as to give it a premier position over all border perennials. However that may be, its large, broadly frilled heads of pale blue, lavender, violet, heliotrope, white and other shades are remarkably beautiful. Moreover, they appear quite early in spring and a succession is maintained practically throughout the season. In the poor, stony soil of my garden this lovely scabious is quite permanent, and all it gets is an occasional sprinkling of finely crushed mortar. S. caucasica undoubtedly dislikes being moved. It is best raised from seed, and I find it likes to be planted just when growth is commencing in spring.

S. graminifolia is a rock garden species of much merit, hailing from the more southerly Alps. It makes cushiony mats of long, grassy leaves, pale green and silvery, and over these to a height of some 10ins. are borne all summer the rosy lavender blossoms which seem to blend so harmoniously with the glimmer of the silky foliage. S. Pterocephala is the more familiar trailing plant, making close masses of foliage which might belong to some silvered Dryas octopetala, and upon which the big pink pincushions squat throughout the later summer. Both of these ask for a really dry, sunny ledge, preferably with lime. Winter wet is their chief trouble, but they generally survive this, even here in the humid west. Like conditions will suit S. Webbiana, which adorns its tidy little cushions of crinkly, silvery foliage with creamy yellow flowers in the comparatively dull days of August.

A native species which deserves to be better known and which is well worth a place in the rock garden (especially in those localities where it is rare) is S. Columbaria. This is a limestone plant with pale green, dentated leaves and comparatively broad, radiate flower-heads of a soft lavender.—A. T. J., *N. Wales.*

THE FINE SCABIOSA CAUCASICA.

FRITILLARIA ELWESII.

MOST of the dim-coloured fritillaries suggest putrefaction too successfully in scent and colour to be very eagerly sought after for the flower garden, but F. Elwesii, although it belongs frankly to this class, has the charm of unusual colour and design to recommend it.

The inner segments are deep, chocolate-purple and the outer ones are of the same colour, but with a broad band of clear apple green down the centre, so that the general effect of the flower is a bold design of broad stripes in black and green, very different from the usual chequered pattern of the genus,

FRITILLARIA ELWESII OF CURIOUS COLORATION.

which here appears only in the dirty waxen yellow of the interior of the bell.

The plant was introduced into cultivation by the late Mr. Elwes, who found it in mountain woods in Caria, but it was figured in the Botanical Magazine in 1875 (No. 6321), under the name F. acmopetala.

The plant shown in the illustration was collected (out of flower) from the upper, grassy slopes of Mount Tsukali in Northern Albania; it seems quite happy and hardy here in rather heavy soil and full sun.—F. A. HAMPTON, *Chesham Bois.*

LEPTOSPERMUMS.

Good Shrubs for Light Soils.

ONE cannot help thinking that when they are given further trial and become better known the South Sea myrtles will enjoy a wide popularity. Their tenderness, or assumed tenderness, now undoubtedly stands in the way of their progress, but when I say that specimens of various kinds, and standing right in the open, were unharmed by 20° of frost last winter, and that for considerable periods, I think one can safely say that they are fairly trustworthy. But there seems no doubt that a light soil is essential, and these are shrubs which delight in an open, breezy situation. For sea-coast gardens they ought to be admirable subjects.

LEPTOSPERMUM SCOPARIUM CHAPMANNII.

The average height of these New Zealand and Australian shrubs is probably about 8ft., but they grow rapidly and in favoured places will reach three times that stature. They are upright and close in habit, the slender branches being densely furnished with a small heathy foliage, which is generally suffused with a bronzy tint in the white varieties, while that of the crimson is a rich plum purple. The flowers, about the size of those of hawthorn, to which they bear a general resemblance, are produced in extraordinary abundance, the whole of the older branches often being heavily clustered with bloom. Seed is set freely, and this germinates quite easily, but to ensure fidelity to type propagation should be carried out by cuttings, these striking readily in a cold frame in August.

While I do not presume to unravel the mysteries of the nomenclature of this genus, L. scoparium appears to be the same thing as L. bullatum, and it has pure white flowers with a dark purple eye. In L. s. Boscaweni the blooms are similar, but for the crimson flush which infuses the petals and the rather more bronzy foliage. Between the two ruby crimson forms, L. s. Nicholli and L. s. Chapmanii, I cannot discern a great deal of difference. Both are remarkably beautiful at any season, but when their plum-coloured foliage is almost smothered by a profusion of the brilliantly coloured flowers they can hold their own with anything in the garden of early summer. In all of these and allied varieties the flowering season often extends for fully six weeks.

Commencing to bloom earlier and lasting longer is the Australian species, L. lævigatum. This I have found quite as hardy as the others, and though its white, purple-centred flowers are a good deal smaller, they appear in such multitudes on the besom-like twigs that the effect is decidedly charming. Another species growing here is L. stellulata, said to be a Tasmanian. Though as yet only 2–3ft. high, it has flowered freely, the blooms being white, about one-third of an inch across and centred with bright green. This has broader and larger leaves than any other leptospermum mentioned, so that this foliage, which is a vivid glossy green, is a very distinctive feature of this little bush.—WALES.

THE SEASON OF FLOWER SHOWS

FROM midsummer onwards, for several weeks, almost every town and village will be having its flower show, the most important of these exhibitions being that held at Shrewsbury in August, which is run in connection with a musical and amusement fête of gigantic proportions and attracts both the aristocracy and democracy, who flock to Salopia's capital in tens of thousands once a year for the purpose of feasting their eyes in admiration on a group of plants or a collection of fruit, or of watching the horse-leaping contests or the feats of some of the world's renowned acrobats and jugglers.

Town shows and country shows, of course, occupy a somewhat different plane. Shrewsbury, for instance, excites professional rivalry in floral exotics, and the greatest in the land send collections of fruit, vegetables and flowers for competition. The country show, on the other hand, is for the most part content with a development of the old-time simplicities; it exhibits very few departures from what may be described as the natural state of things, but somehow or other the annual flower show seems to be an essential part of village life.

Actually, the more winning and rural a place is, the more industrious, thrifty, and contented its inhabitants, the greater need is there of an annual show to demonstrate to the outside world what its folk are capable of producing within the narrow compass of their own pales or at the allotment after regular hours of labour.

Sometimes amateur gardeners who have excellent material for exhibition fail to win prizes, being unable to appreciate that the manner in which they have set out their produce is at fault. A study of the way in which the exhibits of professional gardeners are displayed will serve to help them rectify their mistakes. Good method of display is important; it may influence the award of prizes in favour of an exhibit which is rivalled by another of even merit but of indifferent arrangement. An exhibitor will be surprised at the effect he secures when he sets out, say, vegetables on a board covered with black velvet which shows the specimens to excellent advantage. Many who are anxious to compete in the table decoration classes at flower shows are debarred from doing so simply because they have no idea what flowers to use.

Roses, sweet peas (with gypsophila) or Shirley poppies can be employed in very successful arrangements. A point to bear in mind with regard to roses is to choose those of one colour only and to avoid using too many blooms. Crystal glass vases and bowls make the most satisfactory setting. The best time to cut the flowers is the early morning, before the sun has dried the dew, and to plunge them immediately up to the very top of the stems in water, keeping them in a cool, shady place. When packing flowers for travelling to a show it is best to put them with their stalks all pointing in one direction. In the case of pot plants, not an insect or particle of dust should be allowed to remain, and to this end syringing, sponging and placing them outside in gentle showers are the chief means to be adopted. An inch of soil carefully removed from the surface of the pots and replaced with nice potted manure is an excellent way of promoting the vigour of the plants. Soot water will also be found a good stimulant, not only deepening the tints of the foliage, but brightening the colour of the flowers. The plants should be thoroughly watered on the night previous to the show, and again in the morning before they are taken from home, and when placed on the exhibition stage the pots must be quite clean.

R. D.

A SELECTION OF GENTIANS

THESE notes are the result of personal observation on gentians growing in my garden. I have treated species individually instead of in groups.

GENTIANA ACAULIS.—This species forms a dense carpet of compact tufts of glossy green leaves, from which rise large tubular deep blue flowers. It is, however, very uncertain in cultivation; in some places it will grow and flower freely without the least trouble: in others, no amount of care will make it flower. I tried for two or three years to grow this gentian in my garden on the east coast, but, while it grew fairly well, it refused to flower. I, therefore, lifted the whole clumps in early spring when growth had started and divided these up into small pieces, potted them up and kept them in a cold frame for six weeks. I then planted them in my garden in Perthshire, and the following year nearly every plant flowered. They were planted behind a stone edging to a shrubbery, and now form a border about 18ins. wide, being one mass of bloom in early June. They are growing in the natural soil. This is rather stony—which keeps it well drained—but has no limestone or gravel, which is usually recommended, mixed with the soil. I find it requires to be planted fairly deep and as firmly as possible. The stone edging helps to keep the roots cool during the summer. This species seeds very freely, but, as it takes from three to four years to make good flowering plants from seed, I find it much quicker to propagate it by division.

G. ALPINA.—Is very nearly akin to G. acaulis, but the flowers are smaller and shorter in the stem. It requires the same treatment as G. acaulis.

G. ARETHUSÆ.—This is another of the late-flowering species, and a very pretty plant. The leaves are in whorls of five, the stems forming a denser mass than either G. Farreri or G. sino-ornata. The flowering stems are 6ins. to 8ins. long. The flowers, each poising singly at the end of the whorled foliaged stems that spring from the crown, are fully 1½ins. long, and the six-lobed corolla is ¾in. wide, the blue trumpets lined darker on the outside are a deeper shade of blue than G. Farreri. The flowering stems die back in the winter, as in G. Farreri, and do not root at the nodes like G. sino-ornata. The young growth of this species is more like a sedum than a gentian. I find this gentian also seeds freely.

G. ASCLEPIADEA, known as the willow gentian, is a tall-growing species, reaching nearly 3ft., and flowering in August. It is a native of the Alps, but is rather variable grown from seed, the colour in some flowers being much better than in others. This species has dark oval pointed leaves, and bears numerous large deep blue flowers on willow-like spikes. There is a white form which is rather handsome. It grows well in any cool garden soil and sets a very large quantity of seed, and I find seedlings coming up in great quantity in its vicinity in soil that has not been dug. It makes a pretty plant to naturalise in thin woodlands, where it sows itself.

G. CRINITA (fringed gentian) is a native of North America and somewhat like G. detonsa. It is a biennial, growing 1ft. to 2ft. high, flowering in September. Its blue fringed flowers are produced on long peduncles from the axils of the leaves. The corolla has four lobes and sets seed freely.

G. CRUCIATA is a native of the Alps and is very easy and vigorous in any sunny garden soil. It is one of the prettiest of the large-leaved species, with clustered heads of four-lobed little dark blue flowers (flowering in August), on leafy stems about 9ins. high. It is also a free seeder, and makes good flowering plants in three years from sowing the seed.

G. DETONSA.—This rather attractive species—a native of northern Kashmir—at 9,000ft. to 15,000ft. altitude—is, unfortunately, monocarpic, and in consequence it is necessary to sow seed annually to keep up a succession of flowering plants. It grows from 15ins. to 24ins. high and is of a loose habit, producing its flowers on long peduncles 3ins. to 8ins. long from the axils of the leaves. The flowers are four-lobed, fimbriate, an inch or more in diameter, and dark blue in colour. It sets seed very freely, and no difficulty should be experienced in growing this species. It likes a moist sunny position, and flowers during August.

G. FARRERI.—We are indebted to the late Reginald Farrer for introducing this lovely gentian to gardens in this country. The seed was collected by him on the Ardjeri Alps in 1914. From this seed plants were raised in the Royal Botanic Garden, Edinburgh, and flowered in 1916. Coming from an altitude of over 10,000ft. it is quite hardy in this country. The wonderful sheen of the blue of the petals and folds above

Digitized by Google

the white throat is its outstanding flower feature, and the recurving of the corolla shows off the colour to advantage. It begins to flower in late August and continues till cut down by frost. I do not find this species has rooting stolons as in G. sino-ornata, and with me it does not form new axillary rosettes at the nodes. It therefore does not increase nearly so quickly as G. sino-ornata. The flowering shoots are from 6ins. to 9ins. long, some of them having as many as six flowers on a stem, the one at the apex opening first.

to put away till the spring. If this seed is sown at the end of February the following year, it germinates very quickly. The seed is very fine and should be sown thinly on the surface of the seed pot and should germinate in ten to fourteen days. When large enough to handle, they should be pricked out into boxes and kept in heat till about the end of April, when they are placed in a cold frame to harden off.

I plant them in their permanent position about the end of July, and before the winter they have made good

flowers in August, is an easy grower, and sets large quantities of seed, like the other varieties of this species.

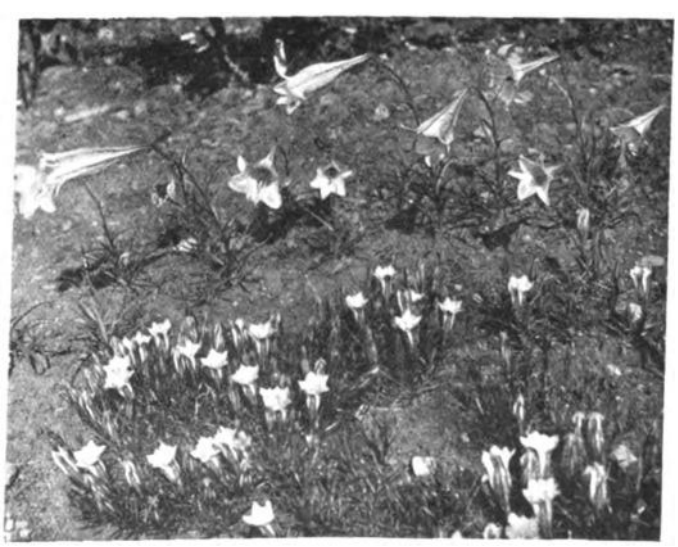
G. FRŒLICHII forms small clumps of two or three crowns of narrow grooved leaves, not unlike the growth of Dianthus alpinus, and flowers on stems about 2ins. high, carrying a flower of pale blue colour, fading to yellow at the base, spotted at the throat. This species flowers in August, and thrives with me in a rather damp soil in full sun.

G. KURROO VAR. BRIVIDENS is a native of the western Himalayas, growing

THE BLUE TRUMPETS OF THE LATE FLOWERING G. ARETHUSÆ.

THE EASY GROWN G. LAGODECHIANA.

G. CRUCIATA IS ONE OF THE BEST LARGE-LEAVED SPECIES.



HEALTHY PLANTS OF THE MAGNIFICENT G. FARRERI.

This gentian ripens a large quantity of seed, which it does very quickly after the flowers fade; but to secure it careful watching is required, as after the flower begins to fade the pistil lengthens and protrudes through the faded flower, the mouth of the capsule gapes open and the seed is apt to fall out before you discover it. I find it a good plan to open the faded flowers and, if the seed capsules are beginning to turn a brown colour, to cut them off, and if left in the sun for a day or two the seeds ripen and dry, ready

growth, most of them flowering, the following September.

G. Farreri with me is the first of the late-flowering gentians to start into growth in the spring, and is perfectly hardy. I have seen it come through 10 to 15 degrees of frost, after it had made young growth of about 2ins., without the least harm to the plants.

G. FREYNIANA is, I believe, another form of G. septemfida, making tufts of shoots clad in pairs of dark glossy leaves of about 6ins. high, with two or three brilliant bells of bright blue. It

at 5,000ft. to 8,000ft. The delicate azure blue of the limbs of the corolla, sprinkled in the throat of the tube with pearly white, makes a notable feature. My plants of this species are only two years old and therefore have not flowered, but I hope to see them flower next season.

G. LAGODECHIANA is a dwarf form of G. septemfida, but the flowers are of a deeper blue, and it has a distinctly prostrate habit. Both of these varieties grow well in any good garden soil.

A. HARLEY.

(To be continued).

CORRESPONDENCE

THE PROTECTION OF WILD FLOWERS.

SIR,—Since writing to you some weeks ago on the urgent necessity of wild flower preservation, I have received a number of communications, both oral and written, on the desirability of prompt and effective measures.

There appears to be a general concensus of opinion that the depredations of gipsy hawkers, if not speedily checked, are liable to convert the countryside into a sort of wilderness, where the common primrose even may be counted a rarity.

Simple legislation making it an offence to sell the rooted plants of wild flowers—putting, if you will, the onus of proof on the vendor to show that the plants offered for sale were cultivated plants and not the wild article—should be easy to pass and simple to enforce.

There still remains the problem of the rarer flora. Here, legislation would appear to be ineffective. A rare bird, seen in a named district, has a poor expectation of life. A *soi-disant* "collector," or "sportsman," can generally be found to blow it up with his gun. With a rare plant the odds are even worse.

Only the other day it was brought to my notice that an enthusiastic school teacher was caught trespassing with uprooted specimens of an extremely rare local plant that she had "collected" on the ground that none of her pupils had ever seen the plant or its root! The only measures of protection that seem to be at all practicable consist, in my opinion, is the formation of a society calling themselves "Friends of the Flowers," "Flower Wardens" or some similar and suitable title. The objects of its members would primarily be to preserve rare flowers in their respective localities from destruction, to keep their habitat secret save for the governing body of the society, who would, if invited to do so, give such advice as was available for the cultivation and propagation of these rare species under garden conditions in the locality — in the hope that some gardening enthusiast, possessing what the Irishman describes as "the green thumb," might be successful in cultivating a stock, whereupon some of the casualities might be replaced. It is a truism that most of the rare species are difficult, if they were not they would probably be common. At the same time, the difficulties are not insuperable, and where A, B and C fail, D sometimes comes along with a different method and succeeds. It might be worth trying.—CUTHBERT JAMES, *House of Commons*.

THE TOPS OF WALLS.

SIR,—I was much interested in reading the note on this subject by "M. J. D.," page 399, issue July 10th. There are, as your correspondent says, many ways of beautifying a wall. An old structure lends itself to such treatment better than a new one. I would neither use wood nor any glass on a wall that is to be furnished with plants, as the latter soon overgrow the glass at the edges and then it becomes a danger and a nuisance to everyone that attends to the plants. It is much better to fix half and three-quarter length bricks, or stones in the case of stone-built walls, so that nearly two-thirds project from the sides, leaving a space for the soil.

It is nearly forty years since I saw the top of an old wall so treated and planted. I saw again the wall recently and was much surprised at the great success of many of the original plants on it. Some of them were specimens 3ft. across and nearly as high. There was scarcely any soil around the roots, which had a firm general grip upon the wall. Rock roses and several kinds of flowering shrubs were a mass of lovely blossom. The plants were never watered, nor did they require it after being once established. Of course, there is a good representative collection of plants on the wall in question, including sedums and saxifrages. The two last named and similar kinds seem more in place on quite new brick walls at first. Pinks, Dianthus plumarius annulatus hybrids, cistuses, Nepeta Mussini, Cerastium pennsylvanicum, Saxifraga umbrosa, thyme, Silene acaulis, Erinus alpinus, campanulas, veronicas, with the sedums and saxifrages, will soon furnish the top of a wall, new or old, if firmly fixed in a little good fibrous-holding soil at first.—GEORGE GARNER.

A SKY BLUE POPPY.

SIR,—I enclose an illustration of Meconopsis Baileyi, Ward's No. 5784, which is in flower just now in my garden in Perthshire. The plants were raised from seed last year and planted out last June, and the first flowers opened about a month ago. It has the same habit of growth as Meconopsis grandis,

A SKY-BLUE POPPY.

and, to all appearance, is going to be a perennial. The flowers have four petals, sky blue and golden stamens. The flower stalks are about 30ins. high, bearing from four to five flowers on each stem. These plants are growing in a shady position facing north, in front of rhododendrons.—A. HARLEY, *Kirkcaldy*.

IVY ON TREES.

SIR,—Referring to the correspondence on this subject, last summer an old man was employed four half-days a week cutting it from oak and ash trees in a coppice of a hundred acres. It took him the whole summer.

The following list of trees attacked, with some remarks as to its growth upon them, may be of interest:

Oak.—Grows freely on it. Has a large hold on mature trees where it has not been checked. Has reached the flowering stage upon them.

Lime.—Thick on the trunk of mature tree, had not spread to branches or flowered. Not noticeable on many lime trees.

Beech.—Growing thinly to about 20ft. on mature tree. Beech seems almost immune from attack.

Ash.—Thick on some young trees of about twenty-five years' growth. Was spreading to branches of mature tree when it was cut.

Willow.—Grows freely to flowering stage upon it, covering trunk and branches.

Poplar and *Alder*.—Same as willow.

Silver Birch.—Fairly thick on trunk. Not so frequently attacked.

Horse Chestnut.—Thick, though not to flowering stage, on trunk and branches of mature tree.

Holly.—Grows very freely on mature and young bushes where it has not been checked.

Sycamore.—Fairly thick, not to flowering stage.

Scots Fir.—Thick on mature trees. Isolated specimens.

Spruce.—Has killed several in the corner of an ornamental plantation and seems to attack them readily where they are growing among other trees.

Lawsoniana.—Thick, almost smothering them.

Yew.—Thinly covering old tree to the top.

Cedar.—Had made a start on several and been checked.

Larch.—Was getting a good hold on outer rows of young trees in a plantation some thirty years old. Has been kept in check.

Douglas.—Thin. Has been kept in check.

Stone Pine and *Weymouth Pine*.—These were isolated specimens. The ivy had attacked them and been checked.

This list is chiefly compiled from observations made in an old shrubbery where the ivy is thick on the ground and where it had not been touched, except here and there to prevent it overcoming young trees.

In mixed plantations it seems to attack conifers readily. Where they are planted alone or are the predominating trees, it does not penetrate very far. Naturally, it is most troublesome in the outer rows of all plantations. It has a liking for the water, and poplars, alders and willows growing along a brook are almost smothered with it.—(Mrs.) E. L. MASON, *Cressage, Shropshire*.

[The number of letters received on "Ivy on Trees" is so great that we regret that we are only able to publish a very small selection.—ED.]

LILIUM MARTAGON VAR. DALMATICUM.

SIR,—Mr. Arnott will be interested to know that, long before his death, Mr. Elwes had been convinced that the lily called dalmaticum could not be kept distinct from L. Martagon. In 1908 I raised hundreds of plants from seed of a particularly fine form of L. dalmaticum at Colesborne, and not more than a handful were like the parent.

Every sowing of seed of L. Martagon is pretty sure to produce some plants of L. dalmaticum, and as, in my experience, the latter does not breed true from seed, it can hardly be entitled to specific rank.—A. GROVE.

NAMES OF EARLY POTATOES.

SIR,—If you can kindly grant me the space, I should very much like to express to Mr. Geo. Stuart, Edinburgh, my great appreciation of, and belated thanks for, the valuable information in THE GARDEN of June 5th, page 324. It is most interesting to know all the points of similarity which distinguish potatoes of a type, such as their flower, foliage, habit of growth, colour of stem, colour of tubers, identity of ripening, etc. I was also pleased to note that he agreed with me, that Victory would in all probability give a heavier yield of tubers than Duke of York. Their other points of similarity I am not in the least concerned about. That Victory is a heavier cropper is the point

Digitized by Google

I wish to establish, and so of far more vital importance and utility than the resemblance of flowers and stems, etc.

Knowing as we do the family ties of Victory and Duke, it should go without saying that they must have many points in common. Mr. Stuart, despite his admission that Victory would be superior to Duke as a cropper until it became contaminated (whenever that might happen), says that Duke of York should get pride of place. I should like to ask why? Is it a matter of sentiment owing to the antiquity of the Duke? To keep on growing a potato that has deteriorated must be a waste of soil when an improved variety can take its place.

The main facts of the case are that all the Duke family and many other fine early potatoes failed to pass the tests for wart disease at Ormskirk in 1919. Mr. Stuart also admits that the Duke and Victory type are particularly suitable for cultivation in the northern part of Scotland. This being the case, why did the Board of Agriculture include Aberdeenshire, Kincardineshire and other northern counties in their restriction order for growing the potatoes in question owing to the prevalence of wart disease on areas under a quarter of an acre? This order imposed a great hardship on the "plotter" and those with a small garden, as, so far, they have not been able to give us a substitute to replace Duke or Victory for earliness. My reason for thinking the above-mentioned counties should not have been included in the order for wart disease is the fact that, except in one or two cases, wart disease is quite unknown in these parts.—W. GRANT, *Grathes*.

NURSERIES OF THE BRITISH ISLES.—I

THE OLD GARDENS AT TUNBRIDGE WELLS.

THE firm of Messrs. R. Wallace and Co., Limited, needs no introduction to readers of THE GARDEN, by reason of their long established fame as iris and lily growers.

The present business at Tunbridge Wells, carried on under the auspices of Mr. R. W. Wallace, has its roots as far back as the 'seventies, when his father, the late Dr. Alexander Wallace, of Colchester, began to take an interest in various aspects of horticulture, generally connected with Japanese plants, and more especially with the rearing of lilies. In these early days many new and rare bulbous plants were handled from various parts of the world and a business was started under the title of "The New Plant and Bulb Company." The collecting and growing of orchids was included, also the importing of large tree ferns from New Zealand, and considerable attention was given to the growing of novelties and varieties of the period. It was in this way that the present owner, Mr. R. W. Wallace, was brought into touch in his early days with many interesting plants. In the 'eighties lilies were imported more and more from all parts of the world and their more intensive culture embarked upon, so that amateurs can well understand that Mr. Wallace can lay claim to considerable experience with the many and varied representatives of this fine garden genus. As with the lily, so with the iris, Mr. Wallace has become a grower of repute and the nurseries house what is probably one of the finest collections of June-flowering irises in the country.

THE RHODODENDRON GLADE AT MESSRS. WALLACE'S NURSERIES.

The late Dr. Wallace retired from business towards the end of the 'eighties and for a few years the business was allowed to lapse until Mr. R. W. Wallace returned, in 1894, to resume an active interest after a period of commercial training. Gradually the business grew, the next step being the acquirement of fresh land at Colchester to cope with the increasing demand for alpine and herbaceous plants and the extending popularity of rock and water gardens, laid out according to design. Visitors to the nursery at Colchester will probably remember that a portion of the nursery was laid out as an attractive water garden.

So matters progressed, until the war intervened, when, in common with other nurseries, business slackened off. It was during the latter part of the war, when Mr. Wallace chanced to visit Tunbridge Wells for the first time, that the decisive step to move from Colchester to their present home was taken. His interest was so aroused in certain plants that were being sold at Messrs. Russell's nurseries, formerly Thomas Cripps and Son, and in the general surroundings, that the new site was acquired and the business moved bodily (no easy task) some years ago. Here, amid the most pleasant surroundings, with the inheritance of many fine specimen rhododendrons, seen in the accompanying illustration, and other fine trees and shrubs as a background, the owner decided to add still a further string to his bow and took up the raising and cultivation of flowering shrubs and trees

A PORTION OF THE IRIS GROUND WITH LORD OF JUNE IN THE FOREGROUND.

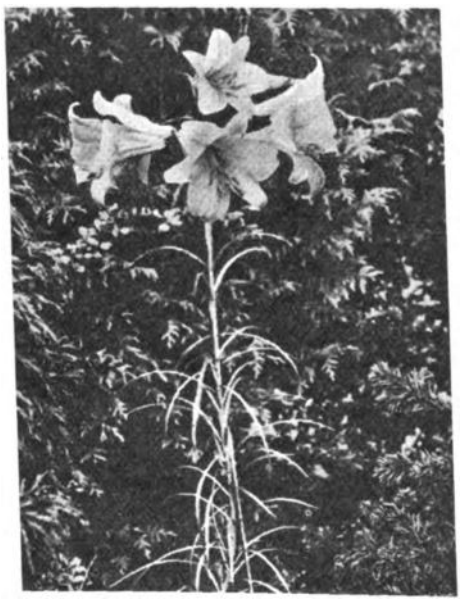
Digitized by Google

in general and more particularly rhododendrons and azaleas, until now he has become known as a specialist.

In recent years, still another aspect of gardening has come to occupy a large place in the activities of the firm and of Mr. Wallace himself. This is the landscape garden department, of which he is in charge. He is especially interested in the development of the natural garden, either in the woodland or with rock and water. Their exhibits at Chelsea and at other horticultural exhibitions stand as testimony to the high standard of excellence which they have attained in this branch.

June is probably the best month to visit the Old Gardens, when the irises and rhododendrons are at their zenith. These, together with the herbaceous flowers, provide a perfect display of colour which well indicate to the amateur grower what he might have in his own garden by the inclusion of a few well chosen flowers and shrubs. The Gardens, extending over some sixteen acres, have a perfect situation on slightly sloping ground, facing north-east and overlook the quaint village of Tunbridge Wells nestling in the hollow. A representative collection of herbaceous flowers is to be seen and this is greatly enhanced by the collections of irises and lilies. The tree and shrub collection is a large one and is entirely apart from the rhododendrons, which extend on either side of the main drive through the nursery. There are to be found some excellent old hybrids, some 15ft. to 20ft. high, full of vigour and bloom, sheltering at their base an extensive collection of species, all of which seem to take kindly to conditions at Tunbridge and are showing remarkable growth this season.

Among the trees and shrubs the specialist gardener will find much to interest him and doubtless will be attracted by the very fine Japanese maples which are on show. The owner has every reason to be proud of the plants, as they are excellent in every way—well habited and of good colour. Abutilon vitifolium was a perfect picture on our visit, with its avalanches of pure white flowers, and it looked even better growing as a bush than, as is usual, on a wall. A number of fine conifers are also included and provide pleasant patches of glaucous



LILIUM REGALE IN THE OPEN

silvery green foliage, which is most pleasant against the bronzy shades of the Japanese maples. Pittosporums thrive exceedingly well and the variegated foliage of P. Silver Queen, related to P. Mayii, with its black wiry stems, looks charming against a dark green background. There are many fine enkianthus, with the rarity cernuus rubens leading the field, and so on one could go with examples.

The irises are at their best towards the end of May and June, and we suggest that all amateurs who can find the time should pay a visit to see them in bloom. They stand waving gently in the breeze on the brow of the hill overlooking the rhododendrons, and it may strike one as anomalous to see these two plants doing so well in the same soil—one a lime lover, and the other a lime hater. There are many fine species and varieties to be seen. All the leading sorts are on view, growing side by side, and the amateur will find these beds not only interesting, but also instructive, since they form an ideal way of comparing one variety with another. The characteristic points of each individual sort can be examined and weighed in the balance against others of similar habit and almost identical colouring. The seedling beds were full of interesting novelties and many of these, no doubt, will find their way to the exhibition stand in the near future.

Lilies can be seen in various points in the nursery, all doing extraordinarily well. One plant of Henryi we noticed had reached some 6ft. and had not stopped adding to its stature, while L. regale was a statue of elegance and refinement against a dark background. The keen amateur will see on his visit the cultural points which make for success in the growing of certain species, such as the necessity for a groundwork of shrubs—for example, azaleas—to protect the bulbs and the tiny stems from frost when young. It is such hints as these which the visitor can pick up from a walk round a nursery, as well as acquiring a more intimate knowledge of the actual plants.

THE FLOWER GARDEN AND GREENHOUSE

PELARGONIUMS.

Some Useful Hints.

PELARGONIUMS may be put in in various ways. They may be dibbled into a border fully exposed to the sun, and before the approach of frost taken up and potted or boxed. Or they may be rooted into pots or boxes at once. The boxes may be any size most convenient, but should be about 4ins. deep.

A few pot sherds, or pebbles, and a layer of well made manure, or rotted leaves, should be put in the bottom of each box. If suitable manure is not available, some good turfy loam may be used instead. Fill the boxes with a good potting soil, or a fine mixture of garden soil and fine river sand. The soil should be made firm, and after the cuttings are inserted it should be well watered. Then stand the box on a bed of ashes in a sunny place.

In exposed situations it may be as well to put the boxes in a frame or turf pit. Protection from heavy rain should be given, but otherwise the plants would be all the better to get as much air as possible.

When taking cuttings, it is as well to avoid disfiguring the bedding plants. Those overgrowing the edges of bed or border may be dealt with for the first batch of cuttings.

Tricolour geraniums and similar varieties may have first attention. Zonal and other strong growing subjects may be treated later on. By taking the cuttings early they can be got in a forward condition, and well rooted before the cold weather of the autumn sets in. In northern and cold districts cuttings thus taken have a better chance of being wintered with safety than when left late into the season.—JOHN WIGHT, *Balthangie, Turriff, Aberdeen.*

POTTING EARLY-FLOWERING BULBS.

THE first or early batches of flowers from bulbs can be obtained without the aid of glass in the form of greenhouse or conservatory, or even a garden frame. The amateur cultivator may raise good plants and flower them in his glass entrance porch or dwelling-room window. The early flowers are always much appreciated and, of course, they are finest when "finished" in a greenhouse.

Roman and French hyacinths, paper white narcissus and Duc Van Thol tulips are the first to be dealt with. The spikes and individual bells of the French hyacinths are larger than those of the Roman, but the latter is very chaste, highly scented and easy to grow if suitable compost can be procured. But for all of these bulbs it is well to provide a good quantity of sweet leaf-soil about three parts rotted. I have grown large numbers of bulbs in almost pure leaf-soil without the addition of any loam. But it will be more satisfactory for the amateur cultivator to use the following compost: Loam and leaf-soil in equal proportions, with sand added at the rate of a 6in. potful to every peck. More sand should be used under and on each bulb.

The bulbs may be grown in flower pots, pans or boxes. When it is intended to disturb the growing bulbs and transfer them to ornamental vases or to tubs in which there are ferns growing, the potting compost should be passed through a three-quarter inch mesh sieve to facilitate the removal of the bulbs in due course. The pots or pans must be very clean and dry inside when they are crocked and filled with the compost. The latter should be moderately dry, too, and the bulbs pressed firmly into it, leaving the tops just above the surface. If many flowers of narcissi are required in one pot, some bulbs may be placed near the bottom and some in the soil at the top in the usual way. All will grow and flower at the same time. Directly the bulbs are potted settle them in the soil by applying water through a rosed watering-can, then place the pots level on a bed of ashes, cover each pot or pan with an empty inverted pot, or box with an empty one and finally bury all under clean sand or old ashes. The young growths will be clean and not

Digitized by Google

malformed. On removal from the ashes place them in a cold frame and very gradually expose the new growths to air and light. Judicious feeding when the flower-spikes first show will be beneficial.—GEO. GARNER.

TOMATOES.

The Importance of Top-dressing.

OPINIONS may differ as to the wisdom of incorporating manure with the soil at the time of shifting tomatoes to their final quarters, but generally it is agreed that when plants begin to set their fruit some help in the direction of food is needful. Experience has proved that pieces of fibrous turf broken up along with rotted manure spread over the surface as the roots begin to come through give the plants an impetus. Those who grow tomatoes for the first time sometimes start feeding before flowers have formed, with the result that a deal of unnecessary wood is made at the expense of fruit. Stimulants can be given as soon as the first truss has set, and these may be continued during the remainder of the season. Sheep droppings, cow manure, if obtainable, ought to be diluted with water. Failing these, Clay's Fertilizer or some other proved concentrated manure will be found to hasten the crop. Tomatoes like a change of food, but under no circumstances ought stimulants to be applied before ordinary water has been given, or in a strong state with the idea of getting fruit to ripen up quickly, as it often ends by plants becoming surfeited and collapsing. Cold water from service pipes should not be used until the chill has been taken off. There is one point which arises out of top-dressing tomatoes to which it is sometimes needful to call special attention; it is the temptation to lop off some of the large leaves, especially in houses where plants are close together. It is a mistake to do so, and nearly always results in bleeding and prevents swelling of fruit. The better way is to tie the leaves back until such time as they begin to yellow, when they can be pinched off.—CLAREMONT.

SWEET LAVENDER.

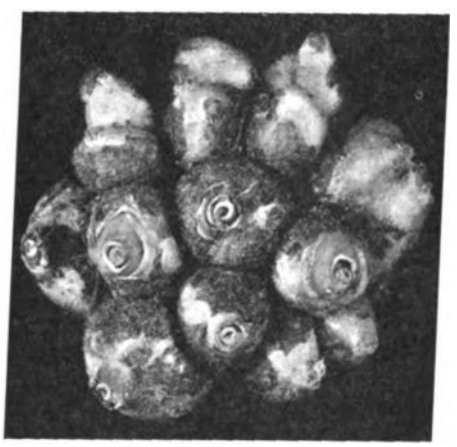
LAVENDER has always been one of the Englishman's favourite "herbs," and there are few gardens which do not boast at least a few plants; in some it is grown in quantity, and during July the lavender hedge or border is one of the delights of the garden.

Lavender is invariably grown from cuttings, and these are best taken in August or September. After the flowers have been removed, the shrubs ought to be clipped into a neat and tidy shape; this, at the same time, ensures a sufficiency of cuttings when they are needed six weeks to two months later. Cuttings consist of shoots broken off with a heel; practically every one will root if firmly planted in sandy soil. If they are from 6ins. to 12ins. when taken, they will soon grow into large bushes. Smaller cuttings taken in the orthodox method by cutting below a leaf joint can be rooted more readily in a frame. Rooted cuttings may be planted out in spring or in autumn, whichever date is more suitable. Growers who wish to plant a lavender hedge often plant the cuttings directly where they are to grow in a V-shaped trench containing some sand. Plant such cuttings 9ins. apart, but thin out to double that distance at the end of the second or third year.

As for all other garden plants, the land in which lavender has to be grown should be well tilled beforehand and enriched by the addition of a moderate dressing of manure. In hot, fiery soils an annual mulch of short manure may be spread round the bushes, or a little may be dug in near them.

The flowers of lavender are collected when they are just open, the stalks tied into little bunches and the bunches set up or tied up to dry, not in full sunshine. Later on the individual blooms are stripped from the stalks and they can be utilised in many ways. Needless to say, the commonest plan is to sew them as they are into little bags which are placed in drawers and cupboards amid clothes and linen, scenting everything with that subtle perfume which we all know.

In certain districts the distillation of lavender is carried out on a grand scale, an almost colourless oil with full perfume being obtained. The oil is used to make lavender water and other mixtures, which cannot very well be made up without apparatus in the home. A useful home preparation is lavender vinegar, which has long figured as a home remedy in fainting and in cases of fatigue. It is best made in the following way: Lavender flowers are loosely filled into a quart bottle and a pint of white vinegar added. This is allowed to stand in a warm corner for a week or two, occasionally being shaken up. It is then emptied into a jug, the bottle cleaned out and again filled with flowers; a piece of cotton-wool is then placed loosely in a funnel and the contents of the jug poured through that into the bottle again; only the vinegar passes through, of course, and the infusing for ten days is repeated. After the second or third time the vinegar becomes heavily charged with the perfume and is ready for use. A little is poured on cotton-wool and daubed on the forehead and the wrists.—CLYDESDALE.



A CLUMP OF LACHENALIA BULBS.
Natural Size.

LACHENALIAS.

IT will soon be time to think about potting up the bulbs of lachenalias if best results are to be secured. One of the reasons for the poorly furnished bloom spikes which all too frequently represent this beautiful South African plant is that the order for the bulbs is left to be included in that for hyacinths and narcissi in the autumn, whereas they stand apart in their requirements in this one respect, and to plant them in September or October gives them no chance of doing their very best. Experience seems to suggest the last week of July as about the ideal time for getting the bulbs into their pots or pans. The extra weeks appear to be beneficial in two respects: they add an appreciable number of bells to the spikes of blooms and they tend to a greater increase in the bulbs themselves. The accompanying illustration is "life size" of a really well grown specimen of one of the Whitewell seedlings, and shows very definitely the result of early planting. It was potted up in July last as a single bulb, and with some thousands of others was grown in a cold house without any artificial heat whatever. For present planting the cluster will, of course, be separated, and will give at least a dozen bulbs which will produce good spikes of bloom, and if planted together in, say, a 9in. pan, or singly, or in twos or threes in pots, they should give a good account of themselves in January or February next, when flowers in the cold house or in the frost-proof frame are especially welcome.—W. DAVENPORT.

FRUIT AND VEGETABLES

SILVER LEAF DISEASE.

NOT only does silver leaf disease attack the plum, but, in orchards, it is now found infesting apples, cherries, apricots, peaches, currants and gooseberries, and occasional reports come in of it being found on trees commonly grown near such gardens. Certain varieties of these fruits are more susceptible to attack than others; and, while none can yet be said to be immune, other varieties show decided resistance to attack. Victoria plum is one of the most susceptible; Czar is a hot second. Newton Wonder in apples seems highly susceptible and, almost equal to it, Early Victoria. Less susceptible are Grenadier, Blenheim Orange, Lord Grosvenor, Bramley's Seedling and Lord Suffield. Among the plums, Early Rivers, Yellow Pershore and the Greengage are highly resistant; while less resistant, but not highly susceptible, are Pond's Seedling, Belle de Louvain and Monarch. Science has advanced very slowly in the investigation of this disease; while it has been firmly established that the fungus, Stereum purpureum, can produce the disease called silver leaf, some doubt still exists as to whether Stereum purpureum is always the cause, and, again, whether infection can only be caused by spores of the fungus which are produced after the disease has killed its host is not yet certain. Growers who have not experienced the disease must learn to identify it; it generally appears on a single branch only, at first, the leaves, practically normal in size, having an unmistakable silver sheen. When the branch is cut it shows abnormal brown markings internally. Later on it spreads and the infested branches gradually die back. It rarely happens that an old tree is totally infested at once; a young tree may be, however. The fungus only produces spores on dead wood; more or less flat plates, at first purple in colour, appear as fungus growths, from ¼in. to 1inches in diameter. As they lose their colour, spores are shed plentifully during the spring, and these spread the disease broadcast. This disease, everyone should note, is notifiable all over the country. There is no known cure for it, but infected branches should always be cut well back and heavy dressings of artificial or liquid manure given to stimulate growth. Plums, however, seldom recover; other trees may. Prunings must on no account be left about, or the fungus will fructify and spread the disease everywhere. Also, when the disease is known to be in the orchard or near it, avoid wounds or paint them with tar.

BLANCHING CELERY.

THE collar method of blanching celery has been popularised by the amateur who cannot and will not spend the time required in making an ideal celery trench. The old plan is still quite common, nevertheless, but we are inclined to think that, apart from cheapness and amount of attention, it has little to recommend it. To be successful

Digitized by Google

with collars they should be in position early and always such that they may be raised or replaced by taller ones at the proper time. Good collars naturally tend to increase the amount of blanch by causing the plants to grow tall. These collars consist of tiles, cardboard, waterproof paper, waxcloth, netting filled with moss and so on. They may be prepared beforehand in some cases or tied round the plants. They should be loose and open at the top at first; later on the top may be plugged with moss. Our own plan is to have prepared collars of waterproof, stiff paper made beforehand; the leaves are then grasped in a bunch, a roll of paper wrapped round them and the collars slipped on over all. The work is quickly done and the collars last many years.—LANARKSHIRE.

WINTER LETTUCE.

IN many districts the culture of winter lettuce in the open is in the nature of a lottery, and cannot be depended upon, but in other, sheltered localities it is a useful crop. In any case, it is worth the attempt out of doors, provided one can give the plants rough protection in severe and snowy weather by covering with a trellis over which straw or pea haulm is distributed. But the value of winter lettuce is such as to warrant additional trouble being taken with it and the setting aside of a frame for reception of plants. For outdoor growing seed ought to be got in in August, but for frames one may, if need be, defer sowing until the following month. Seed should be sown in the open ground in August, and the plants very carefully lifted and deposited in the bed when ready. The soil should be light and rich, that from old potting material and contents of a spent mushroom bed answering very well. Sutton's Winter White and Black-seeded Bath among cos, and All the Year Round and Hammersmith Hardy Green in the cabbage section are varieties that have proved their worth.

Overcrowding in frames should be avoided, and ventilation must be given very freely; indeed, there are few days in the winter when the lights ought not to be raised for the admission of air.—W. F.

POTATO LEAF-ROLL AND MOSAIC.

THOSE who grow potatoes and wish to save seed for next season's planting should have them carefully examined at the present time, and all plants showing signs of leaf-roll and mosaic removed and thus prevent healthy plants from being contaminated.

To the inexperienced cultivator, a few hints as to how those diseases appear on the plants at this season of the year and how they can be controlled may be of help.

Taking leaf-roll first—no variety of potato is immune from this disease. Seed saved from a crop of healthy Great Scot plants grown alongside unhealthy British Queen will show signs of the disease the following season, the disease being carried from plant to plant by green fly and other insect pests. Leaf-roll disease, as the name implies, cause the leaflets to roll upwards and inwards from the edge to the midrib, giving the plants a rolled-up and stunted appearance. The plants turn quickly brown and ripen prematurely.

If seed is saved from plants affected with leaf-roll the crop will be small the following season, causing considerable loss and disappointment to the grower.

Potatoes which are infested with mosaic disease show a mottled appearance—dark green and yellow patches all over the leaves. They are also much crinkled, and smaller than on healthy plants. If we take a leaf from a plant and look at it against a sheet of white paper or hold it up against a bright light, the mottling will be made more visible.

Like leaf-roll, mosaiced plants produce a poor crop, and it would be to the advantage of all growers if a little time was spent at this season of the year in "rogueing" out all those diseased plants and prevent healthy stocks from being contaminated.—GEORGE STUART.

CARNATIONS AT THE CARPENTERS' HALL

ON Wednesday, July 21st, the National Carnation and Picotee Society held, in the Carpenters' Hall, Throgmorton Avenue, the second of their two exhibitions. The fine old hall made a beautiful setting for the many-hued array of border carnations, and it was encouraging to see the interest taken, especially by some of the busy City men, in the cultivation and exhibiting of these hardy flowers. This Society, which is now nearing its Jubilee year and is increasing its membership annually, is to be congratulated on the excellence of the many blooms exhibited by its members.

In Division I the blooms in the trade groups were of a high quality. It could be clearly seen from Messrs. Lowe and Gibson's first prize group that such points as symmetry of outline, strength of stem and calyx, well shaped and horizontally placed guard petals, as well as colour and scent, had been carefully considered when raising and breeding the border carnations exhibited. The varieties Mrs. E. Charrington, Mrs. A. Brotherstone, Centurion and Dr. Stone were wellnigh perfect. Mr. H. Woolman also staged a fine trade exhibit. Particularly good in size and substance were his blooms of Viceroy, Peace Treaty, Mrs. Murray and Flamingo, the new striking apricot variety which is heavily marked and edged with scarlet. Other trade groups were set up by Messrs. Torrance and Hopkins, Messrs. Seymour and Anderson, and Mr. H. Crowhurst, the grower who showed only blooms which had been cut from the open border.

The Cartwright Challenge Cup, which is awarded for the highest aggregate number of points in certain of the open classes, was won by Mr. H. Woolman. His blooms of the glowing pink variety Cockatoo in the selfs, Sam Griffiths in the fancies, Bookham Scarlet among the red varieties, were all in good form. In this section Mrs. O. Hambro, an amateur grower, won two firsts; and Messrs. Lowe and Gibson three firsts. The yellow self, Eldorado, shown by the latter firm, attracted attention. Messrs. Torrance and Hopkins were also successful entrants in several of the open classes; their blooms of Loyalty were carried on strong self-supporting stems.

Miss Shiffner was the most successful exhibitor in the second division, winning again this year the Martin Smith Memorial Cup. Miss Shiffner's sweetly scented blooms of Salmon Clove, as well as Loyalty and Jean Douglas, were excellent in shape, colour and form. Mr. J. Smith had several prize flowers, including the pure white Albion.

The Edward Charrington Challenge Cup for an amateur winning the highest number of points in Division III has not changed hands, for Mr. H. A. Knapton won it again this year. His best blooms were the yellow ground fancies Linkman and Paladin, the white ground fancies Jessie Murray and Mrs. E. Charrington. Mr. R. H. Hickson in Division IV had several prize blooms, all taken from plants which had been grown and flowered in the open border. Several interesting seedling border carnations were on show, one being a white ground fancy, shown by Mrs. C. P. R. Garner.

BOOK REVIEW

CARNATIONS FOR EVERY GARDEN AND GREENHOUSE.

THIS excellent book ("Carnations for Every Garden and Greenhouse," by Montagu C. Allwood. "Country Life," Ltd., London. Price 12s. 6d.), which runs to nineteen chapters, written by one who has been a life-long lover and successful cultivator of this beautiful class of plants, is, as one would expect, full of practical information on all phases of carnation cultivation, not only for the amateur, but the commercial grower. There are chapters devoted to the various classes of carnations, as well as the border pinks, including the newer and now well known Dianthus Allwoodii.

There are excellent chapters on propagation, soils and composts, as well as the various operations of potting, stopping, watering, etc.; in short, the many operations connected with the successful cultivation of the various sections, from the propagation of the young plants to the finished article, is dealt with in detail and in such a manner that the veriest beginner should have no difficulty in grasping all the details of their successful cultivation. It is almost needless to say the commercial side is dealt with in an equally efficient manner.

There are also excellent chapters dealing with the food for and the manuring of carnations. This is deserving of special attention, for the author, rightly, stresses the importance of using the right manures and calls attention to the damage that may be caused by the use of wrong manures. This is a matter that not only the amateur but many professional cultivators might well lay to heart.

Diseases and insect pests and their control have each got a chapter. In dealing with soil sterilisation by steam, the author states that several potatoes should be placed on the top of the soil, and when they are cooked the soil is sufficiently sterilised. This is not very helpful to anyone who knows little about the costly operation of steam sterilisation. We suggest that it would have been more helpful if the temperature and the necessary time for the operation had been given and, of course, the use of a suitable thermometer advised.

The various types of houses for carnation growing, also the value of the carnation for decorative purposes, both from the private and commercial standpoint, is dealt with in detail. The book opens with a chapter on the history of the various classes or sections of the carnation as we know them to-day. In dealing with the perpetual-flowering carnation it is stated that it is the production of several centuries of hybridisation and culture from Dianthus chinensis, the Indian or China pink. So far as we know this is the first time that Dianthus chinensis, an annual species introduced in 1713, has been claimed as the progenitor of the perpetual-flowering carnation, and we feel sure it would have been a matter of general interest to carnation grower and horticulturists in general if the author had stated the source of this information. The origin—so far as it is known—of this class in France is dealt with, also the first attempts in Britain to improve this class, as well as the work in detail of the American raisers that did so much to improve this section and make it the important class it is to-day.

This book has a good index and is profusely illustrated with no fewer than seventy-nine beautifully produced illustrations representing all the phases of carnation culture, thus adding much to the value of the text. J. C.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque ..	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty ..	Pale rose and deep red.
Lohengrin ..	Cattleya mauve.
Mdm. Chereau ..	White, frilled azure blue.
Mrs. H. Darwin ..	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme ..	Pure blue and blue purple.
Prosper Laugier ..	Bronzy cinnamon and velvety crimson.
Rhein Nixe ..	White and violet purple.

One plant each of the 12 varieties, **7/6** post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

McDOUGALL'S Perfect Safety WEEDKILLER

(Non-Arsenical)

TO those who prefer to use a non-arsenical preparation for weeding paths and drives we strongly recommend this weedkiller, which although deadly to all rank growth avoids any risk of poisoning domestic animals, poultry, &c.

Pint tins ..	1/6
Quart ..	2/6
½-gal.	4/-
1 gal. drums ..	6/6
5 gal.	25/-

1 *pint Weedkiller to* 3 *gallons water.*

Perfectly Safe

NEW ROSES AT VINCENT SQUARE

THE National Rose Society was somewhat unfortunate in the date for the show of new seedlings and roses of recent introduction. The third week in July caught many growers with their plants betwixt and between, the first crop of blooms being over and the second crop not yet to hand. Besides this, the Eastern Counties, where many of the exhibition roses are grown, had experienced two storms within a week of the show. Normally, the date—though, perhaps, a trifle late—would have permitted a large show. As things happened the show was somewhat disappointing, except as regards the attendance, which was very large.

Largely in view of the fact that the Society was offering the *Daily Mail* Cup, to be won outright, for the "best new scented seedling rose," the general public was keenly interested in the fragrance of the roses. We mention straight away that the gold cup was not awarded, as the judges could not agree that there was, among the twenty-one, a rose exceptionally fragrant. It would seem that the judges were not of one mind as regards the particular perfume they sought, and if this were so it was inevitable that no award should be made. To us the sweetest scented rose was No. 22, a bright crimson H.T., shown by Messrs. Bees, Limited. The buds are of globular shape and the fully open flowers are flat and shapeless. While we realise that the conditions of the competition require only that the rose should be new and scented, we preferred No. 30, a shapely H.T., shown by Messrs. G. Longley and Son, which was deliciously fragrant and of good conical shape. The colour was much that of the old favourite, Souvenir de la Malmaison Rose, No. 12, a blush pink musk rose, shown by the Rev. J. H. Pemberton, was very fragrant and a good example of its class.

There were many other new seedling roses, but, on the whole, they were rather a poor lot. The following received awards:

LADY WORTHINGTON EVANS.—This should be a very showy garden rose and also useful for exhibition in the classes for decorative roses. It has globular buds and opens to a flat shape. It is velvety scarlet in colour, with a light flushing of maroon at the base of the petals. The young foliage is purplish, and it appears to be a free-flowering variety. Gold medal to Messrs. Alex. Dickson and Sons.

ADELE CROFTON.—This variety was also entered for the *Daily Mail* Cup. It has pointed buds which open to a flattish shape, and the golden yellow colour is slightly flushed with peach. It is pleasantly perfumed. Certificate of merit to Messrs. A. Dickson and Sons.

CHARMING PRINCESS.—This is an uncommon rose. In shape it approximates to what some growers term "cactus," and so has no form. The outer halves of the old gold coloured petals are heavily stippled with scarlet. Certificate of merit to Mr. Thomas Hancock.

CHERRY.—A medium-sized H.T. rose of no particular form, rose cerise in colour, with a pale gold reverse. Certificate of merit to Messrs. S. McGredy and Son.

Although it did not receive an award, J. C. Thornton, shown by Messrs. Bees, Limited, appears to be a desirable garden rose. It is free flowering, of medium size, and of bright crimson colour.

The class for a group of cut roses arranged on a table was well filled and made a good display. The first prize was awarded to Mr. Elisha J. Hicks for a stiff and formal arrangement of very good blooms. His chief varieties were Betty Uprichard, Mme. Butterfly, Mrs. H. Stevens, Ophelia, Hoosier Beauty, Christine and Mabel Morse. Messrs. S. McGredy and Sons were awarded the second prize for a more artistic display, but their blooms were a little weather-stained. Their baskets of Mabel Morse, Betty Uprichard, Mrs. Barraclough and Emma Wright were very delightful. Messrs. Alex. Dickson and Sons were third; and the Rev. J. H. Pemberton was fourth in this large class.

The small groups were arranged on a wall space, and Messrs. R. Harkness and Co. were first with a graceful display of Los Angeles, Mme. Butterfly, K. of K., Betty Uprichard and similar roses. Messrs. D. Prior and Son were second, and they had good stands of Betty Uprichard, Lady Inchiquin, Mrs. Henry Bowles and Etoile de Hollande. Messrs. A. Warner and Son were third.

There was only one exhibit of twelve distinct varieties of exhibition roses on show boards, and the first prize was awarded to Messrs. D. Prior and Son for blooms so much over-dressed that all character was lost. Their chief varieties were Mrs. C. Lamplough, Capt. Kilbee Stuart, J. G. Glassford and Martha Drew.

WITH the greatest regret we announce the death of one of the grand old men of roses, the Rev. J. H. Pemberton of Havering, Essex. As a rose grower he was known the world over.

NEW CARNATIONS

AS DESCRIBED BY RAISERS

MRS. A. A. VLASTO.—Registered by Mr. J. C. Beck, The Nurseries, Henley-on-Thames. Seedling; rosy purple on white ground; size 3ins; fragrance similar to old clove; habit and stem almost as strong as malmaison stems, 24–30in., self-supporting. In habit and constitution unique.

ROSE DU BARRY.—Registered by Mr. J. C. Beck, The Nurseries, Henley-on-Thames. Seedling; Rose du Barry pink, shading to silvery pink; size 3½ins.; fragrance moderately strong; stem strong and good length; excellent constitution.

CANADIAN PINK.—Registered by Messrs. Allwood Brothers, Wivelsfield, Hayward's Heath. Mid-salmon; size 3½ins.; mild fragrance, long stem and free growth.

COTTAGE MAID OF WIVELSFIELD.—Registered by Messrs. Allwood Brothers, Wivelsfield, Hayward's Heath. Seedling × seedling. Ivory white overshadowed with rouge pink; size 3½ins.; strong fragrance; improved white; wonderful habit.

DOWNS BEAUTY.—Registered by Messrs. Allwood Brothers, Wivelsfield, Hayward's Heath. A seedling × Triumph. Bright crimson similar to the old Una Pike; size 3½ins.; fragrance very rich and strong; habit and stem similar to Triumph.

DEREK.—Registered by Lady Mond, D.B.E., Melchet Court, Romsey. Seedling. Red; size 3½–4ins.; fair fragrance; habit and stem very good; seldom splits calyx.

LADY WILLINGDON.—Registered by Lady Mond, D.B.E., Melchet Court, Romsey. Seedling. Violet Mond × seedling. Mauve striped cerise; size 3½–4ins. across; fragrance good; habit and stem very good; very free bloomer; never splits calyx.

MELCHET BEAUTY.—Registered by Lady Mond, D.B.E., Melchet Court, Romsey. Seedling. Mauve striped cerise; size 3½ins.; fragrance very good; habit and stem very good; very free and never splits calyx.

MILADY.—Registered by Mr. Ernest W. Bishop, Elmhurst, St. Leonards Road, Windsor. Seedling. Near Enchantress.

CHARLES PIERLOT.—Registered by Mr. E. Martin Smith, Codicote Lodge, Welwyn. Seedling. Apricot; 5ins.; slight fragrance; habit and stem good; French type.

MARGARET.—Registered by Mr. A. J. Pointing, Appleton Nursery, Bulpham, Essex. Ward × Triumph. Purple crimson; size 4½–5ins.; slight fragrance; habit and stem rather weak for the bloom; calyx splits.

(To be continued.)

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE FRUIT GARDEN.

Where the runners of strawberry plants were layered in 3in. pots as advised in a previous issue, the runners will be filling the receptacles with roots, and in consequence must be kept well supplied with water. In a week or so the runners are severed from the parent plants and new beds are made. Make the soil firm about the roots and keep them moist by watering occasionally if the weather proves dry. A portion of the pot runners are set aside for pot work and forcing, and these are plunged in ashes for a short period until they have quite recovered. The main bed outside should be an open site, but for an early supply of ripe fruits a few lines on a south border is advised. Bear in mind that the average life of a strawberry plant is three years; after that time they cease to be a paying proposition.

Fig trees are growing freely, and the growths will need thinning, leaving just enough to cover thinly the allotted space. Expose fruits to full sunshine.

At this season keep the hoe going between the fruit bushes, and trees on walls must not be allowed to suffer from drought. Light waterings are futile, it is much better to afford a good soaking and then mulch the roots with manure. Wall trees will benefit by a daily spraying from the hose pipe or garden engine when the weather is fine until the fruits begin to ripen. Summer pruning of fruit trees should be completed.

AMONG THE VEGETABLES.

A winter supply of lettuce is needed in many gardens, and if cold frames are available this is possible, providing the weather is not too severe. A good sowing of both cos and cabbage varieties should be made now, and further fortnightly sowings till the middle of September. For winter work All the Year Round, a cabbage variety, and Hicks' Hardy Cos are useful; while for an early spring supply Black-seeded Bath Cos is best. Corn salad is a good substitute for lettuce, and it may be sown now.

Jerusalem artichokes have attained a fair height, and at this season some of the plants are often injured by wind. To prevent this the tops can be cut off about 4ft. from the ground level. Globe artichokes should be top-dressed with old potting soil or manure.

Brussels sprouts planted out early have made considerable headway, and rough winds will play havoc among them unless each plant is given a stout stake and so made secure. Prevent any weeds from ripening seeds, this will tend to keep the garden clean in autumn when hoeing is often useless.

THE FLOWER GARDEN.

The ericas or hardy heaths constitute a charming race of peat-loving plants, and now is a good time to propagate any particular form from cuttings. Half-ripened lateral growths are chosen, and then inserted firmly in sandy peat soil. They will root under a bell-glass or in a cold frame. Care is needed in the preparation of the cuttings. Any of the tiny leaves to be removed must be trimmed off with a sharp knife. Rosemary and the different varieties of lavender are propagated at this season by pulling off small side pieces of the old plants and setting them out in lines on any piece of vacant ground. Wallflowers are well advanced, and ought to be transferred to the reserve garden, planting them 1ft. apart. When established remove the centre of each plant, no more pinching being required. Other seedlings from May sowings, such as sweet williams, Canterbury bells and Cheiranthus Allionii, may be treated likewise. To prolong the flowering of violas remove the seed pods, and continue to propagate choice varieties by means of basal shoots until the requisite quantity is obtained.

Seed Gathering.—A host of plants ripen their seeds in this country, and it behoves the grower to collect a little seed each year whereby a nice batch of plants can be raised. This applies especially to rare and choice specimens and others which germinate freely directly the seeds are ripe, an example being all the hardy primulas. Always save seeds from plants of the best habit and those that show even the slightest improvement on the type. These remarks apply more particularly to herbaceous and rock garden subjects. Seeds of many are not often procurable.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

WORK IN THE GARDEN.

In cold, late localities, the first week in August is none too early to sow a second lot of cabbage, cauliflower and brussels sprouts seeds. For the seed bed make a choice of a sheltered spot on an open sunny border to have hardy plants from free exposure. On germination, prick off a supply into a frame that can have the lights put on in extreme cold weather. If given some form of protection those remaining in the seed bed may survive the winter and will be found useful to plant for succession crops.

Autumn-Sown Onions.—The time for sowing these is important, and local knowledge will be the best guide. It is good to have the plants well forward before winter sets in, but not so far as to be in danger of injury from frost. Sow the Tripoli varieties or White Lisbon in quantities for early spring use, and selected types for transplanting in spring to mature the following summer. In late districts where these fail to ripen properly from spring sowings or where onion mould is troublesome, this method may prove advantageous, choosing a dry site for the seed bed.

Parsley, with the protection of an improvised shelter, will usually survive the winter, yet there has been occasions when a sowing made now in a cold frame served a useful purpose.

Spring Cabbages.—Considering how little is the time involved, and the practical advantages gained from the operation, it is worth while to prick these off into nursery lines previous to permanent planting. A light soil adaptable to a free root-run, not over rich and made firm before planting, will meet the occasion.

Corn Salad is probably less valued than its merits as a quick-growing salad for spring use deserve to be. Make a first sowing this month in drills 6ins. apart, thinning to 6ins. in the rows. Ordinary soil will grow it if the situation is open and dry. The crop is gathered the same as spinach.

Endeavour to complete the summer pruning by pinching side growths of apple and pear trees, especially those forms which require training and regulating to space, *i.e.*, bushes, pyramids and espaliers.

Hedges.—In that period towards the end of the fruit season—after all rough grass has been cut over, arrears made up in edging and cleaning walks and just before the essential autumn trenching—clipping hedges should be carried out. If this is done any earlier there is a secondary growth which necessitates a further application of the shears. Then the summer growths have not become too hard through the process of ripening. It is recommended that we prune yew hedges in late spring and laurels in early summer, but it is usually found that these periods are sufficient unto themselves concerning work to be done. It is possible to treat them *en bloc* and have quite good hedges. Commencing with box, yew, privet and holly, the wounds will be sufficiently healed over before frost occurs. Later buck and thorn are stiff enough for using the hedge knife on parts out of the reach of shears.

Doune, Perthshire. W. MCCARRELL.

CONSERVATORY AND GREENHOUSE.

Dimorphotheca Ecklonis.—This South African composite is deserving of more general cultivation for greenhouse and conservatory decoration. It is easily raised from seed or cuttings, and plants raised by this means during the spring should make fine specimens for next year. It is not, however, too late to make a start at the present time, for plants raised at this time, either from seed or cuttings, will make excellent flowering plants for next summer. This plant grows freely in any good potting compost, and only requires cool greenhouse treatment during all stages of its cultivation. To produce well furnished, bushy plants, it is necessary to pinch the young plants several times.

Vallota purpurea.—Dry bulbs of this beautiful plant are usually offered about this time. It is surprising how seldom one sees this plant in good condition in gardens. On the other hand, how many fine specimens are common in cottage windows.

This plant, when established, seems to resent disturbance, and it is very unwise to disturb healthy specimens, as they are frequently difficult to establish again; this, no doubt, is due to overwatering before they have made a quantity of new roots; this, I may say, is a common cause of failure with many newly potted bulbous plants. Starting at this time with dry bulbs, they may be potted singly in small pots, or several bulbs may be placed in larger sized pots. The pots should be well drained, otherwise this plant succeeds in any good potting compost. After potting, stand the pots in a cool greenhouse or cold frame, and afford water at the root very carefully until they have made some growth and plenty of new roots. This plant is really evergreen, and must not at any time be completely dried off, although during the winter months it should be kept drier at the root.

Fuchsias.—Well grown specimens are always very useful for conservatory decoration, but in many gardens it is not easy to find space for storing them during the winter. In any case, it is not really necessary to keep old specimens, as fine plants at least 8ft. in height can be grown in less than twelve months. For this purpose the required number of stock plants should now be partially cut back, and placed in a house where a temperature of 50° to 60° Fahr. can be maintained. Young growth is soon produced, and should be secured for cuttings during September. When rooted the young plants should be potted off singly in small pots. Subsequent details consist in potting them on as they require it, and keeping them growing steadily on right through the winter.

If tall pyramid specimens are required, the leading shoot should not be stopped at any time, but should be kept trained up to a neat stake, as lateral shoots develop they should be pinched frequently to form a good foundation; this pinching should be continued up to about six weeks before they are required to flower.

Fuchsias, especially the stronger-growing varieties, are excellent for planting out in the conservatory and training up pillars and over rafters; while varieties that are naturally of a drooping habit are fine for filling hanging baskets.

Cyclamen raised from seed sown last August should now be ready for placing in their flowering pots, which should be 5ins. or 6ins. in size, according to the strength of the plants. The compost should consist of 3 parts good loam and 1 part of leaf-soil and sand, or, better still, some old mortar rubble; while a 5in. potful of bone-meal may be added to every bushel of soil. After potting they are best stood in cold frames, as later on the lights can be removed during the night, as the plants greatly benefit from the dews at night.

Kew. J. COUTTS.

CATALOGUES RECEIVED.

Messrs. Barr and Sons, 11, King Street, Covent Garden, London. A list of autumn and winter flowering bulbs for early planting. Early hyacinths, narcissi and freesias for forcing, colchicums, hardy cyclamen and comprehensive lists of nerine hybrids and crocus species are all included.

Messrs. Stewart and Co., 13, South St. Andrew Street, Edinburgh. A catalogue for bulbs and bulbous plants for forcing and bedding. Amaryllis, ranunculus, anemones and crinums are listed, as well as narcissi, tulips, hyacinths, etc.

Messrs. T. Smith, Daisy Hill Nursery, Newry. A complete list of bulbous and tuberous-rooted plants.

FOREIGN.

Messrs. C. G. Van Tubergen, Jun., Zwanenburg Nurseries, Haarlem, Holland. A catalogue for bulbous plants, tuberous-rooted plants, herbaceous perennials and certain uncommon bulbs.

The Yokohama Nursery Company, Limited, Yokohama, Japan. A descriptive and illustrated catalogue of lilies, Japanese trees and shrubs, ferns, bog plants, conifer seeds, orchids, etc.

Messrs. Ant. Roozen and Son, Overveen, Haarlem, Holland. A catalogue of choice Dutch and Cape bulbs.

NEW AND RARE NARCISSI

SPECIAL EARLY OFFER for the sake of Colonial Visitors and those who like to order early

F.C.C., R.H.S., signifies First-Class Certificate, Royal Horticultural Society. A.M.—Award of Merit. The date after raiser's name indicates the year the Daffodil was put into commerce. The Letters and Figures placed before each variety denote its position according to the Classification of the R.H.S.

BARBARIC (Chapman, 1925). A very fine showy flower after the style of Brilliancy, but much larger. Long pointed perianth segments, cup orange. A long stemmed and vigorous plant. Mid season. **£2 2s. per bulb**

1b **BEERSHEBA** (Engleheart). This is a real advance in white trumpets and is built on somewhat new lines. Trumpet long and slightly funnel-shaped; segments long and slightly pointed. Stalk longer than most of the pure white Daffodils. A very distinct and beautiful show flower; growth vigorous and free. F.C.C. R.H.S., 1926. **£8 per bulb**

1c **CARMEL** (Brodie of Brodie). Perianth absolutely smooth and flat, the pure white segments overlapping with perfect evenness. The trumpet is of beautiful form, with a neatly recurved brim; colour clear yellow. A superb flower of perfect balance and show form. Good healthy grower. A.M., R.H.S., April, 1926. **£4 per bulb**

9 **FIONA MACLEOD** (Pearson, 1926). We think this is the largest and best formed Poet we have yet seen. The segments are very rounded, and of very firm texture. The whole flower measures 3½ in. across. Stalk 18 to 20 in. long. Late. **25/- per bulb**

1a **GENERAL TOWNSHEND** (Pearson, 1924). This may best be described as a much improved Lord Roberts. A large firm flower of show quality, borne on long stalk. Plant vigorous and free, with broad foliage. Mid season. **10/6 per bulb**

4a **GERTIE MILLAR.** A giant among the Giant Leedsii. When fully expanded the whole flower is ivory white. It is a real giant, the whole flower being 6 inches across, while the frilled cup is 3 inches across. A sensational flower. **£3 per bulb**

4a **HYMETTUS** (Brodie of Brodie). A most distinct and charming flower, spreading pure white perianth of large diameter; the cup is not so long as in most Giant Leedsii, and is most attractively reflexed and frilled at the brim. When fully developed it is ivory white, margined with clear lemon. **15/- per bulb**

1c **LADY MINE** (Pearson, 1923). A very bright clear bicolor trumpet Daffodil. The flower is of good form, substance and pose, and is carried on long stalk. The habit of plant is quite remarkably vigorous and free. **15/- doz. 1/6 each**

2a **LUCINIUS.** A very fine Giant Incomp. of Dutch origin. Whole flower bright clear yellow. The perianth is of faultless form; the cup is large and rather spreading. Long stalk and good healthy habit of growth. Rather late. **12/6 per bulb**

4a **MITYLENE** (Engleheart, 1925). A new break in this section. A grand flower having very broad and rounded, very much overlapping segments of pure white large wide and smooth saucer-shaped cup, of pale primrose, fading to cream. superb show flower. A.M., Mid. Daff. Society, April 23/25. **25/- per bulb**

1c **MOIRA O'NEILL** (Engleheart). The most refined and beautiful bicolor trumpet yet offered. The large flower is perfect in shape and pose, and the plant is extremely vigorous, having leaves broader than Emperor. **30/- per bulb**

4a **MRS. R. O. BACKHOUSE** (Late Mrs. R. O. Backhouse). A quite unique flower. A Giant Leedsii of trumpet proportions. The perianth is white; the trumpet is creamy white, edged and shaded with a most distinct tinge of pink. Originally sold at £50 per bulb. **Now offered at £15**

3b **PRINCESS MIRIAM** (De Graaf, 1924). A large and beautiful flower; perianth white, flat and perfectly formed. The cup is yellow edged orange. Very long stalk, plant vigorous and free. Very late. A really good novelty at a moderate price. **25/- per bulb**

1c **ROSARY** (Engleheart). This variety has undoubtedly Leedsii blood in it, but by measurement it goes into the bicolor trumpet section. The flower is of largest size, and of fine substance, having large white perianth, and splendid big wide expanded trumpet, rich warm cream colour, distinctly suffused with a flush of shell pink. The colour only develops on the plant; if cut in bud it does not develop. Strong plant with broad foliage, rather late. **37/6 each**

9 **STRIKING.** A very fine Poet. Flower firm and well rounded, with brilliant all-red eye. **30/- per bulb**

TENEDOS (Engleheart). Without doubt the finest Giant Leedsii yet produced. Flowers of largest size, borne on very long stalks, plant very vigorous and a quick increaser. Segments pure white, of great substance, slightly pointed. The large cup is pale lemon on opening, passing to white when fully developed. A.M. Mid. Daff. Soc., 1923. F.C.C., Mid. Daff. Soc., 1924. **£4 10s. per bulb**

1c **VESTAN** (Copeland, 1923). A huge bicolor trumpet Daffodil, but not at all coarse. Very vigorous and free. Attracted attention on our stand at Birmingham, April 19th, 1923. **5/6 per bulb**

2a **WHEEL OF FORTUNE** (Copeland, 1923). A very fine Giant Incomp. Whole flower soft luminous yellow; cup large, segments broad, well-rounded and overlapping. Plant strong and vigorous. Voted to be the best flower in the show at Mid. Daff. Exhibition, 1925. **£2 per bulb**

2b **ZILLA** (Mrs. R.O. Backhouse, 1923). A very fine new variety, flower large, segments broad and imbricated, creamy white. Cup large and rather spreading, yellow deeply edged bright orange-scarlet. A good strong grower. Much admired on our Show Stands at R.H.S. and Birmingham, 1923. **30/- per bulb**

Editorial Offices: 20, TAVISTOCK STREET, COVENT GARDEN, W.C.2. *Offices for Advertisements:* 6-11, SOUTHAMPTON STREET, STRAND, W.C.2.
Entered as Second-class Matter at the New York, N.Y., Post Office.

GARDENING WITHOUT A GARDEN

LIVING in London I find that I can no longer do without a garden in the city. Unfortunately, I have not even a cat run in which to grow plants; on the other hand, I have a flat roof, ample in size for a frame—or two frames, in fact. After pondering over what is going to inhabit those frames, I have decided on cacti and an odd succulent or two and alpines in pots. The former are no trouble at all. For a year past I have had a dozen or so in pots on a windowsill, where they have been watered now and again when I happen to remember their existence. They have never been touched or repotted or fed. One or two have condescended to flower, including a haworthia, while several are rapidly overgrowing their pots. They are *the* plants for London, since it is impossible to kill them. If I go away and leave them for a fortnight, they are there safe and sound when I return. Dirty and sooty they may get, but dirt does not seem to harm them. This collection will, therefore, be increased. But their cultivation is so simple that I am going to fly after larger game, alpines in pots. To those who garden in the country this may seem an easy task; but here are some of the difficulties: absence over week-ends when they are left alone; too much sun and too much shade, for it is impossible to dash out on the roof at odd moments of sunshine to shade or uncover them; the difficulties of ventilation, particularly in the autumn when fog is about and the air is as acid as can be; dirt accumulating on the foliage and acid deposit on the soil, for it is almost impossible to keep them off unless the frame is airtight, which, of course, is an impossibility. Still, with all these difficulties, I am going to make an attempt, and it may not fail. Where I am in doubt is what plants to start with, as space is limited. There are certain obvious starters that cry out to be attempted, such as Irises persica, reticulata and histrioides, Saxifrages Burseriana and Irvingi, Campanulas carpatica and Portenschlagiana, some of the crocuses and, perhaps, a lewisia or two. But after that I am stuck. Could any reader who has grown alpines in pots successfully under town conditions make any suggestions? I have to bear in mind the absence of two or three days at a time when they will more or less have to take their chance. I have one or two ideas for combating the other difficulties, but I am saying nothing about them until they are tried out. Am I too optimistic if I think that with a certain amount of grooming and attention alpines should prove satisfactory subjects for a frame on a London roof? Perhaps others may succeed admirably, though I have not heard of the attempt being made to grow them successfully year in and year out.

E. H. M. C.

THE FRAGRANT ROSE ZEPHIRINE DROUHIN.

FOR this week's plant we suggest the old rose Zéphirine Drouhin, which has much in its favour and few faults. It has every merit as a good useful garden rose. It has a long flowering period, and, indeed, improves as the season advances, while the deep rose-coloured blooms do not turn purple. Best of all, it has the sweetest of perfumes. Although this old French rose is admirable for pillar purposes, it is seen to best advantage as a free-growing hedge, for it requires little or no pruning and year after year its graceful arching sprays will be covered with bloom. One other advantage: it has few prickles, and so is a good rose for cutting; in fact, it is an excellent all-rounder.

SOME OLD-FASHIONED PLANTS—III

TO deal with the many old florists' flowers of outstanding merit now rare is beyond the scope of these short articles. But there is a wide and intensely interesting sphere of work in connection with the reviving of these as well as other erstwhile favourites, and a profitable one withal, for I believe people of to-day are keener in regard to these half-forgotten relics than ever they were, and this in spite of the fascination of the novelty. And, after all, if we collect old china, rare prints and books and the like, why not plants? For my part I would rather have a good plant of Dianthus Cæsar's Mantle, one or two of the very precious and lovely forms of Primula pubescens alba (nivalis) or P. marginata Linda Pope, than, let us say, a musty volume of "Tristram Shandy."

But I must pass on and put in a plea for a fuller recognition of the old English columbine, Aquilegia vulgaris. For the large-flowered deep blue and pure white forms of this stately plant I have a regard so profound that I can scarcely contemplate without prejudice the ranks of long-spurred usurpers which have done so much to extirpate their distinguished predecessors. Such wallflowers as Harpur Crewe, with its little bunchy orange flowers on long tapering spikes, is still worth a front seat anywhere, and there is, or was, a good double red and one of a very rich, soft yellow, called, I think, Golden Drop, both of which have a claim upon us. Another worthy crucifer at one time more common is the Bladder Pod, Vesicaria utriculata, which makes so lavish a display of yellow throughout the spring. Then there is our old friend Honesty, Lunaria biennis, which, if it does not arouse much excitement, has given us a pure white form of very ancient origin which is a first-rate subject for such shady, drippy places as are disdained by most plants. Yet another excellent biennial is the tall, large-flowered evening primrose. There may be any quantity of Œnothera biennis about, but how often does one see a well grown group of var. grandiflora (Lamarckiana) placed against some shadowy background? Baptisia australis, with a rare loveliness in its sky blue flowers, is now seldom met with. I always associate it with the Cretan mullein (Celsia cretica) and the Blue Cupidone (Catananche cœrulea), for all three strove together, with Sweet Cecily, a fragrant cedronella (probably C. cana) and other aromatic old herbs in a garden I knew long ago.

No garden which opens its hospitable gates to old-fashioned flowers can fail to be other than generous to the hardy geraniums

THE FIERY CRANESBILL, GERANIUM SANGUINEUM.

which, to do them justice, would need a page or two of print. Our own G. pratense in its many forms; the fiery G. sanguineum G. ibericum and G. gymnocaulon, their large flowers a rich violet-purple; the splendid G. armenum, whose vivid crimson is veined with jet; the sweet-scented G. macrorrhizum of our old gardens of fragrant herbs; the excellent G. grandiflorum, with its big twin bells of clear blue, are but a few of the priceless old cranesbills which have been handed down to us and which are now not nearly appreciated at their full worth. Why this is so it is difficult to guess, for these and other geraniums are among the handsomest of border and woodland perennials. They are unquestionably hardy, easy under almost any conditions, ask but little attention, and rarely fail to bloom abundantly.

The symphytums, or comfreys, may be among the Ishmaels of herbaceous perennials, and some, perhaps, deserve no better fate; but there are others which are too good to be overlooked. S. caucasicum, still to be found in cottage gardens, with its twin racemes of clear Cambridge blue pendants, is an excellent subject for the woodland or growing between shrubs. For me it has merit enough for a mixed border containing many plants, not half as attractive and easy, listed at four times its price; and it has got for companions the ruby crimson S. bohemicum and a choice form of S. officinalis of moderate size and with pure white flowers. These bloom continuously from the end of April until the later summer, and in the same border is a very old friend that does not often greet us these days, Ranunculus aconitifolius fl. pl, Fair Maids of France or Bachelor's Buttons. The smug little white blooms of this hearty old perennial always create interest, and the single-flowered type is more beautiful, if less quaint. Even so, there is many a garden of to-day in which R. aconitifolius is rarer than it was in the days of Tudor England, and I readily forgive Farrer for pouring his opprobrium upon the double-flowered form, since he makes amends for this by waxing enthusiastic over the single.

A few years ago the polemoniums looked like vanishing from our borders, but a few have come back again and some of the more recent developments indicate what excellent material we have in these modest, homely old herbs, and they should encourage us to hunt up and restore some of the many delightful species and varieties which were by no means such strangers in the gardens of a generation or two ago as they are to-day. And so I might proceed to the anthericums and trilliums, to liatris and cimicifuga, the hellebores and spurges and others,

OLD ENGLISH COLUMBINES AT THE EDGE OF A WOOD.

many of which are languishing in the "desert air" of remote gardens awaiting the hour when the fickle pendulum of public fancy may swing their way and bring them once more the recognition they so richly deserve. We now have nurseries of native plants, our specialists in novelties are like green fly for multitude. Why not a line in genuine antiques? A. T. J.

CYCLAMEN FOR THE GREENHOUSE

CYCLAMEN in many beautiful varieties are more or less indispensable for decorative work, not only for furnishing the conservatory and greenhouse but also for decorative purposes in the dwelling-house, for which purpose they are admirably suited either as pot plants or in the cut state for table decoration. As pot plants they are ideal for room decoration, as they will produce their flowers for many weeks—indeed, for several months in a cool room where they can have plenty of light and air.

There is a vast difference between the wild type of C. persicum, with its small beautifully poised flowers, and the giants of the present day with their wide range of beautiful colours; but beautiful as the present-day race is, there is a great danger that with increased size of flower much of the charm and elegance of the wild type will be lost. Like the Chinese primula, the greenhouse cyclamen has never been crossed with any other species, and the many beautiful and strange forms which we possess and enjoy to-day are due entirely to many years of careful selection, and if seed is procured from a reliable source each variety may be expected to come true; although variations may be expected and welcomed, as they may lead to improved varieties.

The colours range from pure white, as seen in Giant White and White Butterfly, through varying shades of pink to cherry red and crimson, also rose and salmon. Among named varieties Firefly, Vulcan, Pink Pearl and Fringed Pink Pearl may be mentioned, also the crested variety Eileen Low. There are now varieties with salmon and salmon-scarlet flowers, like Bath Beauty and Salmon King, while the silver-leaved salmon is worth growing for its foliage alone. In this respect a large batch of cyclamen provides a wide range of beautiful leaf markings, which adds considerably to their decorative value. In addition to the crested varieties, which have a raised crest on the centre of each petal, there are now a great variety with frilled or fringed petals. These are generally known as Papilio varieties. Although they find many admirers, they lack the form and charm of the smooth-petalled varieties. They are all, of course, extremely interesting as showing the wide range of colour and form that has been evolved.

Although the cultural requirements of the cyclamen are, or appear to be, fairly simple, it is not everyone who can grow them successfully. The reason for this appears obscure. Possibly local conditions may have something to do with success or failure. About the middle of August is the best time to sow the seed, but one must be guided by local conditions. Here at Kew, where winter light is at a minimum, the young plants make so little progress during the winter that it is an advantage to sow during July. On the other hand, I have sown seed at the beginning of January and had excellent flowering plants the following November, but for general purposes the middle of August may be regarded as the best time for seed sowing.

It is very important that the seed be fresh, for at the best cyclamen seed is irregular in germinating. Thus, old seed may take so long to germinate that one's plans may be seriously upset. The seed is best sown in pans in a compost consisting of one-half good mellow loam and one-half well decayed leaf-soil and sand. The seeds may be dibbled in singly or arranged evenly on the surface of the compost, afterwards covering them to about their own depth with a portion of the compost, to which a little more sand may be added. The seed may be germinated in a cool greenhouse, but it is an advantage if pans can be placed in a little bottom heat. As they germinate and are fit to handle the seedlings should be carefully lifted and pricked off into well drained pans in similar compost to that in which they were sown, taking care not to bury them too deeply. When large enough they should be placed in thumb pots, in which they should be wintered, or they may be wintered in the pans, potting them off singly early in the New Year. During the winter they should have a position on a shelf well up to the roof glass

THE BEAUTY OF THE GREENHOUSE CYCLAMEN IS ADMIRABLY SHOWN BY THIS GROUP OF WELL GROWN PLANTS.

Digitized by Google

in a house where a moist atmosphere and a temperature of about 60° can be maintained. Early in the New Year they should be ready for a shift into larger pots, using at this stage a compost with a little more loam. For the final potting little or no leaf-soil should be used, unless the loam is very heavy, and some old mortar rubble may with advantage take the place of sand, as I consider lime is of prime importance in the successful cultivation of cyclamen. A dusting of soot and 5in. potful of bone-meal should be added to every bushel of compost. As the season advances the plants should gradually be accustomed to perfectly cool conditions. From the beginning of July until August the plants, according to their condition, should be ready for their final potting, pots 5ins. in size being suitable. A cool, moist atmosphere must be maintained. A cold frame is ideal for them, especially when only small quantities are grown. They should be shaded during the hottest part of the day, while during the night, when conditions are favourable, the lights may be removed altogether, as they benefit from the dews at night. About the middle of September they should be brought into a light, airy pit or greenhouse. When they have well filled their pots with roots they should be fed with diluted farmyard manure, guano or some other approved fertiliser.

Thrips are sometimes present, usually being caused by wrong cultural conditions, such as a dry atmosphere. If they prove troublesome a nicotine fumigant must be used. Cyclamen are also subject to attacks of begonia mite. This, however, can be prevented by the use of the sulphur vaporiser. Vine weevils, too, sometimes prove troublesome, their larvæ finding a home under the corms, where they eat the roots, the first sign of their presence being the collapse of the plant. To combat this pest some means must be taken to trap and destroy the weevils.

Cyclamen flowers should never be cut, but should be pulled out, as the cut ends are apt to cause decay in the young flower-buds. The hard ends of the flower-stalks should be cut off and the flowers without delay be stood in water, as they are—especially the giant types—somewhat difficult to revive if allowed to flag. If they have to be sent away, they should be stood in water for an hour or so before they are packed up. Wrapped in tissue paper and packed tightly, they should travel perfectly. Space forbids me saying anything about growing-on old plants, but this is not much practised at present, as most cultivators find that young plants serve their purpose best. J. C.

NOTES OF THE WEEK

STARWORTS.

Points About Disbudding.

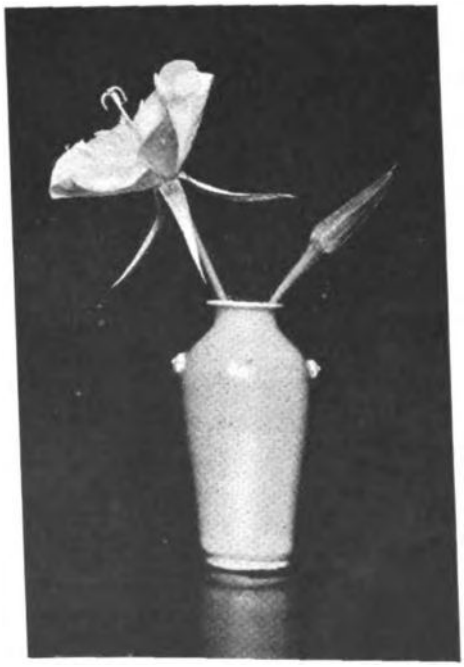
WHEN in a garden last autumn, I noticed among a group of starworts sprays of blossoms that were larger than others. They had been disbudded, and the many flowers had been sacrificed for the few. I did not make any comment, but the thought struck me that in these magnificent garden flowers that bring such a wealth of colour in the waning of the year, there was not the slightest need to interfere with them, or retard their output in any way. Size of flower in starworts is no criterion of enhanced beauty. We do not add one iota to the attractiveness by producing individual blossoms as large as a florin; on the contrary, we miss much loveliness in the garden and in the home, where they are carried for table decoration. It seems to me that the less we attempt to follow the abnormal the better. Who desires to emulate the grower of chrysanthemums in this respect? We have single chrysanthemums which, taken on the crown bud, or disbudded on the terminals, will give us size, if such is desired; but for Michaelmas daisies let us have all the joy and pleasure they are capable of bringing as they open in huge sheaves of blossoms!—W. F.

ŒNOTHERA CÆSPITOSA.

THIS dwarf white evening primrose is a fairly well known plant, yet it is not seen very often in gardens, perhaps because its habits are rather inconvenient; for it is a great wanderer, often dying out where it was originally planted and reappearing in half a dozen places several yards away. But as the finest of our hardy, night-flowering plants it is well worth a little patience.

The rough green buds prepare to open an hour or two before sunset, when the pleated white petals begin to bulge out between the sepals, and if they are picked and brought into the house at this stage their flowering may be watched during dinner. The sepals, under the pressure of the swelling petals, suddenly spring apart and, bending downwards, about as fast as the minute hands of a clock, allow the petals to unfold into a great white chalice, some 4½ins. across, tinted pale green at the throat and enclosing a green style and five delicately designed stamens looped about with ropes of sticky yellow pollen. All through the night the flower pours out a strong, sweet scent, rather like that of Magnolia grandiflora, but a trifle heavier, till about eight o'clock next morning, when the petals begin to flush with rose, which deepens to bright pink as they fade limply an hour or two later.

The plant flowers freely and, after a hot day, two or three of the large white blossoms may



A BLOOM OF ŒNOTHERA CÆSPITOSA.

usually be seen floating in the twilight over each clump of rough leaves. They are carried on a corolla tube about 5ins. long and the moth that can reach their nectar must have a very lengthy proboscis.

Œnothera cæspitosa is sometimes known as Œ. eximia or as Œ. marginata, and under the last name was figured in the Botanical Magazine in 1870 (No. 5828), a few years after its introduction to general cultivation from the Californian Rockies, where it had been discovered in 1842 by Mr. Nuttall.

It prefers a loose, stony soil in full sun and, as might be expected from its place of origin, it is not very patient of cold, wet winters, so that it is well, except when it has a perfectly congenial situation, to pot up a few of its runners in the late summer and keep them in a frame till the following spring.—F. A. HAMPTON, *Chesham Bois.*

AUTUMN CROCUSES.

THERE are many pitfalls to be found among the popular names of plants, and a very good illustration of this is to be found in the so-called autumn crocus. By this term the average person means a plant which is not a crocus at all, in spite of the superficial resemblance. The autumn crocus should more properly be known as the meadow saffron; that is if one wishes to avoid the use of its scientific name, Colchicum autumnale. Mostly one finds the meadow saffron in old-fashioned gardens, where its rosy purple flowers, produced before the leaves appear, are to be seen in September and October. The colchicum is one of the most accommodating plants for one can buy the bulbs in the late summer and plant them in any well drained sunny position, feeling sure that, in a few weeks, the blossoms will be out. There are many interesting varieties of C. autumnale, showing a wide range of colour from deep purple to pure white. There are, as well, some handsome double forms, all of which are very showy. Other species of colchicum include C. Parkinsoni and C. speciosum, the latter having flowers nearly 12ins. in height. This plant, which hails from the Caucasus, produces broad and handsome foliage in the spring. The individual flowers of the colchicums do not last long, but each bulb is capable of bearing a large number, so that the display of bloom is protracted. For those in search of a novelty, it may be pointed out that C. autumnale will flower without soil or water if the bulbs are placed, just as they are received, in a sunny window. All the colchicums are valuable for the rock garden in that they give a display of bright blossoms just at the time of year when these are most needed.

One cannot well write on this subject without drawing attention to the fact that there are real crocuses that flower in the fall. These are worth more attention than is usually bestowed on them. One of the best known is C. nudiflorus, which is a native of the north of Spain. This species, which has become naturalised in certain parts of the midland counties, bears bluish purple flowers in September and October. Another autumn-flowering crocus is C. cancellatus, with blooms varying from white to pale bluish purple. This species starts flowering in October and, in a mild winter, will continue in

Digitized by Google

bloom until December. Another very fine species is C. iridiflorus, with brilliant purple flowers which are very distinct on account of the purple stigma. Another fine free crocus is C. speciosus, with purple blooms suffused with darker veins. C. zonatus is also worth growing, with its lilac flowers, which are a bright golden yellow at the base. Practically all these species of autumn-flowering crocuses are of extremely easy culture and, when once established, will increase to a considerable extent. In fact, some of them require watching, as they tend to spread in a garden more than may be desirable.—S. LEONARD BASTIN.

TRITOMAS.

DURING recent years gardeners have begun to realise the value of the tritomas or kniphofias, as they are sometimes called. The flame flower, to give the plant its old-fashioned name, is one of the noblest and most brilliant of the autumn flowers. New species and varieties have been introduced since the common flame flower (T. aloides) was brought to England from the Cape in 1707. Most of these are worth growing, and all succeed under very similar conditions. Probably the original flame flower in its many forms is still the best for ordinary purposes. The plant is very accommodating and will grow in almost any kind of soil or situation, providing the latter is not too heavily shaded. Tritomas are happy in the open border, or in the shrubbery or wild garden, where a certain amount of sunshine can find its way between the bushes. Growers of the flame flower should plan to extend the flowering period. Usually the plants are at their best in September and October, and then, if steps are not taken, the display comes to an end. Now, tritomas, although they will make a brave show even under rather poor conditions, appreciate good living. There is no plant in the garden that will respond more readily to the enrichment of the soil. Just about the time when the clumps are coming into their first flowering, loosen the soil well round the plants with a fork. Then give a heavy top-dressing of rich soil or, better still, well rotted manure. If the weather is hot and dry, soak well with water at least once a day. As the flower spikes fade remove them, cutting the stems at the base. From the heart of the plant there will arise many more flower spikes, which will maintain a wonderful succession of gorgeous flowers. with the coming of rough fall weather it is worth while staking the flower stems, as these are rather brittle and may be snapped off by a gust of wind. Of course, a good deal depends on the season, but in a normal one, without severe frost, there is no reason why the tritomas should not remain in flower until December.—S. L. B.

WHITE ROCK ROSES.

A Few of the Best.

IF Cistus cyprius can claim to be one of the hardiest of the taller rock roses, I always think that C. ladaniferus, one of its parents, is a choicer and more delightful shrub. The former, bearing its white, crimson-blotched flowers in bunches, often blooms so profusely that the effect is marred by being somewhat overdone. But in C. ladaniferus the flowers, yielded singly at the leaf axils, are more moderately disposed, and the upward sweep of the elegant branches, with their narrower leaves of a paler, more grassy green, make an exceedingly attractive setting. The pure white form of this species, known as var. immaculatus, has unblotched blossoms, but in every other respect it is similar to the type. These blooms are exceedingly lovely, and often measure 5ins. across, while the petals, as shown in the illustration, have that crinkly, tissue-papery appearance which emphasises their delicacy and refinement.

Allied to the beautiful C. Loreti, a species which must always be included in the "best half-dozen" white rock roses, is C. recognitus. Mr. W. J. Bean describes this variety as having "unspotted flowers," but the only specimens of that name I have been able to get from nurserymen who specialise in this genus have the coloured flash of C. Loreti. This, however, is not nearly so distinct, being a mere pencilling of vivid carmine outside the basal yellow stain, which latter, by the way, is remarkably golden and a striking accompaniment to the orange anthers. Like C. Loreti, these specimens of C. recognitus carry their large blooms throughout the day and often to next morning. It has a more upright habit and grows taller than the type.

THE PURE WHITE FLOWERS OF CISTUS LADANIFERUS IMMACULATUS.

C. obtusifolius (of the lists) is a useful white rock rose, for it will thrive in quite shady woodland places. Its dark green leaves are wavy at the margins and the white yellow-eyed flowers, which are yielded so abundantly from early June to August, are very effective against the sombre green of the foliage. This is probably a hybrid, and apparently allied to C. corbariensis, itself a natural hybrid. Both are extremely hardy and make compact bushes of about 3ft., but, like most cistuses, they are not long lived and require replacing every few years. This is easily done by plants raised from cuttings in August and put in round about any specimens which show signs of failing. In this way one may avoid gaps.

Of the two tallest rock roses C. populifolius and C. laurifolius, I prefer the latter, which is hardier, larger in the flower and generally more effective. Still, both are well worth a place on open woodland banks or similar situations, and the latter will often produce quantities of self-sown seedlings.

The new C. wintonensis deserves mention here, for it is the only grey-leaved rock rose to bear white, crimson-blotched blossoms. This interesting and pretty little bush is believed to be a hybrid between a cistus and a helianthemum. It is certainly very distinct, not only in the features alluded to, but in the crimson stain which tips the opening buds and which remains as a thin line of colour at the extremity of each expanded petal. All lovers of this beautiful race will agree that this new-comer thoroughly deserves the award of merit bestowed upon it at Vincent Square, where it made its *début* last spring.—A. T. JOHNSON.

THE POPULAR CISTUS RECOGNITUS.

NOTES ON ALPINE CUTTINGS

ROCK garden enthusiasts have yet time to see about increasing their stocks from cuttings, and the following notes may be of some help.

The first consideration is, of course, the frame, and this should be situated so that it gets the sun for the greater part of the day. Where the number of cuttings is not great a two-light frame will be found very suitable. This should be partitioned off so that one half of the frame is reserved for the rooting of the cuttings when they are potted. The section in which the pots of cuttings will be plunged may be filled with sand to within 6ins. of the light, and in the other section of the frame a layer of cinders may be provided to allow a free drainage.

There are several points regarding the cuttings themselves which, though seemingly of little importance, have a definite effect on the results. The first I would mention is the importance of selecting the strongest growths only. It is far better to go to a dozen plants and take one cutting from each than to attempt to take the whole batch from one plant. It must also be borne in mind that long cuttings are not necessarily the best; in fact, the alpine enthusiast is obliged to cultivate the knack of handling short growths.

The pots in which the cuttings are to be inserted must be clean, and after being supplied with an efficient drainage should be filled with a very porous compost. I prefer to use pure sand as the rooting medium, but when this medium is employed it is very important that the cuttings be transferred as soon as possible after they have made roots. Having inserted the cuttings, give them a thorough good watering in, and then plunge the pots to the brim in the bed of sand in the cutting frame. It will be found that these pots of cuttings will not require watering very often before rooting commences, though an occasional spray throughout the day will produce an ideal growing atmosphere. (Use water which is not absolutely cold.) At no time must the sand in which the pots are plunged be allowed to become dust-dry. Other treatment consists of providing slight ventilation on warm days, throwing a shade over the light during sunny periods and (a duty that is too often neglected) removing any rotting leaves.

I consider the rearing of cuttings one of the most interesting duties of a rock gardener, and I certainly think that his interest will be increased if he keeps an account of his results in what I choose to name a "Cutting Book." This is an ordinary indexed notebook, and the entries can be made in a very simple yet concise form, as for example:

Date.	No. of Cuttings.	Plant Name	Date of Potting.	Rooted.
1-7-26	20	Arenaria montana.	5-8-26	19

By keeping such a record it will at all times be possible to determine how long one may expect a cutting to be in rooting and, what is perhaps more important, it will provide useful data respecting the behaviour of different species when treated as cuttings.

W. HOWELL.

A SELECTION OF GENTIANS

(*Continued from page* 435.)

A SPECIES which is a native of Siberia, and first flowered in this country in 1905 is G. Lawrencei. Of the autumn-flowering species of gentians, I find this is not such a robust grower as G. sino-ornata or G. Farreri, and does not increase nearly so quickly, being a more slender plant with thinner stolons and much narrower leaves. The flowers are about 1¾ins. long, funnel-shaped, throat striped pale blue and white. The flowers are very sensitive to atmospheric conditions, and open only in bright sunshine and a warm dry atmosphere.

G. LUTEA.—This is a native of Europe and Asia Minor, and is among the strongest-growing gentian species, attaining 3ft. to 4ft. in height, with leathery leaves of a light green colour. It flowers in midsummer in a very free manner, and when in full bloom is rather a conspicuous object in a border, its size tending to exclude it from the rock garden. The yellow flowers are produced in whorled clusters up the stem among the foliage. The roots of this species are used in medicine. It sets seed very freely, but it takes from three to four years from sowing the seed to make strong flowering plants.

G. PANNONICA.—This is a European species growing nearly 2ft. high. The flowers in whorls are reddish purple on a stout stem, with the lobes of the corolla almost reflexed. Among the gentians, this species is rather outstanding on account of the colour of its flowers, and it is well worth including among any collection of the species. It grows well in good loamy soil, in a sunny position.

G. PROLATA.—This gentian is a native of Bhutan, growing at an altitude of 14,000ft., and flowered at Edinburgh Botanic Garden in 1917 from seed taken from Cooper's Bhutan specimens. It flowers at the same time as G. Farreri.

THE EASILY-GROWN GENTIANA SEPTEMFIDA.

The flowers are about 1½ins. long and are five-lobed, purple striate outside on a yellowish ground, having five bands, one along the middle of each petal, bands marked by three purple equidistant lines; lobes and folds blue. The flowers are produced at the end of the shoots, which are 3ins. to 4ins. long, prostrate, but do not root at the nodes as in G. sino-ornata. This species, with me, seeds freely and has the same habit of excreting its seed capsule from the corolla as G. Farreri and G. sino-ornata.

G. PURDOMI.—This Asiatic gentian, named after the late Mr. Purdom, makes close-lying rosettes of narrow glossy leaves, from which radiate trailing prostrate stems, each carrying about a dozen upturned flowers, violet blue, and freckled with tiny white spots. It grows well under the same conditions as other Asiatic gentians.

G. PYRENAICA, as the name indicates, is a native of the Pyrenees, and has much the same habit as G. verna and flowers at the same time in June. It requires the same treatment. The flowers emerge from a longish calyx in a star of bright violet.

G. SEPTEMFIDA.—No gentian is more easily grown than this species. It is a native of the Caucasus up to 9,000ft. It blooms in August, bearing flowers in clusters on stems about 9ins. high, of a clear soft blue, with the lobes of the corolla cut and jagged and fringy. This species sets a large quantity of seed, which germinates freely and makes good flowering plants within three years.

G. SIKKIMENSIS is a native of north-western Yunnan and the Himalayas, growing on the open pasture lands on the eastern flank of the Tali Range at an altitude of 10,000ft. to 11,000ft. This species is a creeping plant, growing 2ins. to 3ins. high, with narrow leaves clothing

Digitized by Google

the stems, on the apex of which the clusters of flowers appear. The corolla is nearly 1in. long, yellowish white, exterior darker. It is a good grower, forms rather compact tufts in damp soil in full sun, and flowers in September. With me it is a very healthy plant and spreads quickly, but has not flowered yet.

G. SINO-ORNATA.—This is a native of Yunnan, discovered by G. Forrest in 1904 at an altitude of 14,000ft. to 15,000ft. It flowered at the Royal Botanic Gardens in 1912 and received an award of merit at the R.H.S. when exhibited in October, 1915. This species has thick roots, producing many spreading rooting stolons from a primary central rosette, and forms new axillary rosettes at the rooting nodes. The flowers are about the same size as G. Farreri, but are of a rich royal blue, in contrast to the methyl blue of that species. The flowers show all the sensitiveness to light and moisture of most gentians, only expanding fully in bright sun and a dry atmosphere. G. sino-ornata is a late flowerer, starting to flower towards the end of September, and continuing until the winter sends the plant to rest. It is the freest in growth of any of the late-flowering gentians: a small plant from a cutting will increase to a patch a foot in diameter within a year. Although this gentian can be increased by cuttings in the autumn, I find it does best by division in the early spring, when it has made a growth of about 1in. Lifting a plant then and shaking it out, you get dozens of small plants, which, if planted about 6ins. apart, form a solid mass by the autumn. Three years ago I planted a bed 30ft. long by 7ft. wide. This bed is now a solid mass, and about the middle of October it is a wonderful sight, being one solid mass of blue, so free-flowering that you can scarcely see the foliage of the plants. Owing to this gentian flowering so late, it sets very little seed, probably owing to the scarcity of bees to fertilise the flowers. Last autumn I lifted some plants and placed them in a cold greenhouse, and when the flowers opened during a bright day I hand-fertilised them and thereby secured some few capsules of good seed. This seed was sown in the spring, and the seedlings have made good growth after planting out, so that I am looking forward to having them bloom next year, to see if the seedlings will vary in colour and size, as do those of G. Farreri. I find G. Farreri and G. sino-ornata grow and flower exceedingly well in my garden in Perthshire. The garden is at about 700ft. altitude, at the foot of the Ochil Hills, and gets a good deal of moisture in the summer and usually plenty of snow and frost during the winter. They prefer a low position, not perched up on a rock garden, and soil that will grow rhododendrons and azaleas seems to suit them. They will stand full sun if the soil does not get too dry during the summer. I find they rather like a little manure—at least, some clumps growing behind a stone edging in a border in which roses and delphiniums, etc., are planted and which gets manure during the winter, increased very quickly; and where the climate is drier and the sun stronger, such as in the south of England, I believe a position well dug with plenty of manure would help them to grow better.

G. sino-ornata and G. Farreri are very sensitive to changes of temperature. During the day in bright sunshine the flowers are full open; but if the temperature is low and clouds obscure the sun, they immediately close up; whereas if the atmosphere is dry and warm, the flowers are not affected in the same way, and I have seen, in early October, these full open after sunset, when the weather was dry and warm.

G. VEITCHIORUM.—This gentian was introduced into this country by seed collected by E. H. Wilson in western Szechuan, and may be distinguished from the other late-flowering gentians by its habit and foliage. It is a stiffer, more compact grower; the leaves are ovate and blunt at the apex. This plant, with me, is not so free a grower as the others, and does not increase nearly so quickly. The flowers are not quite so large as those of G. sino-ornata, and are a deep purple blue. It comes into flower in September, but is not such a free bloomer as the other late-flowering varieties.

G. VERNA.—This species, with me, thrives on a sunny slope in a well drained stony soil. Collected plants have not done so well here as those raised from seed. The latter make good flowering plants within three years of sowing. This lovely gentian forms compact tufts about 1½ins. high, from which flowers of azure blue spring on stems about 3ins. high. Although a native, it is not so easy to keep well grown, as most of the other species, and is much benefited by a top-dressing of loam and leaf soil after flowering.

A. HARLEY.

GENTIANA VERNA SUCCEEDS ON A SUNNY WELL DRAINED SLOPE.

G. SINO-ORNATA IS THE BEST OF THE LATE-FLOWERING GROUP

CORRESPONDENCE

TOMATO PLANTS UNDER GLASS.

SIR,—In reply to Mr. Geo. Stuart, Edinburgh, page 422, issue July 24th, respecting tomatoes, I wish to say that the sketches were taken from my plants—the variety Ailsa Craig, many plants of which have fruited between each main leaf and zig-zag on the stem, not all on one side. After reading Mr. Stuart's note I again examined the plants and found them as stated. Sutton's Best of All and Dobbie's Orange Sunrise are, as stated by Mr. Stuart, with a few exceptions, where trusses are two leaves apart. Most are on one side of the stem, many zig-zag on the stem.—GEO. GARNER.

A FERN-LEAVED BEECH.

SIR,—The tree in the illustration is a fern-leaved beech, and is the finest known up here. It would be interesting to know if it is a record. The dimensions are as follows: The spread of boughs 186ft. circumference, 77½ft. diameter; circumference of trunk 3ft. above ground, 13ft. The tree, as will be seen, is of good habit.—W. E. SARGINSON, *Windermere*.

IRIS DOMINION.

SIR,—In reply to the note from Lady Algernon Gordon Lennox in THE GARDEN of July 24th, I do not think it can be said that this iris has failed to keep up its great reputation. There are many gardens in which it has flowered well, and these as far apart as Bexley, Kent, in Mr. G. P. Baker's garden, and in Mr. Cuthbertson's garden near Edinburgh, in which, I understand, it is magnificent. It is, however, an iris with preferences, and there are instances of people who have never been able to get it to flower really successfully. Nor is this condition of affairs confined to England, as, in America, whereas Mr. Bonnewitz speaks highly of it as it flowers with him in Ohio, Mr. Wister of Germanstown, Philadelphia, Pa., says he can do very little with it.

Iris Dominion is all that Lady Lennox says of it, and more. I do not think the wonderful velvety texture and rich colour of its broad falls have been superseded, but it was the first of a new race and has certain faults that have been eliminated in its successors. For one thing, the standards are short, dumpy and ill-defined. It has a habit of turning its buds inwards towards the stem that gives it a huddled appearance. In most of its descendants these faults are non-existent. In the limestone soil of sunny Capri all this wonderful race should do well. Any flower with so rich colour and smooth texture is likely to "spot" with rain succeeded by bright sunshine. The reason it has never been more popular is probably because it has been so much in demand for breeding purposes that its price has remained rather high. I strongly advise Lady Gordon Lennox to try some of the following, both in Capri and England, and am certain she will not be disappointed. All are children of Dominion. 1, Bruno; 2, Mrs. Valerie West; 3, Duke of Bedford; 4, Pendragon; 5, Romola; 6, Glamour; 7, Majestic; 8, Moa; 9, Titan; 10, Tenebræ; 11, Cardinal; 12, Swazi. Most of these have all the good characteristics of Dominion without its faults. Some of them attain a height of 3½ft. and throw up six or eight spikes per plant when established, each having several massive flowers open at once. Dominion as a parent is still one of the most valuable irises we have, and if it only bears one perfect flower per year, is worth its place in the garden.—GEO. DILLISTONE.

YELLOW FOXGLOVES.

SIR,—In his article on "Yellow Foxgloves" in THE GARDEN of July 3rd, page 375, S. Arnott says "Digitalis lutea is one of the best of these yellow biennials. It is about 3ft. high and has brighter blooms than the above." Digitalis lutea (*Linné*) is not a biennial but a very persistent perennial with the smallest blossoms of the genus of a poor pale lemon yellow, and is of the type of plant called "interesting," but neither showy nor beautiful. Its usual height in the wild state is 1ft. to 1½ft., and it is a common sub-alpine plant. D. grandiflora (*Allioni*) is the same plant as D. ambigua (*Linné*) and is not nearly so common in the wild state. There is a coloured plate of both D. lutea and D. grandiflora in H. S. Thompson's "Sub-Alpine Plants" facing page 228.—R. J. S., *Tyrone*.

A FINE FERN-LEAVED BEECH.

IVY ON TREES.

SIR,—You do well to call attention to the prevalence of ivy on trees, which seems to be on the increase. Is it that timber is of no value nowadays or that trees of themselves have no beauty in the landscape that owners are so neglectful of their needs? Or is it just the slipshod way so common to our country which neglects the good things we have and imports some inferior substitute? Here the ivy is commonest on the oak because the oak is our commonest tree, and while our cabinet-makers and builders cannot obtain English oak timber with the length of plank and freedom from knots required, they have to import oak from Japan of inferior durability but infinitely better growth. The ivy on an oak tree just outside our grounds has a trunk 6ins. in diameter. Several other fine oaks and ash, too, quite near are smothered almost to the tips with ivy. In my experience, the spruce fir suffers soonest from the grip of ivy, growth being quickly arrested, and as the ivy does not take long to reach the tip the tree is soon killed. Several such trees are to be seen in this neighbourhood. I can find it on most kinds of trees with the exception of the beech, and I notice the growth of the ivy is lightest on those trees which give a heavy shade.—H. C. W., *Surrey*.

LILIUM M. DALMATICUM CATANEÆ.

SIR,—This has proved one of the most illusive lilies I have sought. I have never been quite sure of the plant until lately. Dr. Wallace in his "Notes on Lilies" gives it—on the authority of Visiana—as a variety of Martagon, and then goes on to say that L. Martagon dalmaticum, Malay, is a similar form, or the same. He describes Cataneæ as having flowers of a dark purplish claret colour; dots nearly obsolete. Mr. Groves, on the contrary, speaks of Cataneæ as having flowers that take a lighter colour. He also says that both forms have a mass of white hairs on the unopened buds. Even this feature is not constant, for the first stock of dalmaticum I grew did not show these hairs.

There are three well marked forms of the white Martagon lily: the Dutch white, with the whitest flowers of all; the Lake District white, which has a slight blush tint and with ticks and spots on the back of the flowers; and the creamy white album superbum.

Many years ago I raised a batch of seed from this last. The result was a remarkable variety. The great bulk were just the type Martagon, varying a good deal in the shade and amount of spots. The rest ran all shades from the type to the darkest dalmaticum colour. Some had stripes of this dark mahogany colour down the centre of each petal, others had dark flowers but with light spots of colour in the centre of each petal, some were dark wine colour with the usual spots visible on examination, while others were of the best dark shade. I do not know which of these various forms should be called Cataneæ and really feel the name should be dropped altogether. Dalmaticum was introduced about forty years ago by Max Leichtlin of Baden from Montenegro. Perhaps Cataneæ—a seedling form from it or a neighbour of it—was sent over by the same grower. Anyhow, I think that the very dark forms should be sold as dalmaticum and the various intermediate shades should be grown as mixed or as simply dark forms of Martagon. The wine-coloured *could* be retained as Cataneæ.

It may interest fanciers to know that I have one small bulb which turned up in an importation from Germany which has pure white flowers but with the typical dense spotting in the centre, reminding one of Lilium Farreri. Unfortunately, it will take years before it can be shared round.—JOHN STORMONTH, *Kirkbride, Cumberland*.

AN ENQUIRY.

SIR,—I grow a number of Darwin and cottage tulips for market, which are taken up and divided every second year. About half of these "break," while others in a herbaceous border, which are seldom moved or picked, practically remain true. Is this the general experience of market growers, and can you suggest any remedy?—T. M. C.

FRUIT AND FLOWERS AT WESTMINSTER

THE exhibits were varied and the attendance small at the fortnightly meeting of the R.H.S., held on July 27th and, although gooseberries should have been the main feature of the Show, there were only three exhibits of this fruit. Many fine herbaceous phloxes were to be seen, gladioli and hardy perennials were also well represented, but on the whole the solitary exhibits, such as those of aquatics, scented pelargoniums and annuals were the most interesting.

An excellent collection of gooseberries and currants was put up by the fruit specialists Messrs. J. C. Allgrove. Dishes of fruit and also bushes growing in pots were shown, and from an exhibit of this kind the cropping powers as well as the size and quality of the fruit can be judged. The gooseberries Leveller and Langley Gage and the red currant La Constante were bearing very heavy crops of good-sized fruit.

Mr. F. C. Stoop showed over thirty varieties of gooseberries, and his dishes of the varieties Ironmonger, Warrington and Colossal were in perfect condition. Gooseberries were also shown by Mr. H. Hemsley.

At one end of the hall the massed group of scented pelargoniums exhibited by the Hon. Vicary Gibbs and raised by Mr. Edwin Beckett was a really fine collection, and showed great skill in cultivation. There were varieties, such as Lady Plymouth, with light-coloured foliage, others with variegated foliage, while some had dark green and finely divided leaves.

Mr. Amos Perry's collection of aquatics was both interesting and unique. True water-loving plants as well as numerous uncommon bog plants were exhibited, and among them were parrot's feather (Myriophyllum proserpinacoides), an excellent plant for an aquarium; the attractive floating water hyacinth, Eichornea crassipes major; Thalia dealbata, with its massive palm-like foliage; and the true bulrush, Scirpus lacustris.

A large and well arranged group of vegetables was staged by Messrs. Barr and Sons. Fine specimens of the carrot Barr's New Intermediate, the dwarf bean Barr's Excelsior and a number of herbs were included.

Good strain and good cultivation are two essential features to be considered when growing annuals. Messrs. C. S. Daniels and Son's exhibit of annuals bore evidence of both these features, and their robust, large and brightly coloured flowers could in no way be compared with the straggly, indifferent annuals which one frequently sees. Their godetias and larkspurs were particularly fine, and the varieties of godetia named Duchess of Albany and Double Rose perhaps the best.

Herbaceous phloxes as shown by Mr. H. J. Jones made an imposing group. Modern phlox varieties are vivid and striking in colouring, and many of the finest have been raised by Mr. Jones himself. A few of the outstanding varieties in his group were Mrs. Askew, beautiful salmon pink; Mrs. G. A. Agnew, soft salmon-cerise; September Glow, brilliant red; Mrs. Rutgers, rosy lilac; Mia Ruys, pure white; and Eugene Danzanvilliers, light mauve.

The fact that the gladiolus is one of the finest of all flowers for house decoration was ably demonstrated by Messrs. Kelway and Son, who staged numerous vases filled with massive spikes of this increasingly popular flower. The grace, elegance and brilliancy of colouring, particularly of Messrs. Kelway's Langprim hybrids, could not fail to be appreciated. Lady Joan Verney, Mrs. Swainson, Rev. J. Stubbs of the hybrid gladioli, together with Palestine and J. W. Kelway, both large-flowered varieties, were outstanding.

Messrs. Hewitt's gladioli and perennial phlox were in fine form. The glowing orange-scarlet large-flowered gladioli Rubini and the primulinus hybrid Lætitia were two of the best varieties. Mr. H. Hemsley showed a number of his new sidalceas in various shades of rosy crimson. These are the results of many years of plant breeding. Another grower who exhibited plants of his own raising was Mr. Isaac House. New perennial scabious in shades of blue, mauve and lavender were exhibited by him.

One of the most useful of yellow-flowered hardy perennials, Coreopsis auriculata superba was shown by Messrs. B. Latham. Lavatera Olbia rosea was also conspicuous on this stand.

Carnations, chiefly of the perpetual type, were exhibited by three firms—Messrs. Allwood Brothers, Messrs. C. Engelmann and Messrs. Stuart Low and Co. Red Laddie, shown by Messrs. C. Engelmann, was exceptionally fine in colour and form.

Roses came from Messrs. D. Prior, who had good blooms of Little Joe, C. E. Van Rossem and Allan Chandler.

Hardy plants, alpines and shrubs were exhibited by several of the leading firms. Messrs. Tucker and Sons had a patch of the quaint Campanula Zoysii in their miniature rock garden. Meconopsis cambrica aurantica shown by them was flowering well, and Campanula pseudo-Raineri was covered with its saucer-like blooms of clear blue. Mr. F. G. Wood, among his group of hardy perennials, had a few plants which in the wild garden make a splendid show; for instance, there was Lythrum virgatum roseum and Liatris spicata. Lilies, pentstemons and summer-blooming plants for the rockery, such as the vivid Verbena chamædryoides, Campanula Stansfieldii and Gentiana Freyniana were shown by Mr. M. Prichard. Ryburgh hybrid double poppies and herbaceous plants came from the Chalk Hill Nurseries.

Several interesting shrubs, all flowering well, were shown by Messrs. R. Veitch and Son. Desfontainea spinosa, Feijoa Sellowiana, Lagerstrœmia indica, Eugenia apiculata, and fine specimens of Lonicera Hildebrandti and Eucryphia pinnatifolia were among them. Messrs. G. Reuthe staged a miscellaneous collection of shrubs and hardy plants. Spiræa Bumalda and Passiflora cœrulea were noted. Messrs. L. R. Russell had several fine plants of Erythrina Crista-galli, the coral tree, and Sollya heterophylla, the dainty Australian bluebell creeper.

NEW AND RARE PLANTS.

AWARDS OF MERIT.

ALLIUM DESCENDENS.—A tall, striking-looking species which bears on wiry stems terminal umbels of deep purple flowers forming a tightly packed globular head. Shown by Mr. R. C. Notcutt, Woodbridge, Suffolk.

CEANOTHUS HENRI DEFOSSE.—A floriferous and attractive variety of this ornamental shrub. The trusses of deep indigo blue flowers are darker in colour than any other form of the type. Shown by Messrs. R. Veitch and Son, Exeter.

CRINUM CONCINNUM.—A large Peruvian species of this bulbous plant which is flowering for the first time in England. On a thick and fleshy stem of about 2ft. in height is borne a loosely arranged umbel of twelve to eighteen flowers, some fully open, others in bud. Each petal is from 4ins. to 6ins. in length, white in colour, banded with crimson down the centre and faintly flushed with the same colour. The broad sword-shaped leaves are almost 2½ft. long. Shown by Major Albert Pam, Broxbourne.

ESCALLONIA IVEYI.—Clusters of white flowers tinged with flesh pink at the base are borne by this evergreen shrub. The foliage is neat, dark green and glossy. This shrub appears to be a strong grower and very robust. Shown by Messrs. R. Veitch and Son, Exeter.

PHYGELIUS CAPENSIS VAR. COCCINEA.—A small, showy, tender shrub from the Cape of Good Hope. The pendent tubular flowers are a glowing orange scarlet, and the lance-shaped leaves are small and dark green. Shown by Mr. Clarence Elliott, Stevenage.

PHLOX ROYAL PURPLE.—A phlox of distinct colouring, being a dark violet blue with a deeper eye. The trusses are large and much branched. Each pip is of medium size. Shown by the Hon. Vicary Gibbs, Elstree.

SCABIOSA ANTHEMIFOLIA ROSEA T. HAY'S VAR.—A perennial species of the pincushion flower with large, well formed flowers of rosy mauve on stems of 2ft. in length. Shown by Mr. Isaac House, Westbury, Bristol.

ORCHIDS.

SOPHRO - LÆLIO - CATTLEYA PRUDENCE (S.-L. Læta × C. Fabia).—So far as coloration is concerned, this hybrid probably excels all others in its section. The spike bore three flowers of moderate size of purplish rose colour, but with a rich over-tint of ruby crimson, the labellum having a deep crimson zone round the margin, while the throat is effectively veined with dull gold. Exhibited by Lieut.-Colonel Sir George Holford, K.C.V.O., Westonbirt, Tetbury, Glos. Award of merit.

ODONTIODA ESME (Oda. Manora × Oda. Red Cross).—A charming novelty with a spike of eight neatly formed flowers of bright reddish rose colour. From Messrs. Charlesworth and Co., Hayward's Heath, Sussex. Award of merit.

VANDA HERZIANA (cœrulea × suavis).—An interesting hybrid in which the flower is of an obscure rose tint, but with bright bluish markings derived from the former parent. It does not appear to be so free growing as V. suavis. Shown by Messrs. Charlesworth and Co., Hayward's Heath. Preliminary commendation.

ODONTOGLOSSUM CLEOPATRA VAR. MEMORIA LIONEL CRAWSHAY.—This plant was a fine example of successful cultivation, the branched inflorescence having no fewer than fifty-three buds and flowers. Staged by Messrs. Sutton Brothers, Hassocks. Cultural commendation.

CŒLOGYNE SANDERIANA.—A well grown specimen with nearly a hundred flowers was staged by Mr. H. T. Pitt, Rosslyn, Stamford Hill, and received cultural commendation. The species was introduced from the Sunda Isles, and the flowers are white, with some yellow on the lip.

Mr. H. T. Pitt, Rosslyn, Stamford Hill, staged a very interesting group, and a really fine one for the period of the year. Cattleya Warscewiczii was represented by the pretty variety known as Mrs. E. Ashworth, and by another variety called F. M. Beyrodt, which has pure white flowers except for some bright purple on the lip. Maxillaria venusta, with four flowers, and Dendrobium Dalhousieanum were both attractive, while others that caused attention were Angræcum Scottianum and Odontonia Olivia with yellow flowers marked with brown. Cypripedium Enchantress with yellowish green flowers stood out prominently, as also did C. St. Alban, of dark crimson-red. Silver-gilt Banksian medal.

FRUIT AND VEGETABLES

MILDEWED FRUIT.

Strawberry Diseases.

IN strawberry fields nothing is more characteristic than mildewed plants which can be spotted from quite a long distance by means of the peculiar turning back of the leaves so as to expose the under surface. The attack is always serious, but most serious in new plantations, for growth and development are considerably affected; sometimes, too, the fruit is affected and rendered unsaleable. Leaf-spot is always more prevalent in dry, porous and fiery loams. Close examination of the leaves reveals dark red spots; equally observable on both sides of the leaf, these enlarge, and the centre becomes a greyish white colour, the spot then appearing like an "eye." By upsetting the feeding system of the plant, this disease is a bad enemy to successful cropping. A third disease, often misnamed mildew, affects the fruits mostly, covering them with a grey mould and inducing early rotting. This mould, a species of botrytis, is invariably worse in warm and damp or wet seasons, and varieties bearing weak stems and heavy crops always suffer most; contact with wet soil or wet straw encourages the disease. So far it has proved a very difficult matter to eradicate any of these diseases. Lime-sulphur, 1 in 50, if repeated at 10 days' intervals, is fairly effective, but the impossibility of spraying thoroughly such low-growing plants as strawberries negatives much of the work. Dusting with a mixture of ground lime and sulphur is fairly effective early in the season, but, of course, impossible when fruits appear. The plan we favour most—a drastic one—is best of all: the plants are cleared of all bedding material, then the leaves are clipped off and left as they fall. After they have dried for a few days the bedding material, also dried, or some hay or straw is laid thinly over the bed and the whole set on fire. Supervision to see that all parts receive this fire treatment equally is required and at the finish all straws left are brushed up lightly with a broom and burned. If this treatment is carried out just now the plants come up fresh and green by the autumn and entirely free from any of the diseases. Growers should be particularly careful in regard to new runners.—LANARKSHIRE.

ONIONS.

Lifting and Storing.

AUGUST is the harvest month with the grower of onions, as it is the time for lifting the bulbs. In the first or second week, according to the progress they have made, he will give the necessary twist to the necks of the finest specimens, about which he may have had misgivings earlier in the season, but which, with feeding and hoeing, have helped on a bumper crop. I always feel more satisfied when I have gathered in the onion crop than almost any other. Perhaps it is because they have demanded unremitting care and attention from the day I sowed seed in boxes in the house on what seems now to be a far-off January day, and all through the weeks after planting in beds, weeding and hoeing, with feeding and watering, seemed to monopolise so much time.

One hardly needs to be reminded that, in turning the heads inwards and in raising the roots with a fork, it is only to aid the quicker ripening, preparatory to lifting the bulbs on that fine day which is so needful for the work, but which has sometimes to be undertaken under less favourable conditions. Nor is it necessary to say more than that, when the bulbs are taken from the bed, they should be carefully handled so as to avoid bruising them, storing them finally in a cool dry place in single layers, which is calculated to keep them in the best condition for the longest period.—CLAREMONT.

A USEFUL GREEN FOOD.

Corn Salad for Winter.

CORN salad, or lamb's lettuce is of greatest value in winter and spring, when other green things are scarce. It is very hardy, and may often be found growing wild in cornfields and under hedgerows.

A good sowing may be made at this time, in rows 6ins. apart, and the seedlings thinned to half that distance in the rows. A warm sheltered border is best for them, a porous light soil, and the plants will be active at any spell of suitable weather throughout the winter. Although the leaves may be cooked, we find them figuring most often in green salads. A very fine salad is known as *salade de mâche*, a French concoction (corn salad is better known in France than in this country). The plants are pulled up, the roots cut off and the leaves well washed in water; to a pound of the leaves a little sliced beetroot is added and a little celery or cooked celeriac in chips. These are mixed thoroughly together, seasoned with salt and pepper, and a dressing, consisting of equal parts of oil and vinegar, a tablespoonful of each, added.—LANARKSHIRE.

MAKING THE MARROWS KEEP ON.

IF, as sometimes happens towards the end of the summer, the weather becomes wet and cool, the effect on the marrows is almost immediate. Like all the gourd tribe, marrows are the children of the sun and, without the warm rays, they find difficulty in setting and developing their fruit. In cold rainy weather many a young marrow which has started well will turn yellow and finally rot away altogether. This is nearly always due to one thing which it pays the grower to bear in mind. In hot dry weather the withered flower at the end of the marrow shrivels up and drops away very quickly. If there is much damp about there is a tendency on the part of the flower to hang on. Owing to the cool weather the young marrow is not growing quickly enough to push the dead bloom out of the way. As a result the moist petals of the flower become the starting point of mould growths, and these fungi rapidly infect the marrow itself. The end of this is that everything goes wrong and the marrow never lasts long enough to grow to any decent size.

The remedy for this trouble is to watch the young marrows. A day or two after the fruit has set, pull the dead flower gently. Do not use any force, but, as soon as the bloom can be easily pulled away, remove it altogether. Many marrows may be saved by following this simple plan.

Of course, the late summer may be hot and dry, and then the marrow plants may flag simply owing to lack of water. Here liberal soakings will help very much to keep things going. Unless there is any special reason, resist the temptation to leave some large marrows on the vines just to see how big they will get. Plants that are occupied in maturing fruit in this way will cease producing new marrows, which, after all, will be the most useful. Another good tip at this time of the year is to pinch away the ends of the shoots, which often grow with great vigour and waste energy that is much better employed in filling out the growing marrows.—S. LEONARD BASTIN.

FLOWER GARDEN AND GREENHOUSE

FREESIAS.

THAT the Royal Horticultural Society is holding a trial of freesias is, I think, a sign of the times. I hope a real good collection of varieties will be sent, old and new, and the inferior as well as the best, so that they can be compared and the former discarded in favour of the latter, and so reduce the number of named sorts to those that are really worth growing. Like a horse, it costs no more to keep a good one than a bad one; so with freesias, it costs no more to grow the best than it does to grow the worst. And they are grown so very easily—even a cold frame, which can be covered to exclude frost, can grow them. Some of my best flowers are grown in frames, planted out in the soil; a single 3in. pipe runs through the whole length, 80ft., and is only used in very cold weather, and then I turn on heat as much to prevent the pipes freezing as to protect the freesias.

They get no water from start to finish, there being sufficient moisture soaking in to keep the rooting area moist enough. Anyone with a good frame or a small greenhouse can grow them. I do not think that their decorative value is as fully realised and appreciated as it should be: they are such good flowers for cutting, many varieties have fine long stems, as stiff and strong as wire; and they last so well in water. The dwarfer sorts should be grown as pot plants, and, of course, they will last longer still. Early potting is best—that is, as early in August as you can get them; and, judging from my own results, the ripening is much later this year, owing to lack of sunshine during May and June. Anyhow, pot them in August if you can, or, at any rate, in September. I never keep any after October 1st. Last season I had to grow the stock of a new variety for the owner and it was not potted or planted until November. The pot plants were a bit later than some August-potted plants, but they were all shown at the R.H.S. in April, in first-class condition.

As to compost, I personally use a light sandy loam, an extra liberal lot of coarse sand, and extra well crocked pots, which ensures quick drainage. A little bone-meal is used in the compost, and other manure, in the form of liquid cow-manure, is used later, when the roots require and can use it.

A noted freesia grower—alas! no longer with us—used to use much leaf-mould: it appeared to be quite 75 per cent. of the compost, and even more. Personally, I never use it at all and, judging by my results of flower and corm for 1926, it seems quite unnecessary to use it.

Six corms to a 5-inch pot (48 size) is what I advise, and ten to a size larger. I prefer to put more in a pot rather than less, and results justify this.

As soon as the corms are potted, I place all pots in the freesia house, giving full air and keeping them as cool as is possible at this season. By so doing you can keep the watering under control. Placed in the open, you can control the water-can but not the rain, and the pots may get too much of the latter. A cold frame will do, giving plenty of air, and on no account covering the pots with ashes, fibre, etc. This only tends to produce weak growth at the start.

Water sparingly, but give enough to start and maintain root action, otherwise growth may not start at all.

I prefer to feed the plants when they are forward enough to require it, and not to use manure, other than bone-meal, in the compost. I always think so much of the nutriment gets

Digitized by Google

washed out with watering long before the roots get to it or require it.

Stake the plants before they get too tall, not because they are weak-stemmed, but because when they reach a certain height they are apt to over-balance. I advise Allwoods' carnation wire rings, which last for years. I am using now rings which I bought in 1914. (This is a good testimonial to their durability). I find that the coloured varieties come stronger and better in colour if grown as cool as possible and not forced. And now as to what sorts to grow.

For pots, Apogee and Jubilee are first-rate, being sturdy and dwarfer than most sorts. All are good for pots, and most are good for cutting as well. For the latter I strongly recommend Buttercup, Conquest, Mouette, Cream Cheese and, especially, Golden King—an old variety now, and the flowers on the small side, but a rich colour, very stiff stems and a wonderfully strong scent, and it flowers last of all, with Cream Cheese.

Freesia raising is a quick job compared with many other flowers, for they can be had in flower in eight months from sowing, but, of course, the flowers and spike will be on the small side and should not be judged until the second year. Some varieties set seed freely, others set none and are very difficult to set seed by hand or by cross pollinating, and generally in the latter case they are the better varieties that one particularly wants to get seed from.

There is much more I could write about on freesias, but time and space forbid, and we must wait and watch for the trials and the results.—G. D.

SUMMER BEDDING PLANTS.

How to Propagate Them.

THESE include many kinds, but only those that are increased or preserved through the winter by the propagation of cuttings are dealt with in this note. Two kinds of compost will be needed: one of fibrous loam 2 parts, leaf-soil 1 part, with plenty of sand added; and the other, fibrous loam 1 part, leaf-soil 2 parts, also with a free addition of coarse sand. The first-named compost should be used for zonal, ivy-leaved, and sweet-scented pelargoniums, calceolarias and similar kinds of plants. The lighter compost

A SPRAY OR CLUSTER OF TERMINAL BUDS.

will be most suitable for such plants as fuchsias, heliotrope, lobelia, verbenas and similar plants. The cultivator should, therefore, prepare two separate heaps and retain them under cover until the soil is being actually used. Where it is difficult to obtain coarse sand, use old mortar rubble instead; a small quantity, mixed with the sandy compost, will do good. Its presence encourages root formation and helps to keep them healthy, when they do good. With few exceptions, inserted cuttings do best until the end of September under well tilted lights in a cold frame. Do not select the very hard nor the very sappy wood for cuttings; that of medium firmness is the best. Boxes and pots are the most suitable for cuttings in general; pans for certain kinds, such as those of small growth and used for edgings. Boxes should be made to last and to keep free from fungus. To this end, nail strips of wood, *a*, on the bottom of each box, and make several drainage holes, *b*, in the box, too. Cut off stem, *c*, and bottom leaf, *d*, when preparing the cutting, even in the case of small ones, shown at *e* and *f* respectively.

Having prepared and filled the pot or box, make holes with a blunt dibber, *g* and *h*; insert the cuttings as shown at *i*, after removing the stem scales, *j*; *k* shows the drainage material on the crocks, and *l* and *m* new roots growing before winter comes.—G. G.

TAKING CHRYSANTHEMUM BUDS.

MANY varieties of chrysanthemums have produced flower buds persistently since the middle of June. No doubt, last year's weather and the conditions under which the plants were grown have had some effect on the current year's growth. The dark-flowered varieties are the worst offenders in the matter of premature bud-forming. But the buds of certain sorts, such as those of Mrs. G. Drabble, William Rigby, Queen Mary, Princess Mary, Majestic and Victory, if taken any time during the last half of July, will develop into big blooms from October 25th to November 10th. The great majority of varieties, such as Mrs. R. C. Pulling, which is taken as a guide, will show their buds from July 25th to August 20th, and if the buds are gradually "taken," that is, retained, while the shoots growing immediately below are removed, one or two each day, until all are pinched out, the resultant blooms should be large, refined and open at the end of October. Practically all buds so dealt with are crown buds—buds surrounded by young shoots. The next batch of buds will be the final, or terminal, ones, and the central one is retained while those buds—not shoots—surrounding it are removed. The big single flowers are taken as in the case of crown buds. The later and more refined singles are the ones resulting from buds being taken nearer the end of August, and in the majority of cases they are terminals. —GEORGE GARNER.

VIOLETS: MID-SEASON DUTIES.

IN a few weeks hence, we shall be concerned with finding provision under cold frames for violets which have been quartered in the garden since April, but before that time arrives help should be given them in the administering of weak manure water twice a week; in syringing the plants in the evening after hot days; in stimulating them further by applying soot water occasionally; and in generally looking after them by continuing to pinch out runners as they form. It is in the nature of a violet to be perpetually throwing out runners in the summer months, and unless these are stopped one cannot get fine crowns serviceable for lifting into frames, or look for plenty of fragrant blossoms. Unfortunately, at the time of planting the runners in spring, position is not always studied, and it comes about that the plants are exposed to all the heat of summer, without the slightest shade to help them. The ideal spot for violets is a north position where the sun is off in the afternoon, and where they will get a chance of recuperating. The next best position is between rows of peas or beans or other tall-growing plants. Towards the middle of September, according to weather conditions, clumps should be planted in frames with a minimum of root disturbance, but the lights ought not to be entirely closed, the old practice of admitting air at top and bottom being observed. In dry weather, while still out of doors, a watch should be kept for red spider and frequent syringings resorted to.—CLAREMONT.

THE MOST DELIGHTFUL FLOWERS FOR POTS OR FOR CUTTING.

BUY and TRY a few!

I can supply the following varieties : per doz.

	s.	d.
Apogee, a very strong grower of good habit, not so tall as most. The flowers are very large, of good shape, and a soft primrose yellow. One of the best varieties. A.M., R.H.S.	5	0
Bluebeard, of a stiff, wiry growth. This variety makes a very good pot plant. Flowers of moderate size, are of a blue-mauve shade with brown markings in the throat	6	0
Buttercup, a strong, tall grower, and one of the earliest to open. Large flowers of a rich primrose yellow with a deep orange lip. A.M., R.H.S.	4	0
Conquest, a strong and very free-flowering early variety. Rose pink, a charming colour	7	6
Cream Cheese, a tall late-flowering variety with pale primrose flowers, a fine variety for cutting	7	6
Golden King, a strong grower, flowers of medium size, of rich golden yellow, very free flowering, with extra strong, stiff stems. Has a very strong scent, and is one of the last to flower. A.M., R.H.S.	4	6
Jubilee, of dwarf habit. Massive flowers of great substance, creamy white, suffused with carmine outside. An excellent variety for pots	6	0
La Charmante, a strong grower of medium height. It opens an apricot shaded with pink, turning to rich copper colour	8	6
La France, an early-flowering variety, free-flowering large well shaped open flowers of a delicate mauve with a white throat. A.M., R.H.S.	4	6
Mouette, a vigorous grower, tall spikes of large open flowers of creamy white suffused with pink, outside a deeper shade of rose	6	0
Preciosa, of medium height, fair-sized flowers of lavender-blue with white throat	5	0
Treasure, the largest flower of all, bright yellow with a few dark lines in throat, and a slight shading of mauve outside. A.M., R.H.S.	5	0
Wedgewood, a dwarf grower with soft blue flowers, a good variety for pots	10	0

G. H. DALRYMPLE,

THE NURSERIES, BARTLEY, SOUTHAMPTON

OBITUARY

THE REV. J. H. PEMBERTON.

THROUGH the lamented death on Friday, July 23rd, of the Rev. J. H. Pemberton the National Rose Society lost one of the last of that famous circle of clergymen rosarians who during the "Dean Hole" era were its stalwart supporters and untiring workers. The Rev. Pemberton was really great among rosarians, a clever grower, an able and successful exhibitor, keen and just judge, and a raiser of considerable renown. His energy and enthusiasm was directed to the welfare of the National Rose Society and the advancement of rose culture, and at the provincial shows of the Society as well as at its London shows he was a regular attendant who always helped by practical means to make the displays worthy of the great organisation which he had been instrumental in making so strong and important.

The Rev. Pemberton was president of the Society in 1911–12, the year of the great International Horticultural Exhibition, and he was the first recipient of the Dean Hole medal, which was awarded him by unanimous vote in 1909. The reverend gentleman first won the Society's Champion Challenge Trophy in the year 1885, repeating his success the following year and again ten years later. At the northern shows he won the Jubilee Challenge Trophy in the years 1889, 1890, 1891 and 1896. The first success with a new rose was, we believe, with the charming variety Moonlight, which was awarded the gold medal in the year 1913. The following year Clytemnestra secured a gold medal, and in 1918 the beautiful hybrid musk rose Pax brought still another award; and since that time quite a number of very delightful new varieties of great decorative value have been introduced by the firm of J. H. Pemberton, for the deceased gentleman had of recent years entered the ranks of trade growers.

A man of great scholastic attainments, the Rev. Pemberton was author of an important work entitled "Roses, Their History, Development and Cultivation." He was, indeed, a man of exceptional versatility, quiet and unassuming in manner, but full of profound knowledge, which was readily imparted to those who sought it, but never ostentatiously paraded. He believed in the uplifting influence of beautiful roses and in the benefits accruing from the personal cultivation of good roses and of the good sportsmanship of the rose show, and was not content merely to engage in the occupation himself, but worked steadily and enthusiastically in the endeavour to induce others to grow and show roses.

The National Rose Society suffers a grievous loss and British horticulture is the poorer through the death of the Rev. J. H. Pemberton.

MR. FRED VERT.

WITH tragic suddenness death snatched Mr. Fred Vert of Saffron Walden, on Tuesday, July 20th. Only forty-five years of age, Mr. Vert was apparently in robust health and full of energy, and visited London on business as recently as July 14th. On the following day, however, he had to go to Cambridge for medical attention, and an immediate operation of a serious character was found to be necessary. The operation itself appeared to be successful, but complications followed which proved fatal, and a hitherto strong young man passed away, at 2.30 p.m. on Tuesday.

Fred Vert was the son of Mr. James Vert, well known as a judge at the leading horticultural shows in the country, and as headgardener to Lord Howard de Walden, formerly at Audley End and more recently at Chirk Castle.

Under his father's able tuition and guidance Fred Vert became a keen horticulturist, and for a considerable number of years he has ably controlled the nursery and seed business of J. Vert and Son, with its specialty of the world-renowned Chater's strain of hollyhocks. The collection, under our departed friend's care, had attained even greater perfection than of old, and several new varieties of sterling merit have been introduced to commerce during Vert and Son's occupation of the nurseries. Hollyhocks were but one feature of these nurseries, for Mr. Vert was a first-class all-round plantsman, and has developed the tree and shrub departments and greatly extended the production of all kinds of fruits, pot-grown collections of which he exhibited in fine style.

Hale and hearty, full of good spirits and geniality, Fred Vert was the friend of a wide circle of both commercial and private horticulturists who will be grievously distressed to learn of his untimely removal from our midst.

A. J. M.

NEW CARNATIONS

(*Continued from page 441.*)

EDITH.—Registered by Mr. A. J. Pointing, Appleton Nursery, Bulpham, Essex. Ward × Triumph. Purple; 3–4ins.; fragrance strongly scented; habit and stem good; calyx very good.

STARTLER.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Orange scarlet; size 3ins.; scented; habit and stem very free; stems erect and strong.

CITRON.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Lemon yellow with few pink stripes; size 3½ins.; no fragrance; habit and stem good; strong wiry stems.

PALETTE.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Yellow ground overlaid with pink and apricot; size 3½ins.; no fragrance; habit good and stem fair.

DORCAS.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Crimson; size 3ins.; very strongly scented; best type of perpetual-flowering habit, stems good.

VESTA.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Dark rose pink; size 3ins.; scented; good habit, dwarf grower, strong, erect stems.

BRENDA.—Registered by Messrs. C. Engelmann, Saffron Walden. Seedling. Red, shaded crimson; size 3½–4ins.; good scent; good habit, wiry stems.

KATJA.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Mauve; size 3ins.; fair fragrance; habit good, strong stems.

HEBE.—Registered by Messrs. C. Engelmann, Limited, Saffron Walden. Seedling. Deep salmon pink; size 3½ins.; good fragrance; good habit, strong stems.

BRILLIANT IMPROVED PAGES.—Registered by Mr. W. H. Page, Tangley Nursery, Hampton. Parentage Brilliant, Scarlet; 3ins.; medium fragrance; habit and stem good.

WE much regret that a printer's error occurred in a note on hydrangeas in the issue of July 10th, page 395. It was stated that a fine bloom could be obtained from rooted cuttings in about two months. This should read "in ten months."

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them now. Either buy the low-priced collection of excellent varieties offered below for 7/6 the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque ..	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty ..	Pale rose and deep red.
Lohengrin ..	Cattleya mauve.
Mdm. Chereau ..	White, frilled azure blue.
Mrs. H. Darwin ..	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme ..	Pure blue and blue purple.
Prosper Laugier ..	Bronzy cinnamon and velvety crimson.
Rhein Nixe ..	White and violet purple.

One plant each of the 12 varieties, 7/6 post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

COOPER, McDOUGALL & ROBERTSON, LTD. - - BERKHAMSTED, HERTS

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE FLOWER GARDEN.

During the present month the plans for next year's summer bedding should be given consideration, so that the necessary plants can be propagated. The approximate number of Paul Crampell and ivy-leaved pelargoniums can be ascertained, and preparations made accordingly. These cuttings will readily root in a cold frame, or on a greenhouse shelf. Fuchsias and heliotropes may be increased in the spring, but a few stock plants should be well established in pots before the winter, the same applies to coleus and a few other subjects. If standard fuchsias or heliotropes are required, they should be grown on now in a cool greenhouse, then good specimens will be available next May.

Climbing Roses.—Climbing varieties of the Dorothy Perkins type, trained on pergolas, walls, poles, etc., have finished flowering and the annual pruning may be done. This will allow more light and air to the strong growths pushing up from the base and other parts of the stems. Cut out a number of the old flowered branches, and cut back others to a strong new shoot. Feed the roots with liquid manure and mulch with partly decayed manure. See that the poles are secure, and use good quality tarred twine for tying purposes. This will save a lot of trouble later on.

Bulbs.—It is rather early to think about the general planting of bulbs, but I always like to get them in as early as possible. Many bulbs, I believe, are planted too late to obtain the best results. Narcissus and tulips that were forced and duly dried off will be set out in the grass directly the ground is soft enough to use a bulb planter. Other bulbs to plant now include the snowdrop, crocus, Anemone apennina, squills and the winter aconite. The latter annually makes a fine show under some beech trees, and this also applies to the squills, both of which are never disturbed. Many of the bulbous irises of the I. reticulata group could also be planted.

Pyrethrums.—Both the double and single pyrethrums are valuable border plants and for cutting purposes, but, unfortunately, slugs are very partial to them, and these pests are responsible for many failures. Plenty of lime should be placed round the plants, at intervals where slugs are troublesome. A stock of useful varieties can be raised from seeds, and there is still time to sow them to secure flowering examples next year.

THE HARDY FRUIT GARDEN.

Raspberries.—When the crop from the summer fruiting kinds has been gathered, the old canes should be cut out at their base, and burnt. With strong clumps, a number of the new ones must be removed to prevent overcrowding, six or seven of the strongest being enough for one stool or root. At the same time, the plantation is cleared of weeds and thoroughly hoed.

Loganberries.—These are strong-growing and always make plenty of new growth. Directly the crop is finished, remove all the old fruiting shoots and replace them with fresh growths. Make all the supports safe before tying begins. Both the loganberries and raspberries will benefit if afforded a mulch of manure between the rows, especially if this has been omitted for a year or two.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE FRUIT GARDEN.

Strawberries.—As soon as the crop is harvested and sufficient runners taken for future plantations, all weeds, superfluous runners, old bedding litter and large old leaves should be cleared off. If strawberry leaf spot, characterised by circular brown or red spots, later with white centres, has appeared, it can be dealt with now, if it is not convenient to renew infested plantations. Cut off all the leaves and allow these and the rough clearings to dry somewhat, and burn them, assisting by spraying with petrol or paraffin if necessary.

Experiments have proved this to be the most advantageous time to apply dung to strawberries to obtain the greater quantity of production. As the crowns to produce the following year's crop are built up in autumn and winter, manuring deferred until spring will increase the size of the berries, but will have little influence on the quantity of the crop.

Raspberries.—The majority of growers are in agreement as to the advantages accruing from cutting out the old fruiting canes soon after fruiting is passed. Retain sufficient strong young canes to furnish the trellis, or according to the method of support given. Meantime, loosely tie selected canes for safety, and remove discarded young canes with old growth.

The pupæ of raspberry weevils and beetles and the caterpillars of the raspberry moth hibernate in the soil. Sprinkle sand or sifted ashes saturated with paraffin or 1 part naphthalene to 10 parts ashes or slaked lime around the stools. This will at least lessen the labour of spraying and trapping for the destruction of the adults in the following spring and summer. Afterwards give a mulching of good yard dung and lightly fork it in.

WORK IN THE FLOWER GARDEN.

Cuttings of double arabis, aubrietias and seedling polyanthus will now be sufficiently well rooted to bear transplanting from frames to the open. A piece of ground cleared of potatoes or turnips, lightly forked over, will suit. Put in the plants 6ins. to 9ins. apart each way, water in dry weather until root growth is active, and pinch frequently to form bushy plants.

Narcissus in beds or borders which have been planted for four or more years will be observed to produce fewer and smaller flowers. The obvious remedy is to lift and replant the bulbs. If possible, replant in fresh soil with old cow-manure added, planting the bulbs 6ins. to 9ins. in depth—12ins. will do no harm if the ground has to be planted with summer or autumn flowering subjects.

The delivery of catalogues is a constant reminder of the attention required in compiling and posting the bulb order. This should be done early to ensure delivery of selected sorts, and for other reasons. In spring bedding schemes for northern counties the early-flowering tulip is most in favour, owing to the May or Darwin being late in flowering and so delaying the summer bedding. My notes from previous years remind me of a few simple and, possibly, general combinations: Artus, bright scarlet, associated with double arabis; Yellow Prince with the purple aubrietias; the double-flowered Murillo intermixed with Myosotis alpestris Victoria; and Couleur Cardinal—catalogues are rather undecided as to the colour of this, but the effect is very fine interplanted with Erysimum Golden Gem; as is the variety Cottage Maid—rosy pink, etc.—flowering over an underplanting of Alyssum saxatile compactum.

This association of tulips with a groundwork of various other plants tends to prolong the flowering period and produce interesting contrasts. The varieties are low in price, and the manner of use economises the number of bulbs required, with results more generally appreciated than if the beds were planted with tulips alone.

Doune, Perthshire. WM. MCCARRELL.

FRUIT UNDER GLASS.

The Vineries.—Where the vines are cleared of their crop, everything should be done to discourage lateral growth and thoroughly to ripen the wood. It is necessary for the wood to mature and for the rods to have a long season of rest. Admit full air both from the front and top ventilators, and with normal weather no fire heat will be needed, but should it prove dull and cold for any length of time, a little warmth from the hot-water pipes will greatly assist in the ripening process. No damping down is needed, but the roots must still be kept moist, and a mulch of manure will not only reduce the labour in watering, but it will prevent the soil from cracking, and benefit the roots. Keep the foliage clean by spraying with clear water occasionally, and if red spider appears it will be advisable to use an insecticide late in the evening. In vineries where the main leaves have become damaged through scalding, attacks of red spider or other causes, it will be an advantage to allow a moderate extension of the lateral shoots. With this outlet for the sap, the dormant buds quietly develop without starting into growth. Where the main or lower leaves are in perfect health, there is not much need for lateral growths, and these should be pinched frequently. Never allow them to extend so that it becomes necessary to cut a large quantity at one time. T. [illegible]

The Cultivation of Tobacco—No. 1.

Planting Out

The seed is sown in February and March in beds or frames, the soil of which has been subjected to great heat to kill any weeds or insects.

These beds are protected from the frost, and in six or eight weeks' time the young plants are about six inches high and are ready to be transferred to the tobacco fields. Without this special preparation it would be impossible to produce the Rich, Ripe, Virginia Leaf used in the making of

ADCO

In a few months you will have a plentiful supply of rich organic fertiliser.
1 cwt. ADCO makes from 2-3 tons of MANURE according to the class of rubbish used.

ADCO ACCELERATOR
(for lawn mowings and soft green refuse
28 lb., 4/6 ... 56 lb., 8/- ... 1 cwt., 15/-

STANDARD ADCO
(for all other garden rubbish and straw
28 lb., 6/- ... 56 lb., 11/6 ... 1 cwt., 20/-
Carriage paid on orders for 1 cwt. or more. Cash with order.
Stocked by all leading Seedsmen, Harrods Ltd., etc.

ADCO LTD. 40 HARPENDEN HERTS.

Banish White Fly

Snow Fly on Tomatoes and Cucumbers can easily and safely be eradicated by means of Abol White Fly Compound. No apparatus is needed. Simply pour the Compound down the centre path of the House at the rate of 2½ fluid ozs. to 1,000 cubic feet of space.

Sold in round tins as under. When reckoning quantity required allow ½ pint for each 2,000 cubic feet.

Size.	Price.	Postage.
½ pint ..	1/- ..	6d.
¼ pint ..	1/9 ..	6d.
Pint ..	3/- ..	9d.
Quart ..	5/- ..	9d.
½ gallon ..	8/- ..	1/3
Gallon ..	15/- ..	2/6

Of all Nurserymen, Seedsmen, Florists, Ironmongers, Chemists and Stores.

Abol, Limited,
9, Beltring, Paddock Wood, Kent.

Abol White Fly Compound

Notes from Maidstone.

OUR CATALOGUES.

WE have now distributed our Rose, Bulb, and Supplement to the Fruit Catalogue to our customers. Our Illustrated Fruit Tree Catalogue is now ready and contains many new features. The best pollinators for each variety of fruit are stated, where known, and a special table is given of varieties which pollinate each other mutually. Other features of this catalogue will be referred to in subsequent advertisements.

THE GARDEN

VOL. XC.—No 2854. AUGUST 14, 1926

Price Threepence. Yearly Subscription, Inland, 17s. 4d.; Foreign, 17s. 4d. Registered at the General Post Office as a Newspaper and for Canadian Magazine Post.
Editorial Offices: 20, TAVISTOCK STREET, COVENT GARDEN, W.C.2. *Offices for Advertisements:* 6–11, SOUTHAMPTON STREET, STRAND, W.C.2.
Entered as Second-class Matter at the New York, N.Y., Post Office.

THE GREATEST PROVINCIAL SHOW

FEW flower shows can have made such an instantaneous success as that at Southport. That which will be held on August 25th, 26th and 27th will only be the third annual show, and yet the Southport Corporation has planned these shows with such skill and such vigour that the Southport Flower Show can now be regarded as second only to Chelsea, and a very good second, as those who visited it last year must realise. The exhibits this year should exceed even those of last year, for several special features are arranged, including a special Jubilee Show of the National Rose Society and a collection of grapes from the largest vine in the world, at Kippen, Stirlingshire, that last year had 2,163 bunches. It is a Gros Colmar.

FOLLOWING Colonel Cuthbert James's letter suggesting the formation of societies for the preservation and re-establishment of our rarer native plants, a correspondent has sent in a more detailed scheme as follows:

"*Where?*

"In counties. Each county to specialise as far as possible in the plants native to that county.

"*By whom?*

"A voluntary organisation of landowners, farmers, gardeners and amateurs.

"*Procedure.*

"(1) Members of the organisation would protect as far as was in their power all rare native plants growing wild.

"(2) They would grow from seed if possible, or from slips, or rootlets (in the case of rare plants the organisation would have to be responsible for the first supply) such plants as were, or had been, native to the district the members live in.

"(3) Progress to be reported to headquarters once a year, in October.

"(4) Young collectors should be encouraged to view the plants growing wild; then, instead of rooting them up, apply to the organisation for specimens to add to their collections. This would arouse their interest and lead them to take a hand in increasing instead of diminishing their county's native plants.

"(5) In two or three year's time when some progress had been made and interest established, the question of joining forces and having a national out-door museum might be considered. — (Mrs.) S. ROBSON, *West Hartlepool.*"

A FRUITING SPRAY OF PYRUS VILMORINII.

THIS week's plant is Pyrus Vilmorinii, one of the best all-round shrubs that has come out of China. It does not grow to a great size and is noted for the elegant grace of its arching branches. As will be seen from the accompanying illustration, the foliage is neat and fernlike, so much separated are the leaflets. In spring when the young shoots first appear they are a most delicate dull red. The flowers are nothing out of the common but the fruit makes up for any lack of flower distinction, for it begins by turning a good light red and the colour slowly fades through pink to a creamy white with a faint blush remaining. This most excellent mountain ash is quite hardy and is perfectly happy in any medium loam. It succeeds best in nearly full sun and should have an annual mulching. It is so good that many who know it will place it among the dozen best all-round shrubs in the garden.

A SELECTION OF MAPLES

THE acers are widely distributed, being found in all the principal countries of the world, excepting South America and Australasia. Practically all are very hardy trees and shrubs, and all are deciduous. There are, however, two varieties which sometimes lead one to believe one has found an evergreen acer. The first is A. creticum, the Cretan maple, which in some cases holds its foliage through the winter; in fact, there is great diversity of character in a batch of seedlings, some always appearing to be evergreen varieties. The other is A. lævigatum, sometimes described as evergreen, but I have yet to find a truly evergreen form, as sooner or later it loses its foliage. Acers generally may be divided into three widely scattered groups—Eastern (Japanese and Chinese), Western (American) and European. All three groups furnish us with some varieties of remarkable beauty, but undoubtedly the palm must go to the eastern group, which gives us A. palmatum, the forerunner of all the most beautiful and elegantly foliaged acers. Their colours alone are sufficient to endear them to all garden lovers, embracing as they do every colour known in foliage, including shades of green which I can only call unique. A. palmatum and its varieties enjoy a little peat or leaf-mould added to ordinary soil, and will not do quite so well in soils containing lime as will the members of other groups. When speaking of hardiness in acers, it must be remembered that on account of the beautiful, but very tender, foliage, A. palmatum must have a certain amount of shelter from cutting winds and, sometimes, spring frosts, as these are liable to injure the foliage. One of the most remarkable varieties of A. palmatum is A. p. atropurpureum. This has very dark purple red foliage of palmate form, is a good grower and retains its wonderful colour till the foliage falls. There is also a beautiful golden form of palmatum. A. p. roseo-marginatum has a delightfully green leaf which is heavily bordered with brilliant rose, giving the tree a most pleasing and handsome effect. A. p. dissectum has very finely cut fern-like foliage of a bright green colour. There is a beautifully variegated form called A. p. dissectum variegatum having its foliage plentifully marked with rosy pink and tints of creamy white or palest primrose. A. p. septemlobum sanguineum is a brilliant-coloured variety, and remains good throughout the season.

The Western, or American, group gives us A. Negundo, the box elder. Of this beautiful species Kew mentions no fewer than ten varieties, including the type. In many gardens the graceful A. Negundo variegatum is to be seen, but there are more beautiful varieties to be had. One of the most brilliant here is A. N. foliis marginatis aureis, the variegation being of a most telling golden colour, giving the tree a rich golden hue. A. N. californicum aureum has foliage entirely golden and of a larger size than some others. A. N. laciniatum has foliage finely cut and is a splendid grower, and soon makes a fair-sized tree. A. rubrum also makes a fine tree and, as its name implies, has good foliage. Its variety A. r. Drummondii is indeed a beautiful sight, its foliage being heavily margined with a pale primrose colour. A. pennsylvanicum, in addition to its beautiful foliage, has its bark striated with whitish streaks extending longitudinally along its trunk, hence its common name of snake-bark maple.

A GRACEFUL TREE OF ACER PALMATUM.

Among the European group—which includes the Norway maple with its many lovely and stately trees, the sycamore and the common English maple, A. campestre—are to be found most of the largest tree forms of the acers. Many make fine specimen trees for park planting. They are also extremely useful for woodland plantings. A large wood composed entirely of the European acers would, indeed, present a beautiful and brightly coloured picture in spring and summer. What its autumn effect would be I can only imagine, its tints of scarlet, gold, amber, crimson, etc., being beyond the limits of my pen to describe. Of the common maple, A. campestre, there are one or two extra good varieties. One which makes a pretty standard for the lawn is A. c. pendulum foliis variegatus. It is not a rank grower, therefore it is well suited to limited space. Of the Norway maple one could go on writing

Digitized by Google

for whole days, there are so many truly remarkable varieties. All are good growers, quite hardy and not at all particular as to soil conditions. The type name is A. platanoides. A. p. Schwedleri starts off in spring with rich dark red foliage, which later becomes a deep reddish green. A. p. Reitenbachii has beautiful large green foliage and makes a good tree. In autumn the foliage turns a deep bronzy red. Other good varieties of A. platanoides are laciniatum (the eagle's claw maple), heterophyllum variegatum, maculatum and palmatum.

A. Pseudo-platanus, or the sycamore, has many lovely things to offer. As I can only mention a very few, it becomes difficult to choose. Anyway, A. Pseudo-platanus Leopoldii is one I must include. Easily obtainable and a certain doer, it has large foliage heavily variegated with creamy white and primrose. Moreover, it retains its freshness till autumn. Another fine variety is A. Pseudo-platanus Prinz Handjery. This I consider to be one of the most beautiful acers we have. It has large, typical foliage variegated with silver and deeply tinged with bronze. A. Pseudo-platanus brilliantissimum has lovely pinky foliage in spring. A. Pseudo-platanus Worlei is a beautiful golden sycamore. This is often wrongly called the Corstorphine plane, A. Pseudo-platanus flavo-marginatum being the rightful owner thereof. The best purple sycamore is A. Pseudo-platanus atropurpureum. There is also a purple variegated form.

Paignton. JOHN HILL.

BABIANAS AT HOME

A GLEAMING, glowing spring morning in the Western Province of the Cape; the car skims along over the eight miles of road which take us a thousand feet down, almost to sea-level, through the little dorp which lies at the foot of the mountains and out on to the flats which stretch to Cape Town and the sea.

The road is bordered with mimosa and wattle in full glory of golden bloom, arctotis and gazanias border the roadside in every shade of orange, yellow and white.

Suddenly one gives a gasp and a long drawn "Oh! how beautiful!" In front of us a carpet of deep blue and cream. At first it gives one the impression of primroses and bluebells as one comes across them sometimes in England in a clearing of the woods; then one realises the difference. This is a real, deep, intense blue, without a suggestion of lilac or lavender. Babianas, of course, perhaps half an acre of them, the intensity of their blue just relieved by the cream sparaxis scattered among them. This was two years ago, and now there is a terrace bed in my garden vivid with this same deep dark blue below the orange spikes of Aloe plicata.

It is not necessary to remove many corms, for the babianas seed freely and germinate easily, flowering the second year. The flower has something of the appearance of a crocus on a larger scale, bearing many flowers on branched spikes a foot long or more.

THE SOFT CREAMY PETALS OF B MACRANTHA.

This blue babiana—B. stricta—runs through many varieties, of which the rubro-cyanea mentioned in THE GARDEN for July 11th, 1925, is one. It is also found with pale yellow blooms and is probably better known as Gladiolus sulphureus.

BABIANA RUBRO-CYANEA HAS LILAC FLOWERS WITH A RED THROAT.

B. stricta flourishes on hard, dry ground, but always on stiff soils, where drought affects it little, for its corms are often a foot down and sometimes deeper. It blooms before the really dry weather sets in, and having done this and having set its seeds and stored up supplies, it is impervious to blazing sun and drying winds, and is, indeed, hard to find until, the winter rains being over, its plantain-like leaves push through and soon the wonderful blue blooms are with us again.

Babianas are many and varied. There is B. plicata, which flowers earlier in the spring than stricta. Its blooms run through every shade of mauve and lavender, each one differently marked with crimson or maroon on the lower segments of the corolla, the scent makes it specially attractive, reminding us of freshly picked cowslips. It blooms in masses on sandy soils, which are wet in the winter and its two companions, the golden star hypoxis and the apricot butterfly morea, suit it to perfection.

There is also the deep red B. villosa, which is only found in a few favoured localities; once seen growing among the wonderful patches of purple sparaxis it is not easily forgotten.

Digitized by Google

And again, the lighter scarlet B. ringens, found here and there, is interesting in that it carries a barren branch to its flower spike. This is particularly adapted to form a perching place for the sun bird which fertilises its flowers. Babiana macrantha with its creamy flowers grows very tall in swampy places.

All these should be capable of cultivation in England. Grown in a cool greenhouse and planted out on a warm border at the end of May, they would make a grand show when the spring-flowering bulbs are over, and in warm localities they should stand the winter outside, particularly if a little protection be given. A warm corner in a rock garden would suit them to perfection.

In their own haunts they know not more than one degree of frost, but deluges of rain all the winter and hot baking sun all the summer.

The name babiana comes from the Dutch word for a baboon, as these animals are supposed to be fond of the corms and to dig them up. They would certainly have to work hard for a meal of them. K. C. STANFORD.

THE TULIP MANIA

This is the first of a short series of articles on bulbs which was prepared by the late Rev. J. Jacob for THE GARDEN *a short time before his death.*

TO understand how the famous "Tulip mania" rose, it is necessary first of all to try to picture the rather dull tone of a sixteenth century garden previous to the advent of this gay stranger from the East. The fame of the new flowers in the garden of Carolus Clusius at Leyden rapidly spread and created in the Hollanders of his day a desire to possess some of them for themselves, and it is no more strange than the passion of our parents for the gaudy carpet bedding of the sixties and the seventies of last century, when history repeated itself in good old favourites being thrown away or pushed aside, to make room for the fashionable geraniums and calceolarias with which that time will for ever be associated. As it was then in Britain, so it was two hundred and fifty years before in Holland. The rage for tulips rapidly spread as the flower rose in popular estimation. Even people of moderate means, such as small shopkeepers and weavers eagerly sought for the best varieties, and, in consequence, the prices, which, if we may believe the tale of the theft of bulbs from Clusius's garden to be true, were never very low at this time, became higher and higher, so much so that a trader at Haarlem is said to have given the half of his fortune for a single root, not with the design of selling it again at a profit, but to ornament his garden. This would be situated where the Kleine Hontweg now is, as this road runs through the part of the town where these tulips were formerly cultivated.

Here were the gardens of some of those foolish people whom Petrus Hondius wrote about in his "Dapes Inemptæ," published in 1621 at Leyden, as giving up every other floral adornment for the sake of "one, three or four weeks" of tulips, which are liable, as he said, to be spoilt even in this short time by heat or rain. This contemporary reference to tulip growing proves that up to this time the flower was cultivated for the pleasure it gave, although our author is very careful to observe that much as he loved the tulip himself, he certainly thought these people who gave up all else for it were overdoing the thing. We can well imagine then that when a demand came from rich men in France, who were as anxious to possess them as the Dutch were themselves, that prices stiffened. There is no reason to doubt the testimony of another contemporary writer, one Nicolas Wassenaer, that the owner of two bulbs of the famous red and white "Semper Augustus," refused in 1625 an offer of three thousand florins for them. It may be that the last straw which turned legitimate trading into a pure and simple gamble was the long continuance of a fashion in Paris for the higher class young ladies of the period to wear flowers in their dresses of an evening. Naturally, every young man wished to present the lady he admired with the choicest offering he could buy. Tulips were the fashionable flower. He must have them. The supply at home was soon exhausted, so off he sent to Holland. As this was repeated for several years and as high figures were always obtained, the growers in Haarlem and other Dutch towns began to think that they would not have too many and prices steadily rose higher and higher, culminating in such extravagant figures as 4,400 florins for an Admiral Liefken, 1,620 for an Admiral van der Eyck, 5,500 for a Semper Augustus, 3,000 for a Viceroy, and in certain cases, when the buyer could not raise enough cash, goods of various descriptions were substituted, thus one bulb of Viceroy changed hands for the following: 2 lasts of wheat, 448 florins; 4 lasts of rye, 558 florins; 4 fat oxen, 480 florins; 8 fat swine, 240 florins; 12 fat sheep, 120 florins; 2 hogsheads of wine, 70 florins; 4 tuns of beer, 32 florins; 2 tuns of butter, 192 florins; 1,000 pounds of cheese, 120 florins; a complete bed, 100 florins; a suit of clothes, 80 florins; a silver beaker, 60 florins; total, 2,500 florins.

We have a very good idea of what these flowers were like; for not only have we excellent illustrated books of the period when tulips were fast rising in value in the beautiful "Hortus Floridus" of Crispen de Passe, *c.* 1614–15, and in the "Livre des Fleurs" of Langlois, where accurate pictures are given of some of the best, but there are also coloured sketches of some of the most celebrated blooms of the mania period itself, 1634–37, in Mr. Ernst H. Krelage's library at Haarlem. Three of these, Viceroy, Semper Augustus and Gouda are reproduced in colour in Solms-Lauback's "Weizon und Tulpe." In every case it will be observed they are striped and I am disposed to think that they were most of them either some shade of red and white, or some shade of purple and white.

The year 1634 is usually reckoned as the beginning of the mania proper, although long before this time high prices had been given for choice varieties. The first development seems to have been the selling of the bulbs by weight. This had the advantage of allowing the small offsets to be sold at corresponding prices to the larger ones and to the mother bulb. Before planting, these would be carefully weighed and this weight became the basis of the calculation between buyer and seller in fixing the price when lifted. In the course of time when all pretence of dealing in actual bulbs had been abandoned, when no one either knew or cared what a variety was like, when it was really nothing but a name and when the very last thing that was thought of was either the delivery or the receiving of the bulbs, it became the custom to sell so much of a kind irrespective of whether that weight corresponded to a whole bulb or not. For this purpose a weight called an azen (less than a grain) was used and all later transactions took place on this basis. Thus, not long before the crash came, we have the record of 440 azen of Admiral van der Eyck being sold for 1,620 florins. Again (retracing one's steps), owing to the extraordinary furore which the inflated trade soon caused and the way in which the numbers of those taking part in the gamble rapidly grew, special provisions for selling were instituted. Little capital was at first required for a start, only a small garden and the purchase of a few self-coloured or possibly some striped bulbs, and as these could be secured by the sale of a person's ordinary business or tools, or by a mortgage on their houses, it was possible for all classes to join in, as they undoubtedly did. Soon there arose what are known as Collegiums or Clubs, which virtually corresponded with our modern stock exchanges and where business came to be transacted under certain well defined laws and regulations.

The inevitable crash came at the end of February, 1637. Such mad dealing in bulbs, which cannot have been intrinsically worth but a fraction of their inflated values, could not go on for ever. One thing is certain, the more level-headed and wiser began "to smell a rat," and in their later transactions made what provision they could for the proverbial "rainy day." The possibility of a fall was provided for. Munting cites the case of his own father. "My father had also in 1636 sold a few bulbs to a man from Alkmaar for the sum of 7,000 florins on the condition that the bargain was to stand fast if no fall occurred within six months, but that if this happened within that time the buyer should give 10 per cent. of the price agreed upon." The author records that a fall occurred

Digitized by Google

and to his sorrow the elder Munting only received 700 florins and had to keep his bulbs which he would much rather have handed over.

The dreaded day, February 3rd, 1637, came suddenly once there was a loss of confidence. No one would buy and no one could sell. The florists of the chief towns concerned, Haarlem, Delft, Gouda, Utrecht, Alkmaar, Leyden, Enkhuizen, Rotterdam, Hoorn and Amsterdam, met on February 25th and tried to patch up matters, but not very successfully. In the end the States-General had to intervene and in conjunction with the burgomasters and magistrates they took what measures were possible for the winding up of this disastrous business. Their last decree was dated May 22nd, 1638, so long a time did this process take, before all was settled and trade became normal again.

EDGING PLANTS

THERE is a certain completeness about a garden of which the beds and borders are fringed with flowering plants in their respective seasons, and, incidentally, there is something lacking where edgings are not to be seen. In former years, when the bedding-out system held sway, a deal of trouble and, in some instances, not a little expense were incurred to make the garden bright for a few months, and edgings were one of the chief features. Plants are still used for this purpose of an annual character, but not to the same extent, and I think the reason is because it is being realised more every year that one may employ those of a more enduring nature that will give just as much, if not more, pleasure, without so much labour. It is a far cry to the time when it was regarded as fashionable to have not merely a single row of some tender subject, but a double row of edging plants; and it will, no doubt, be within the recollection of many readers that blue lobelia, dwarf and prim, like the old Crystal Palace compacta, was planted in conjunction with the even more formal Echeveria, the flowers of which were often pinched off. Happily, I think, we live in a day when hardy plants are becoming more recognised every year, and for their usefulness as edgings we may claim some of them. Where garden paths are edged with rough pieces of stone, opportunity offers for planting among them close-growing things like mossy saxifrages, such as SS. muscoides, cæspitosa or hypnoides. Sedums also afford suitable plants to wander about a stone-edged walk, as SS. album and lydium. Who does not know the country flower border where, along the verges, cushions of pink and white thrift are to be seen in spring and summer; and equally familiar are pinks whose foliage is compact, and in their season of flowering bring such fragrance to a garden. Mrs. Sinkins is still one of the sweetest whites! Senecio argenteus is noted for its silvery foliage growing only 2ins. or 3ins. high. It is hardy if planted in a well drained border, and is a capital plant for a permanent edging. A little border in my garden has been a mass of blue and white bells from the fact that along the side of the path some tiny pieces of Campanula pusilla and its white form were planted a year or two ago; but there are others more showy, like G. F. Wilson, with deep blue blossoms; in fact, we have in campanulas quite a number capable of making a brave show year by year.

Spring beauty among edging plants ought not to be lost sight of. Aubrietias offer a selection, and when once established it is mainly a question of keeping them within bounds.

Raised beds are sometimes difficult to deal with in the matter of edgings. One known to me, planted with the dwarf Iberis correæfolia, has covered most of the stones, and for some weeks this summer was full of its white flowers.

It is not the difficulty of finding sufficient hardy subjects for edging purposes that confronts one about to plant, as there are so many, but in choosing one or two that will best suit one's purpose. W. LINDERS LEA.

HARDY PINKS BORDERING A PATHWAY.

SERVICE FOR READERS

Though so many subjects are dealt with in each issue of THE GARDEN, it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, whether advice is sought as to—

RESTOCKING A GARDEN, COLOUR SCHEMES FOR GARDENS, THE BEST PLANTS FOR CERTAIN SITUATIONS, WHERE TO OBTAIN NEW AND RARE PLANTS, INSECT PESTS, NAMING OF PLANTS, AND THE HUNDRED AND ONE OTHER DETAILS RELATING TO THE GARDEN—

there is always information available from a staff of expert contributors and consultants; *and there is no charge for this.* It is one of the additional means of service which THE GARDEN is glad to render to its readers.

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope shall be sent with the enquiry.

All communications should be addressed to the Service Department, THE GARDEN, 20, Tavistock Street, Covent Garden, London, W.C.2.

NOTES OF THE WEEK

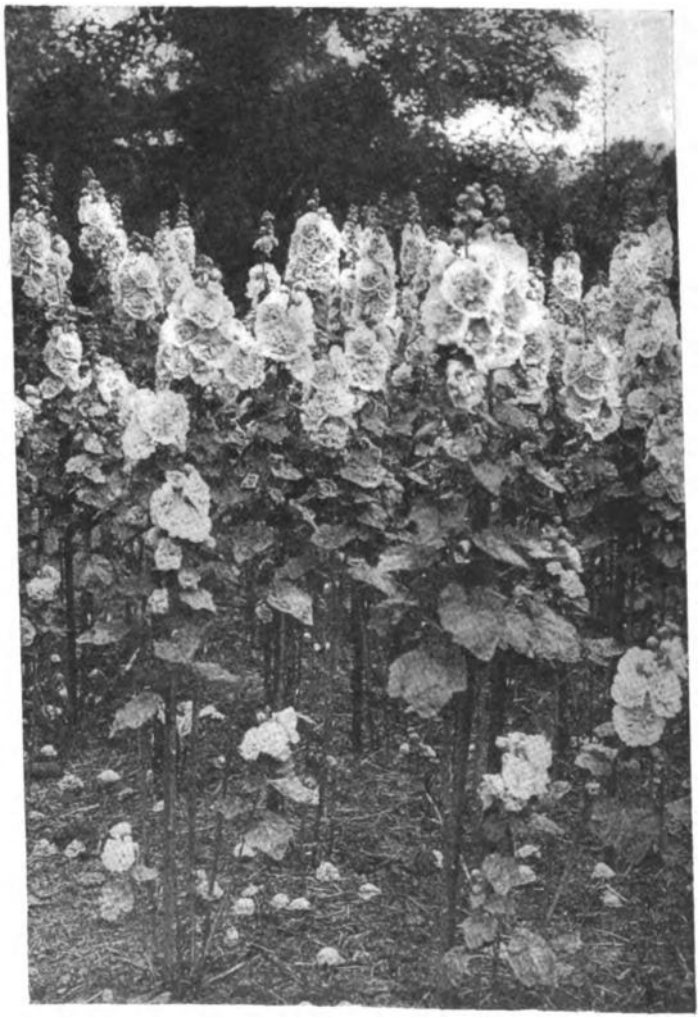
EVODIA HUPEHENSIS.

AMONG the collection of ornamental trees at Kew there is one that proved its worth last year for the first time. This is Evodia hupehensis, whose berries were a magnificent sight for over three weeks. It was first discovered by Professor Augustine Henry (4482) in 1887, and was introduced by Wilson during the Veitch expedition of 1901. This genus is a typical member of the rutaceæ and probably has its nearest relative in the phellodendrons. Wilson states that "it is a very common tree in the woodlands of western Hupeh, where it grows to a larger size than any other species. Like its allies it has smooth grey bark, spreading branches and brittle wood, and is known colloquially as "the stinking ash tree." Why it should be thus named I do not know, for I have noticed no evil odour emanating from several specimens I have seen growing in this country. The tree at Kew, which is probably the largest in Britain, is about 20ft. in height, with a crown about 14ft. in diameter. Four to nine slender leaflets are carried, while the flowers are borne in large panicles and are fairly inconspicuous. So far this tree has been considered uninteresting, but last year it was covered with panicles of tiny berries of a port wine colour. So fruitful was it that it was one of the sights of the garden. It is perfectly hardy, but of rather slow growth. Its fruiting qualities, however, are such that it should be more often grown where autumn colours are appreciated. —R. H.

HOLLYHOCKS.

HOLLYHOCKS were among the most highly prized garden flowers grown by the old florists. As far back as 1724—*vide* Miller's Gardener's Dictionary—we are told that it was a plant of considerable variety, with red, white purple, black and other coloured flowers, and, like some of the other flowers they grew, hollyhocks were distinguished by name; much more, indeed, than they are in our time. Fifty years or more ago the firm of Paul's of Cheshunt and Chater of Saffron Walden were noted for their strains of hollyhocks. In my youth I have a distinct recollection of double-flowering sorts being more thought of than the singles; in fact, I remember that a single would not be countenanced in a garden if it could be avoided, but this was not to be wondered at considering that the same prejudice existed with ten-week stocks. Although the hollyhock may not be so widely cultivated as it deserves, it still remains among the noblest and stateliest of our garden plants, a beautiful object when fully grown and roped with its rosette-like blossoms. Its great height possibly prevents those who have only moderate-sized gardens from growing it, but for long borders and on the foreground of shrubberies it maintains its reputation as one of the most attractive subjects one can possibly take in hand.

Culture.—It is well understood that to have the best results deep and very generous culture must be followed. The great height to which it grows and the rapidity of progress all point to the necessity of deep trenching and a liberal use of manure. The preparation of the soil for hollyhocks is a matter of prime importance, and nothing which may be done for them afterwards can make up for any shortcomings in this respect. To this end a start should be made in the autumn, trenching and manuring the ground, leaving it rough for the winter, and breaking it up in spring, following on by mulching the surface with rotted manure once or twice during the summer. Hollyhocks are lovers of moisture, and during a dry season will need much attention in this direction.



A CLUMP OF OLD-FASHIONED DOUBLE HOLLYHOCKS.

Position.—A sunny position serves them best, although they are not averse to a partially shaded one provided there are no overhanging trees.

Propagation.—Three methods of propagation are open to the cultivator, *viz.*, seed, cuttings, division of roots. The first named is the one most generally practised to-day. Virtually it is treating the hollyhock as a biennial, and it is by following this plan that the disease to which they seem still liable—a rust fungus known as Puccinia malvacearum—is kept under control more than when plants are allowed to occupy the same position for a season or two. Grown as individual plants and given stout, long stakes, hollyhocks form one of the attractions of the garden.—CLAREMONT.

LILIUM MARTAGON CATTANEÆ.

THERE came into flower with me in the first week of July the handsome lily known as L. Martagon Cattaneæ, which is rather lighter in colour than the variety L. M. dalmaticum. Both are exceedingly fine, and L. M. Cattaneæ, with its almost mahogany brown flowers, is quite striking in the border. Mr. A. Grove appears to agree with the late Mr. Elwes in considering that L. M. dalmaticum is entitled to specific rank, and, if so, Cattaneæ may be taken as a variety of dalmaticum. Both have the distinguishing feature of the buds being covered with masses of white hairs. L. M. dalmaticum and L. M. Cattaneæ are sometimes said to grow as much as 8ft. high, but I have never had them so tall. At the same time, in this garden, where L. Martagon and its beautiful white variety are comparatively dwarf, Cattaneæ is quite twice the height of either of these. I am growing it in full sun and in ordinary garden loam, not too rich. It is a lime-loving lily, and is often found growing in shade as well as in sun. It should be planted 4ins. deep.—S. A.

ARCTOSTAPHYLOS UVA-URSI (RED BEARBERRY).

THIS trailing shrub is splendid for a dry, sunny place on the rockery. Attractive in every way, with its small bright evergreen leaves and pinkish white flowers, it is at its best in the autumn, when the foliage turns to bronze and scarlet with its crop of red berries. It is most difficult to transplant, having only one single main root, and should be propagated from seed sown in sand with a little peat in the spring. In Canada, where it grows, bears are very fond of its fruit, and I believe the Indians call it "Kinnikenie," and appreciate it for its medicinal value. Where happily placed the arctostaphylos will cover patches several feet in diameter. A. alpina and A. tomentosa are also very attractive. The former is a very small species, which we have, unfortunately, failed with.—R. MOORE, *Thorpe Hall.*

ASTER FARRERI.

I HEAR a good number of complaints about the shy flowering of Aster Farreri, and my correspondents appear to agree that it does not bloom well in a rich, rather moist soil. In conversation with a friend who sees many gardens from time to time, he informed me that in another garden in somewhat similar soil to mine he had seen it flowering well, but that in others it was a disappointment in this respect. With me it has flowered fairly well, and has increased at the roots. It is in a dry border near a stone edging, and it has shown a tendency to creep along the stones. After growing it for some time, one has to admit that it has fallen in one's estimation very greatly, and now that we have so many good perennial starworts it will take Aster Farreri all its time to retain its favour. Some forms appear better than others, but, on the whole, it does not continue to receive the favour it did when first introduced.—S. ARNOTT.

LILIUMS.

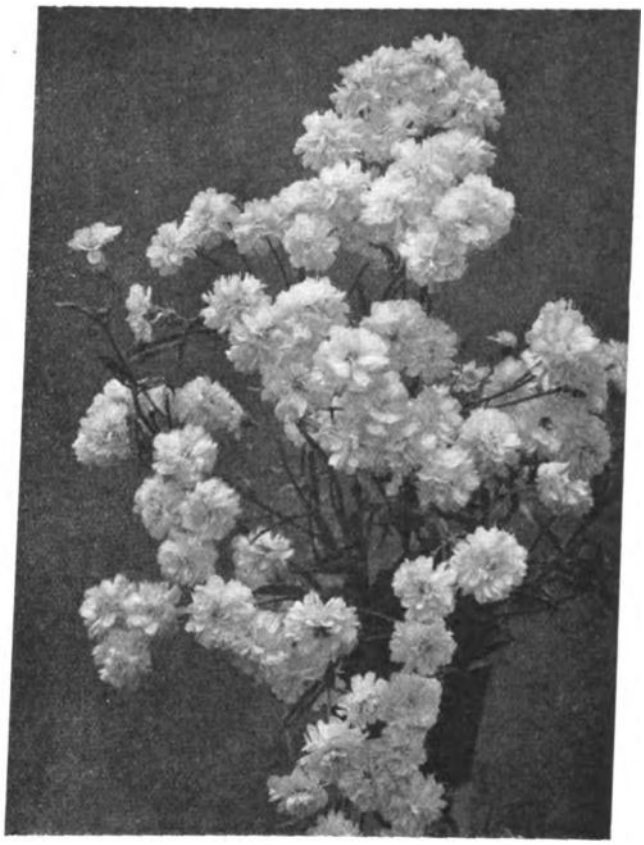
The Fallacy of Cutting Stems Prematurely.

COMPLAINTS are sometimes made as to the non-flowering of garden lilies, notably L.L. chalcedonicum, giganteum, testaceum and candidum. In some instances I think this is due not a little to the stems being cut down the previous season while green and full of sap, instead of letting them wither naturally. There is nothing gained whatever in being in too great a hurry to dispose of flowering stems of lilies; and those whose idea is to keep the borders tidy should, I think, draw the line at these stately denizens of the garden. The one who makes tulips a speciality, or takes a pride in choice narcissi, would never dream of cutting away foliage until it had died down, as to do so cannot be beneficial for the bulbs. On more than one occasion I have seen a group of the old L. candidum quite bare of flowers, due to nothing else than the ruthless depletion of leaves and stems that had not fulfilled their mission, while other clumps in the same garden, left alone, bloomed as usual the next season. In so far as L. candidum is concerned, it is generally agreed that the best time to plant the bulbs is immediately the old flowering stalks have died down, and before new growth appears; and one wonders sometimes whether in the case of non-flowering of imported bulbs the following year, this is not due to the premature cutting away of foliage for the purpose of packing and despatching the bulbs so as to reach the markets early. I think that this may not be after all, a far-fetched idea.—W. LINDERS LEA.

ACHILLEAS.

Useful Plants for Borders.

IN the achilleas, we have a group of very hardy herbaceous plants that are of service in the borders, blooming profusely for many weeks in summer, free of growth, and increasing so rapidly that it becomes imperative, having regard to other occupants, to divide them every two years or so. It is unwise to defer division as it leads to confusion, the roots ramifying so much. As is known, the plants are recognised as milfoils-yarrows, and seen in a mixed border of hardy plants when in bloom, are very attractive. Besides the border species, there are others of a dwarf nature, fitted for edgings or for positions in the rock garden. Taken as a family, they vary in height from 3ins. to 4ins. to about 4ft., and, except in very shady places, will grow in most gardens. They need only ordinary soil. Rich and manured soil only tends to abnormal root growth and that is one thing to be guarded against. One has only to leave a root or two alone in a border for a few years to find out how quickly they run near the surface and almost strangle other plants within their vicinity. Planting may be done in autumn or spring. If planted in autumn, the probability is that the roots will be sufficiently established by the next season, that flowers will follow as a matter of course. Seldom does the frost hurt achilleas. Propagation may be effected from seed sown in spring; from cuttings also in spring, and as mentioned, by dividing the roots. White sorts appear to be very popular still, and it will be remembered that for quite a number of years no one disputed the claims of Achillea Ptarmica The Pearl, for premier position. It is known by its small, white button-like flowers, so plentifully produced, but when Perry's White made its advent, it was, by common consent of those who had grown it, given the first place as the best white achillea. Its flowers are larger, being nearly double the size of The Pearl, and of the purest white. Flowers of all of them are useful for cutting, and last some days in water. Like most other composites, a dry season militates against achilleas and in order to lessen the labour of carrying water, it is advisable to spread about the roots a temporary mulch. If this is not done watering is likely to become burdensome. In a mixed border of hardy flowering plants of any size, one invariably notices achilleas and among them there is almost certain to be a clump of A. eupatorium, with its bright yellow heads, and Cerise Queen, a bright red. These are generally disposed on the middle or back rows of the borders. Other noteworthy members of the family are Mongolica, syn. sibirica (white), Kelwayi (rosy crimson). Most of the achilleas bloom over a long period, but it is advisable as soon as the flowers are over, to cut away the stems. They are among the useful plants in a garden that one would not like to part with and so long as they are kept within proper limits, they serve us well.—W. L.



ACHILLEA PERRY'S WHITE, THE BEST WHITE VARIETY.

A FINE PATCH OF MESEMBRYANTHEMUM CRASSULINUM.

MESEMBRYANTHEMUM CRASSULINUM.

THE mesembryanthemum cannot be grown in every garden, and there are few spots away from the sea where they can be kept permanently in the open ground. However, they are a charming race, although somewhat mixed up in regard to nomenclature, and it is with some diffidence that one refers to the plant illustrated as M. crassulinum. As such it is quoted in catalogues, and whatever the name according to the latest classification of the genus, it is a charming subject for a hot dry part of the rock garden. In such a position it thrives at Castleford, Chepstow, and although it will remain alive throughout several mild winters, it must be regarded as not quite hardy, and, in consequence, provision should be made to keep a stock in a cold frame to replace losses, if any, outside. It forms a close, dwarf, fleshy growth, with masses of white flowers in June and July, and it is readily increased by division. For hot, dry positions in full sunshine the mesembryanthemums are recommended, and they thrive in any poor stony soil.—T. W. BRISCOE.

CORRESPONDENCE

THE TREATMENT OF PRIMULAS.

SIR,—As the result of this season's observations, I have arrived at the following conclusions as to the best treatment to give primulas. They may not be new, and may only apply to the climate and conditions we have to contend with.

(*a*) They should, if possible, be grown from seed, a fresh lot being planted yearly. In order to get vigorous seedlings, a considerable number of plants should be grown together. Where you only have one plant, try what can be done by hand pollination to get some seed, and sow that.

(*b*) The planting of primulæ should be done between the third week in August and the middle of September. Should time and space not be available then, every effort should be made to have them planted by the end of September. If planting is carried out at this time, the plants have time to establish themselves before the resting period commences and the cold weather sets in. Spring planting (except of plants in pots) should be avoided, as the plants, being mostly spring or early summer flowering, have no time to establish themselves before the flowering period commences, with the result that the flowers are weakly and the plant, having the double burden, is weak, too, and many of the plants fail to flower. Last winter was a pretty severe one. Seedlings planted out in autumn came through it well, and we were able to sow seed of P. cernua on June 18th. In a winter where there are alternate periods of frost and thaw some plants tend to get thrown out of the ground and need attention. P. chrysopha is a case in point.

(*c*) The soil in which they are planted must be rich, but anything like raw manure should be avoided. No primula likes a starvation diet. Soil from a spent hotbed does well to mix with the ordinary loam. The rose border suits many species, such as the Nivalid Primulas. I believe it was Sir I. Bailey Balfour who first planted a nivalid in the rose border, and the habit is still kept up in Edinburgh for special treasures. If you have a big rose border, you can add to its interest by growing primulas there as well. Most of them will be past before the roses begin to flower, but they must not be trampled on at pruning-time.

(*d*) They are benefited in spring, especially when flowering, by a mulching of leaf-mould. Chips should always be mixed with the soil. Some families, like the auriculæ and its sub-sections, seem to like more stones than soil provided they have a ball of earth for the young roots to work in. Drainage must be good, and all like plenty of water during the growing period.

(*e*) If you fail to get seed, and your plants form crowns, do not neglect to break them up and replant as soon as you can after the middle of August and up to the end of October. It gives a greater interest to think of primulas not only as members of the great clan, but also as members of the various families which make up that clan, as this gives a key to their behaviour. Some families are composed of easy doers while others have to be petted and only put in selected corners where, if they flourish, they are a joy; while of some you will be lucky if you see them flower once, then to die without leaving a seed behind.—WM. LOW, *Balmakewan, Forfarshire.*

THE VALUE OF ANTHURIUMS AS FOLIAGE PLANTS.

SIR,—In the issue of THE GARDEN of July 10th Mr. Schneider brings to notice two species of that grand stove genus anthurium. The species he mentions are grown for the floral display, and now I should like to draw attention to two species which are valued for their foliage. The first one is Anthurium crystallinum, which has lovely velvety green ovate cordate leaves with crystal white veins. This is quite an old species, growing to a height of 1½ft. to 2ft. Owing to the brilliant contrast of the veins against the dark background this anthurium is of great beauty, and always attracts attention and admiration. The second species, A. Pfitzeri, is another noble plant, but whether in commerce or not I do not know. These notes refer to the specimen in the nepenthes house at Kew. Growing in a raised mound of peaty soil, it has ovate lanceolate deep green leaves with deep slightly overlapping lobes at the base. The veins are white,

THE HANDSOME LEAVES OF ANTHURIUM PFITZERI.

but without the crystalline sharpness of A. crystallinum. To give an idea of the size of the plant, I may mention that the largest leaf (when this photograph was taken) measured 48ins. long by 19ins. wide. It is a lovely thing, but, of course, is only a fit occupant for a large stove-house.—N. D. H.

CYPRIPEDIUMS IN THE WILD.

SIR,—Noticing an article on the cypripedium, with illustrations, in a June issue of THE GARDEN, I thought you might be interested in the enclosed photograph of C. spectabile, showing the way they grow here in tamarack swamps.—H. B. LEFROY, *Toronto, Canada.*

CYPRIPEDIUM SPECTABILE GROWING IN A SWAMP NEAR TORONTO, CANADA.

NAMES OF EARLY POTATOES.

SIR,—In regard to Mr. Grant's remarks in THE GARDEN, July 31st, page 436, on the "Names of Early Potatoes," I am afraid he will have some difficulty in establishing his claim that "Victory" is a different potato from Duke of York. Yield is a poor argument when comparing synonymous varieties; climate, soil, manurial treatment, degenerative diseases, etc., have a great influence over yield. What I tried to point out in THE GARDEN, April 10th, was that so many growers duplicate their varieties of potatoes.

Surely the raiser of a potato should be protected: then, I say, the Duke of York name must have priority over the name "Victory." "Victory" is not a different potato from Duke of York. It is Duke of York re-baptised. Sentiment has got nothing to do with the name of the variety. The name given to this splendid first early was Duke of York, and it should be known by that name the world over.

I am not one who would advocate the planting of a potato which has deteriorated if any improved variety could be obtained, but by growing "Victory" one is still growing the same old Duke of York.

There are many "different" stocks of Duke of York potatoes, but the difference is due to virus diseases. We can get good, bad and indifferent stocks all over the country, but when the stock is good we are not at liberty to rename it.

Digitized by Google

Mr. Anderson, Director of the Seed Testing Station, East Craigs, stated last week that "Thirty-two out of a total of ninety-six varieties submitted for testing are old varieties re-named. The practice in sending in old varieties as new is thus not yet dead, despite all the information which has been disseminated regarding the identification of varieties."

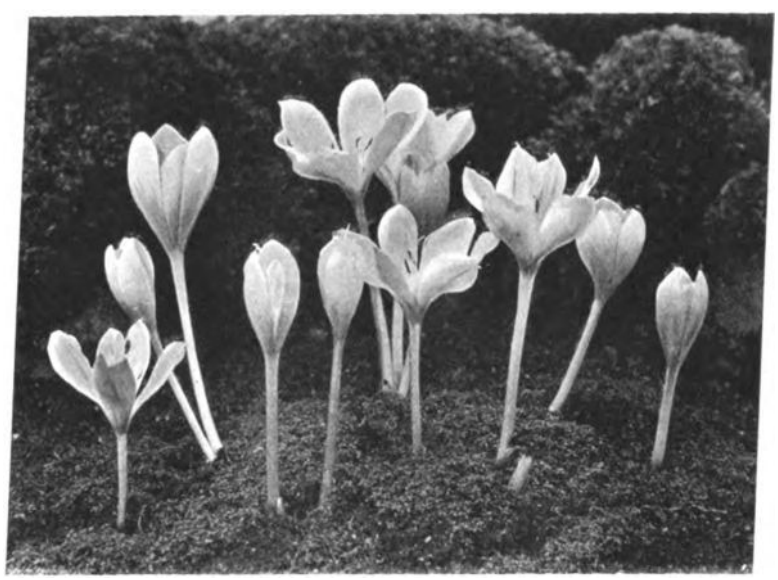
In regard to the Board of Agriculture scheduling all areas under half an acre (not a quarter of an acre), Mr. Grant is under a misapprehension. Growers all over Scotland outwith a scheduled area can grow Duke of York and other non-immune first earlies without even a permit, provided the crop is lifted by the middle of August. Therefore, the greater part of Aberdeenshire, Kincardineshire and other northern counties are not restricted areas, provided the "plotter" complies with the regulations. I, as a "plotter," am not allowed to grow any non-immune variety owing to my plot of ground being within a scheduled area. Still, I do not grumble, there are as good immune varieties as non-immune. I plant Di-Vernon, Early Pink Champion and Snowdrop (Witchhill), and lift in the order named. I commenced using Di-Vernon this year on June 23rd and when those were finished I started on Early Pink Champion and now, August 2nd, I am lifting a beautiful crop of Snowdrop.—GEO. STUART.

THE FLOWER GARDEN AND GREENHOUSE

SPANISH IRISES.

THE iris, such a favourite in all early summer markets, though one of our most attractive and beautiful flowers, is also among the easiest to grow, and the present time is suitable for increasing the stock. The bulbs may be put in flower-pots or boxes filled with any compost of soil and leaf-mould, and then placed in a cool greenhouse to get well rooted before growth commences. In the garden and flower border it is usual to plant the bulbs in clumps of from six to nine, or in rows 2ins. apart, the rows being 9ins. apart. The hole or trench in which the bulbs are placed is best lined with a dash of sand, particularly if the ground is on the heavy side. Three inches is the correct depth to plant the bulbs.

The high prices secured by irises make them a very profitable crop for the small-holder or gardener who includes flowers in his scheme. There is always a strong demand in early summer for the blooms, for nothing at that season can compare in brightness with the glorious yellows, whites and purples of this popular "orchid." They are superb for house decoration, beautiful in the garden and grand in every way. The flowers should not be cut until fully open, and then made up in bunches of a dozen blooms if for sale. After flowering once in pots, the bulbs are quite good for planting out, and can remain in the ground for four or five years, when, if lifted and replanted, they will go on increasing from year to year for many years to come.—R. D.



AN ATTRACTIVE GROUP OF THE TULIP-LIKE FLOWERS OF C. SPECIOSUM.

COLCHICUM SPECIOSUM.

POPULARLY designated meadow saffrons or autumn crocuses, the colchicums, are quite distinct botanically from the crocus, but in general appearance there is a distinct resemblance which justifies the popular name. A wild species, Colchicum autumnale, is found in meadows in certain parts of the country and, in refined forms, in the garden; C. Bornmulleri, often grown, is decidedly better; C. Sibthorpii cilicicum and variegatum are very choice, but best of all the species is C. speciosum, a handsome, very showy type, which will be in bloom when these notes appear. Bulbs, of large size, can be obtained in August and they ought to be planted without any delay; indeed, very often the flower spike is showing when the bulbs are secured. Plant deep enough to give three clear inches of soil above the bulbs.

In spring C. speciosum throws up fleshy, broad leaves; these, during summer, store up a vast amount of energy and die down in July; in August and September the flowers appear alone and, if grown in groups, they make a brilliant spot of colour amid the autumn flowering plants. The flowers are large and bear some resemblance to a tulip; they are decidedly superior in every way to those of autumnale, which are often found in gardens; the colouring is clean and distinct, the flowers more lasting and robust than the anæmic autumnale varieties.

C. speciosum is a variable flower as regards colour, the soil in which it is grown often having an effect and the season, in other cases, altering the tint. The predominant tint is a soft, light purple or mauve, but we have seen them coming up in some years almost white. One variety, rubrum, is of fixed tint, the flowers being a fairly deep ruby red, even the supporting tube, usually white, being in this case a distinct red. A second variety, maximum, retains the soft lilac colour of the parent; the flowers of this are both taller and broader, but we do not find them quite so lasting, especially in wet weather. A double form we grow has very full flowers; this is a fine sort, superior to the common kind and one which lasts well even in bad weather. The last we will mention is a comparatively rare variety, album; this is a gorgeous thing, the flowers being of a beautiful waxy white and, as long as it remains unsullied by rain, the chastest and sweetest toing among all the autumn flowers.—LANARKSHIRE.

MIGNONETTE.

Raising in Pots for Winter Flowering.

MIGNONETTE is always appreciated, whether grown in the open border, in window boxes or in pots in the greenhouse. In general it is a very easily grown plant, but frequently presents some difficulty as a pot subject. In the first place, the cultivator must be careful to examine closely all new loam before it is mixed with other ingredients, as wireworms are enemies of mignonette. The best way is to hand-pick all loam. All manures used should be well rotted and also free from grubs. For the seeds, use fibrous loam reduced to a fine condition, 2 parts; leaf-soil, half-rotted and in a flaky condition, 1 part; a small quantity of old lime rubble will be of more value than sand—even the best. As mignonette does not transplant well, the seeds should be sown in small pots filled with the compost and watered. Drop half a dozen seeds near the centre, cover them lightly with dry soil, and place the pots in a cold frame where they can be watched closely daily. Thin out all but three resultant seedlings if bush plants are required, and all except one if standards are to be grown. In due course, re-pot these seedlings without disturbing the soil around their roots. A shelf in a frame or one in a greenhouse will do very well until Christmas, then a front stage in a greenhouse is best. If the bushes are to be branching, stop the plants; if large spikes are preferred, do not stop. If standard, continue to pinch out side shoots; train the centre stem to a neat stake and remove flowers for a time until the stem is the required height.—CHRISTCHURCH.

LILY OF THE VALLEY: SELECTING CROWNS FOR FORCING.

THE delicious fragrance of lilies of the valley is such as to make them general favourites wherever grown. We value them in the garden when the flowers appear in the first flush of summer, but they are even more welcome in the early days of the year, lured into beauty and sweetness in the warmth of the greenhouse. Time was when the gardener, having in view a spring display under glass, made his preparations by procuring crowns that were grown by Continental dealers for the English markets. That was in the day when Berlin crowns were much in evidence and little attention was paid to the culture of home-grown ones. To a great extent that is now changed and one can buy crowns grown in English soil that are equal to any from abroad. There is a temptation on the part of those potting up crowns for the first time, to repair to the bed in the garden. My experience of this method is, that in many cases such beds are mostly in some out of the way corner, where they are seldom

Digitized by Google

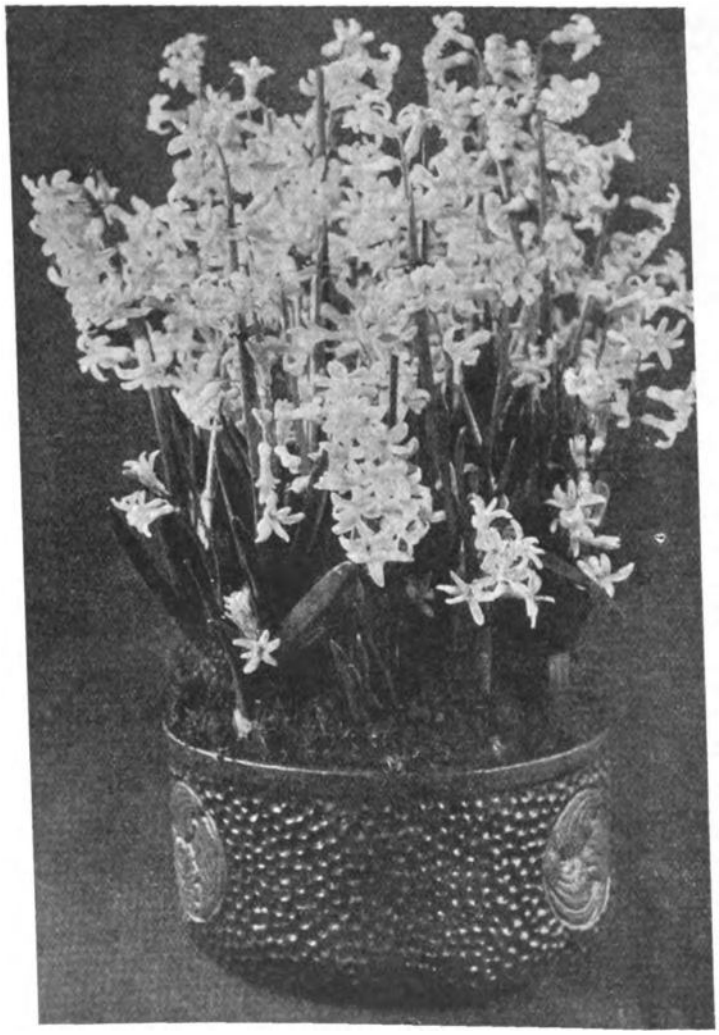
interfered with, which means that they are often neglected and allowed to run riot, so that instead of the fat, individual crowns we seek, we only find thin, weakly, overcrowded roots, quite unfitted for the purpose of producing flowers of quality under glass. Like their fellows in one of the Derbyshire dales we are acquainted with, they have become so overrun and crowded that the blossoms have degenerated into insignificant little bells on thin stems, unworthy of comparison with crowns that have been planted out and grown in generously manured ground for a couple of seasons before being lifted. It is almost useless to expect good results unless the home-grown article has been specially prepared, as to pot up thin crowns from beds in a garden that have not been prepared, only ends in disappointment. Where this obtains, the better plan is to purchase from a reliable bulb firm. To ensure lily of the valley crowns from the home garden one needs to select the strongest after the flowering period, and plant out as suggested 6ins. or 8ins. apart. It is only these prepared crowns that are worth considering for forcing and they must, of course, be given some months in a cold frame or outhouse, away from the light, before they are introduced to even the slightest heat.—W. LINDERS LEA.

BULBS FOR CHRISTMAS FLOWERING.

NO time should be lost in planting the bulbs required for Christmas flowering. All dealers make a special feature of early blooming bulbs for culture in bowls of fibre and any of these will do equally well in pots or boxes of soil. To-day there is a good selection of subjects which include the paper white narcissi, Roman and Italian hyacinths, early-flowering tulips, etc. Make a point of buying bulbs which are specially sold for culture in pots; those which are sold for planting in the open often give poor results indoors. Deal with a reliable firm; you may have to pay a little more money, but only the best bulbs are worth troubling about in this case.

All bulbs grown in bowls or pots must be given as long a time for rooting as possible. If you want to make sure of flowers for Christmas, the bulbs should be planted quite by the end of August. Plant each bulb firmly, pressing down the fibre or soil well. Most bulbs are strong rooting and unless they are securely held they are likely to force themselves upwards. Insert the bulb so that the crown is just clear of the rooting medium. If the fibre or soil is reasonably moist no further water should be given.

Newly planted bulbs should never be placed in a strong light. This will encourage the growth of the top shoot before the roots are well developed, and, as a result, the flowers will be poor and stunted. It is better to keep the bulbs in a semi-dark place for two months or, in the case of hyacinths and tulips, even longer. Bulbs grown in pots or boxes may be placed in some corner of the garden and covered 6ins. deep in fibre or dead leaves. Straw is not suitable, for this is apt to go mouldy when it becomes damp. Bulbs in bowls may be stored away on a shelf away from the light. A position in a dark shed or a cellar is very suitable. After about ten days test the fibre to see if it is getting dry. Then a little water may be given and as active rooting starts, more moisture will be required. Never let the fibre get into a sodden state, however, as without a big top growth the bulbs are not able to get rid of the water they absorb very freely. Narcissi should be watched closely. These take root very soon and at once a vigorous growth of the shoot starts. If this is allowed to proceed too far the plants will be very ungainly. When the shoots are about 4ins. high it is better to bring the bowls into a cool greenhouse or a light room. Hyacinths and tulips may be given much longer in the darkness and, in fact, within reason, the time allowed cannot well be too long.



A FINE BOWL OF ROMAN HYACINTHS AT CHRISTMAS-TIME.

By following the plan indicated the bulbs can be brought to full beauty in about four months from planting and this without any more heat than is to be found in an ordinary room.

The early flowering bulbs lend themselves to novel methods of culture. For instance, charming effects are produced by planting in large shells. Such shells can usually be obtained for a small sum from second-hand shops and it is well to select those with fairly capacious interiors. Fibre is used in the same way as when bowls are used for planting. The effect is all the better if lawn grass seed is thickly sown on the fibre. The grass seed need not be sown until the flower buds are showing, as it grows quickly and rapidly covers the fibre with greenery. Another way is to plant some of the bulbs in a sponge. Secure a large sponge which is rounded in shape. When the sponge is dry cut slits and, in these, insert the bulbs. For this purpose it will be found that Roman hyacinths are the best. Narcissi and tulips are not so satisfactory. Then loop twine round the sponge so that it can be suspended. Soak the whole thing in water for a few hours and, after draining, hang up in some dark position. As required, give the sponge further soakings and, when the bulbs show signs of having rooted, hang the sponge in a light warm room. The sponge may be hidden by sprinkling grass seed all over it or covering it with green moss. The moss is easily tied in place with a little cotton. When the bulbs are in flower a pretty hanging garden is the result.

—S. LEONARD BASTIN, *Bournemouth.*

SPECIMEN COLEUS.

SPECIMENS of these beautiful foliage plants make a splendid display in the greenhouse or conservatory during the summer months and most flower show schedules include classes in which they may be entered. Given a warm greenhouse in which to house them during the winter, their culture presents no difficulties.

Cuttings may be secured from mid-August onwards, firm, short-jointed shoots about 3ins. in length being chosen for this purpose. It is frequently recommended that these should be inserted singly in thumb pots, but, personally, I prefer to strike them in boxes and afterwards pot them up, as I believe that under this treatment a batch of cuttings roots quicker and more evenly than if placed singly in pots. In any case a fine, sandy compost should be used, and after insertion the pots or boxes of cuttings should be well watered and placed in a shaded and close house or pit for about three weeks. When rooted they must be potted into 3in. pots and returned to the propagating house for a few days, after which they should be placed on a shelf in a greenhouse. Fully expose to the sun and air to harden and prepare the plants for the dull winter months. A soft, sappy plant is apt to collapse during this period.

As winter advances remove to the warmest part of the house or to a stove and water sparingly. It will be unnecessary to repot until the days begin to lengthen, and only then when the plants commence growing. Give 4in. pots, using a compost composed of equal parts loam and leaf-mould with a liberal addition of mortar rubble and sand. Place on a shelf, and when growth has restarted pinch out the top of the leading shoot to encourage a bushy growth.

As soon as these pots are filled round with roots repot into 6in. pots, using a similar compost as before. Provide three stakes and lay a good foundation by tying all side shoots out as widely as possible. Pinch all shoots at the third or fourth leaf to ensure the formation of a bushy plant.

When ready transfer to 9in. pots, this time using a richer compost consisting of loam two parts, rotted manure one part, leaf-mould one part, with sand, mortar rubble, bone-meal, wood-ashes and charcoal at the discretion of the mixer. Pot firmly

Digitized by Google

and before the pots become full of roots shift on into the 12in. size, again using a rich medium. If allowed to become at all pot-bound they have a tendency to lose their lower leaves and flower prematurely.

Final staking must be attended to after this last shift, and constant tying and pinching will be necessary. Watering must not be neglected and a moist atmosphere assists growth. Fully expose the plants to the sun and turn them every few days in order to obtain perfectly balanced specimens. The application of nourishment in the form of liquid manure, soot water and a good fertiliser will be beneficial when the pots are full of roots.

While growing, a temperature of 65° to 90°Fahr. suits coleus, but when fully grown a lower temperature is desirable. In this way specimen plants 6ft. high and as much through may be grown.—T. H. EVERETT.

HOW TO DRY OFF GLOXINIAS, ETC.

MANY amateurs are able to grow fine specimen plants of gloxinias, begonias, etc., during the summer months, but fail to dry off the bulbs and winter them successfully. In these days fire heat is not very general for the benefit of greenhouse plants, and those that are grown under cooler conditions are sturdier than the specimens that are more coddled. I may say for the benefit of amateurs who do depend upon the sun heat that the bulbs will winter better than those grown in higher temperatures. But a lot depends upon the way that the bulbs are treated when active growth of stem and leaf ceases. Cold conditions and excessive moisture will result in decay, and great heat during the winter will result in dry rot—so we must avoid these extremes. We will presume that the amateur has a batch of plants on his greenhouse stage. The plants are now showing the first signs of leaf-ripening. It is autumn-time and even evergreen plants must receive less water, naturally; how much more necessary is it that ripening bulbs should—less and less, until, in the course of several weeks, all water is withheld. The bulbs may be wintered in their pots or in leaf-soil or coconut fibre in boxes. I prefer the latter plan, as it economises space, which is a valuable asset in a small structure. Always avoid drip on the stored bulbs from plants on stages; also keep them quite 1ft. away from hot-water pipes and place boards on edge between the bulbs and the pipes, as wood is a non-conductor of heat.—G. G.

POTTING NERINES.

THE nerines are very beautiful Cape flowering bulbs, and are not at all difficult to grow successfully if certain points of management are attended to. The inexperienced amateur cultivator who may possess a few bulbs should err on the side of not repotting at all rather than run the risk of over-potting. The plants will do nicely in pots for several years without any repotting if they are neatly top-dressed. An ideal compost for this top-dressing will be found in mixing the following ingredients: a good fibrous yellow loam two-thirds; leaf-soil, one-third, with sufficient coarse sand to make all porous. The plants make their new growth during the winter—maturing it then—and it is directly after the flowers have faded that the top-dressing material should be applied. It is equally important that a good compost be used for the potting of the bulbs, as fine flowers depend to a great extent on the strength of the new growth. Some of the species flower before the leaves appear and some bear the flower-stems with the leaves. The actual growing period is from September to May. The foliage then dies down and water must be withheld. Both potted and unpotted plants should be placed in a sunny position. To make sure that the bulbs will be kept dry during showery weather, place the pots under well raised frame lights. Pot firmly and provide sound drainage in each pot.—HANTS.

FRUIT AND VEGETABLES

LIFTING AND STORING EARLY POTATOES, INCLUDING SEED TUBERS.

AS the disease has attacked many plantations of potatoes throughout the country, it is advisable to lift and store all early and second-early varieties before the end of August. In every case where this work is being done the lifting should cease if rain comes. Do not subject the tubers—store or seed—to any rain if it can be avoided, as such tubers always become diseased sooner in the store than others not exposed to any rains.

Before the general lifting of the crop is commenced it is a good plan to lift carefully all the roots showing the strongest and greenest haulm, selecting the best tubers for seed purposes; these, if not as ripe as others, will make the best seed for next year's planting. Grade all tubers as they are taken out of the soil—those of first size, the seed tubers and the "chats" or very small ones only suitable for boiling for fowls or pigs. One hour's exposure to the air will be beneficial in dry weather. Now, there should be two prepared places for the two sets of tubers before any are lifted, namely, an open, cool, dry shed for the big tubers wherein they may remain in a layer 1ft. deep for one week prior to storing finally, and be covered during this time with empty sacks. At the end of the week one more careful examination will be necessary, to pick out any diseased tubers. The other prepared place should be a cold frame where the seed tubers can be placed in a thin layer to "green" with glass lights well raised above them. Failing a frame and lights, an open shed with a north aspect will do. The seed tubers should be turned over twice prior to storing in boxes or on shelves for the winter.—GEO. GARNER.

FRUIT.

When it is Ready for Picking. MANY kinds of apples and pears must be gathered before they are ripe to the taste and allowed to mature in store. It is most important that these should be picked at the right time, as if they are removed from the tree too soon they will shrivel and spoil. On the other hand, if the fruit is allowed to hang too long there is a risk that a certain amount of it may tumble to the ground. In the case of apples, a sufficient sign will be the change in colour and the dropping of a few sound fruits to the ground. Be sure that the fallen apples are really sound, as, of course, fruits often fall prematurely owing to the presence of maggots. Pears are usually much more difficult to deal with. The early kinds, such as the Jargonelle, are often rotten almost as soon as they are ripe, and they have to be eaten straight from the tree. A useful test, which will not seriously harm the fruit, is to pinch very slightly close to the stalk. If the pear is ripe there will be a little "give." After a little practice it is easy to tell in a moment if the fruit is ready for picking without anything like hard pinching, such as would make a bruise. Of course, the later sorts of pears which will have to be ripened in store for winter use cannot be tested in this way. The following is the best way of finding out whether gathering time has come. Hold the spray which is bearing the fruit with the left hand, then gently grasp the pear with the right hand and lift slowly upwards. If the fruit stalk comes away readily the time for gathering has come. Where the stalk still shows a firm attachment the fruit should be allowed to remain. In the case of fine pears it is really a good plan to spread the gathering over a few occasions. Some specimens may require to hang a little longer than others if they are to be picked just at the right moment.—L. B.

THE PRODUCTION OF NEW FLOWERS

JUST now, when a wide range of flowering plants are at their best, many admirers will wonder how such diversity of colour and form has come into being. Some gardeners are beginning to question the value of the constant stream of "novelties," particularly those introductions showing only very small varietal differences, which inundate the horticultural world. It seems safe to prophesy, however, that so long as a demand exists, with its consequent profit, not to speak of the interest which attaches to the work of production, amateurs and professionals will make little attempt to stem the tide. Indeed, the urge to "improve" plants and increase the present range seems to be inherent in every gardener, and therefore some notes on practical methods will be of more than limited interest.

By far the greater number of new varieties within the species at present cultivated have arisen as the result of cross-pollination and consequent re-combination in one plant of different varietal characters derived from the parents. The cross in question may have been deliberately made by man or by any of the pollinating agents of nature, with, however, the same result on the plant in both cases. It is always more interesting, and subsequent work may be greatly facilitated, if the parents of the cross are definitely known. Also, after a deliberate cross great variation in the stock is expected, and there is less likelihood of a valuable type being overlooked, as is the case if the chance product of natural crossing is relied upon. Almost every commercial grower, however, makes a regular round of his cultures, primarily to pull out undesirable intruders or "rogues," as they are called, but also to see that any "novelty" of value is not overlooked. Though the writer would advocate hand-crossing, the great possible value of chance "sports" must not be overlooked, because it is by chance and chance alone that really new "breaks" arise. These very rare true "breaks" or mutations as they are called, differ from

Digitized by Google

variations following a cross in that they are the result of fundamental changes in the constitution of the plant. Unfortunately, no method has been found for producing mutations, though they provide the raw material for extended hybridisation. An instance of this was seen when the Spencer type of sweet pea arose, for a complete new range of varieties in this species became possible by the combination of all the then existing colours with the new type of frilled petals.

HOW CROSSING CAN BE ACCOMPLISHED.

Before going on to describe how desirable innovations may be treated, it will be valuable to give in outline how a hand-cross is accomplished. The work is extremely simple, requiring neither intricate nor expensive apparatus. All that is essential is a fine pair of forceps, some soft copper wire, and a number of blossom bags such as are supplied by seedsmen and florists.

In brief, a cross is complete when *pure* pollen from one variety is applied to the virgin stigma of another. For this purpose pure pollen is ensured by enclosing forward but unopened buds in blossom bags, fastened securely with copper wire wrapped round the stem. The bags prevent insect visitation.

Stigmas entirely free from pollen are then arranged for by gently opening buds at the same stage with the forceps and abstracting the undamaged stamens. Protection from contamination is again secured by covering the buds with blossom bags.

When these flowers from which the stamens have been taken bloom within the bags and their stigmas are seen to be slightly glistening, the transference of pollen may be made. First of all, loosen the bag protecting one of the flowers selected for pollen production on one variety, and then loosen the bag on an emasculated flower of the other variety. A burst stamen with adherent ripe pollen is then pulled out with the forceps from the first and applied to the stigma of the second, the bag being replaced on the seed parent at once. This procedure is continued until all the emasculated flowers have received pollen from the opposite variety.

A METHOD TO BE FOLLOWED TO ENSURE SUCCESS.

The bags should be off and the flowers left uncovered for as short a time as possible, though it is often advisable to repeat the pollination of each flower on a following day so as to ensure that fresh living pollen reaches the stigma when it is really in a receptive state. As a further precaution the cross should be made in both directions, that is to say, pollen should be transferred from what we may call variety A to the stigma of an emasculated flower of variety B, and from variety B to an emasculated flower of variety A. This practically ensures that a cross, if at all possible, will be successful, even if the work has not been too cleanly done. In this connection it might be noted that research workers in the pollination work rub their hands and instruments with a little strong spirit and allow it to dry before proceeding to the next stage. The spirit kills any adherent pollen which might otherwise cause contamination and upset results. This is a refinement which might well be adopted by all workers. If the flowers are labelled and brief notes made at each stage, a further interest is added to the work later on.

The protecting bags are left on the flowers which were emasculated and received pollen until the fruit sets, and maturation is allowed to continue naturally.

Let it now be supposed that the cross has been successful and good seed produced. This must be harvested and sown by itself when the appropriate sowing date for the species comes round. The resulting plants will in all likelihood disappoint the novice because none of them "will fill his eye." This is one

A BLOSSOM BAG IN POSITION ON FLOWERS SELECTED FOR CROSSING.

point where patience comes into plant breeding. These plants of the first generation must be grown on, their seed saved, and in turn sown. Among the plants of this second generation great variation may be expected, the number of different types depending on the degree of difference which existed between the two parents. It is quite reasonable to suppose that among the array at least one plant satisfies the breeder and he decides to proceed with it.

FIXING A NOVELTY.

From this point, in commercial work, all kinds of selections are treated alike, whether they originate as the result of a deliberate cross, such as has just been described, from a natural cross or from a mutation, and the following notes can apply to all of them. The first step is to "fix" the "novelty." This means to obtain it in a pure-breeding non-varying state so that all its progeny will be alike and like the parent. It is clear that if one wishes to prevent further variation in a plant it is absolutely necessary to prevent its most common cause, namely, cross-pollination. Therefore, when the desirable type arises it must be isolated so that no pollen but its own reaches its stigma.

The simplest way of ensuring this is to remove the plant to another station sufficiently distant from all other species with which it crosses. This is not always practicable, except with plants in pots, and the more usual way is to protect the flowers as they open by means of the blossom bags already mentioned. The whole plant may be protected by one very large bag made of paper or tiffany, but this is not often satisfactory, and with a large number of species one or two well filled fruits produced under small individual bags, such as were used in the crossing work, yield sufficient seed to sow all the land available.

The seed which is produced, no matter what system of isolation is adopted, should be sown as far away as possible from any other with which it will cross, and it is possible that the plants may come true.

THE IMPORTANCE OF SINGLE PLANT SELECTION.

The matter is not always so simple, however, and the selection may behave like the first generation from a cross and split up, though the range of variation will not be so great. At this point one with a knowledge of Mendelism may form some opinion as to whether the type is really fixable or not; some types are unfixable and their character depends on their hybrid nature. Should it be decided to go on with the work, a number of plants which come up to the type should be isolated *separately*, in the same way as was done with the original selection, and their seed harvested and sown *separately*, when it may be expected that if the type is really fixable, one of the lines will come true. As soon as one line does come true, all the others should be scrapped, the true one multiplied, tried once again, and then introduced to a critical world. The essence of this whole method of obtaining fixity is the keeping of selections and lines absolutely separate both at flowering and sowing time.

Single plant selection, as the method outlined above is called, requires detailed attention and time on the part of the worker, but in terms of plant generations it is very much more rapid than any other method of selection, and real fixity is obtained.

Special cases arise requiring special treatment. Sometimes the first hybrid generation following the cross is sterile, or, again, the selected type may be sterile, but all the complications only add further interest to the work.

Breeding, selecting and fixing novelties, as has just been shown, demands a full measure of patience, but to one who knows and loves flowers the development of a favourite species in a quiet garden provides a restful counter-interest to these nerve-racking days of hustle and hurry. ALEXANDER NELSON.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque ..	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty ..	Pale rose and deep red.
Lohengrin ..	Cattleya mauve.
Mdm. Chereau ..	White, frilled azure blue.
Mrs. H. Darwin ..	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme ..	Pure blue and blue purple.
Prosper Laugier ..	Bronzy cinnamon and velvety crimson.
Rhein Nixe ..	White and violet purple.

One plant each of the 12 varieties, **7/6** post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

ENTERPRISING HOLLAND

AMATEUR as well as professional and commercial horticulturists are well acquainted with the vastness and importance of Holland's bulb industry, large numbers of holiday-makers as well as business men visiting the district of which Haarlem may be described as headquarters to see the far-reaching fields of hyacinths, tulips and daffodils when in full bloom. It is also fairly well known that in the Boskoop district, tree and shrub nurseries and rose and azalea nurseries flourish, mainly by reason of the huge export trade carried on with Britain, Germany and America; but I have another story to tell of a comparatively new and rapidly developing industry which is being quietly carried on in a district of Holland which is somewhat off the beaten track of the tourist, and that, for some reason, appears to pass unnoticed by our own commercial horticulturists.

It was by the courtesy of Messrs. Murphy and Son, Limited, of Mortlake, that I was a fortunate member of a party of some thirty horticulturists and chemists to the trade who visited the province of Zeeland, and the Isle of Walcheren, and there discovered a prosperous colony of fruit growers whose orchards, on some thousands of acres of rich reclaimed land which is of totally different character from either the peaty soil of Boskoop or the light sands of the bulb fields, are planted with all the best English varieties of gooseberries, currants and other soft fruits, interspersed with carefully selected apples, pears, plums and cherries, the whole being cultivated in the thoroughly efficient manner which is characteristic of the Dutchman, no matter what he may undertake.

A point of vital importance, not only to our own fruit farmers and market gardeners but to every Britisher who realises what food production and commerce mean, is that the definitely avowed aim of this modern Dutch enterprise is to cater for the British market in soft fruit, both in London and in our jam factories. With that end in view our popular varieties of fruits have taken the place of old Dutch varieties, but not until practically every known variety had been put to test in the exceedingly well organised and controlled demonstration garden, which is run for the instruction and assistance of the landholders at the expense of the Dutch Government.

Capacity for taking infinite pains in order to achieve desired ends is a characteristic of the Dutch which compels admiration, and coupled with this is an eager willingness on the part of all concerned to help in every possible way to develop the industry and increase the prosperity of the country. Wealthy merchants of Rotterdam and Amsterdam finance land reclamation schemes; the Government conducts scientific research and places valuable information at the disposal of the growers. The landholders stock every bit of land with the best things it can grow, always with an eye to its popularity and suitability for some particular market. The peasant works industriously and carefully, not merely to secure his wages but to help his employer to maintain his business in a sound condition and, most of all, to benefit Holland and increase her prosperity. The railways and the shipping companies do their utmost to make transport reliable and cheap, so that Dutch produce may compete on the open market of Europe on the most favourable terms. And even in the matter of affording every possible facility to British visitors to see what Holland is producing, where and how it is produced and handled, the greatest possible care is taken by officials, who seem to realise that thus they are helping to create a good impression upon those whom their country seeks to make customers. Even the café proprietor and the tobacconist reveal an eager desire to know whether the English visitor is impressed with the orchards and the big industry of the province.

All this may, on the face of it, appear to be a matter of interest and concern only to our own fruit growers and market gardeners, whose business it is to meet as best they can the competition with which they are confronted. That, surely, is a fallacious idea, for the welfare of any home industry is of material concern to us, even as the industries of Holland are to every Dutchman.

The question we, as Britishers, have to consider is to what extent is it or should it be necessary for English money to go abroad to purchase gooseberries, currants, strawberries or cherries?

In the first place, it may reasonably be held that if Dutch fruit can be placed on the English market at cheaper prices than home-grown produce, it is to the general good; but we do well to ask why it should be cheaper. Land is as expensive as the best of English land; wages are about level with the customary wages in England—but every hand works with a will to do his utmost. Seasons are as variable as our own, and cultural routine is just as intricate. The one outstanding advantage in the Dutchman's favour appears to be the extremely favourable co-operation of the transport organisations inland as well as overseas, and it seems an extraordinary thing that produce grown in Holland can be conveyed to Flushing, shipped to Folkestone and railed to London cheaper and with less delay than it can be conveyed to London from our own fruit farms. This is a matter which concerns every British citizen as well as the fruit grower, and it should be a matter for searching enquiry and insistent united effort to secure amendment.

Another question is, can we or can we not produce sufficient of these fruits to meet all the demands of our densely populated island? If we cannot, let us be thankful to receive the produce of Holland, for "Eat more fruit" is something more than a mere slogan.

Before dismissing this question, let us consider the possibility of producing what we require. We may leave the purely commercial aspect of the problem to be dealt with in its proper sphere; but, apart altogether from that, there is the question of the average private garden. It may appear to be stretching imagination to claim that the produce of half a dozen gooseberry or currant bushes in a small home garden bears any relation to the revenue of the country; but, multiplied by the number of gardens in which some fruit might be grown where none grows to-day, and with the addition of gardens where diseased, worn-out or inferior fruits might be replaced with healthy stock of the best varieties and where cultural methods might be improved, the possibilities assume proportions which would be capable of making a vast difference to the need for importation of fruit and consequent departure of cash from our country.

Viewed in this light, the whole problem becomes of direct personal concern to every amateur or private gardener as well as to the commercial gardener. It brings into relief the national and economic importance of the mission which THE GARDEN and all the output of horticultural literature strives to fill, and it reveals the fact that the nurseries as well as the fruit farms of this country are something more than mere sources of profit to their proprietors, but are establishments of national importance which place at the disposal of all who occupy a patch of soil, stock which will help to reduce the country's foreign bills for foodstuffs of highest importance to the health of the people.

EXHIBITION TULIPS

ENJOY THE RAREST AND BEST, A LIST OF TULIPS THAT NEED NO INTRODUCTION. They are the acknowledged "STANDARDS" for Bedding as well as for Cutting.

	per doz	per 100
THE DARWINS.—The most sturdy growing strong upright stems with massive flowers:		
BARTIGON, bright fiery red	1/6	10/-
CLARA BUTT, clear pink, flushed salmon rose	1/-	7/-
LA NOTRE, rose pink shading to silvery pink, centre blue and white. EXTRA FORCER	2/-	14/-
PRINCE OF THE NETHERLANDS, extra large solid flower of perfect form, rich brilliant cerise red, extra strong stems. First rate bedder	2/6	15/-
PROFESSOR RAUWENHOFF, deep cherry rose, white base margined blue	2/-	12/-
PRINCESS ELIZABETH, extra fine rich soft rose, slight silvery flush at margin, centre clear white	2/-	14/-
WM. COPELAND, violet shading to lilac, when forced the colour is a beautiful soft lavender	1/-	8/-
The above 7 varieties, 12 bulbs of each		10/-
The above 7 varieties 100 bulbs of each		£3 10/-

NOVELTY COLLECTION.

THE COTTAGE TULIPS.—The most graceful novelties:		
AMBER, light amber coloured. Award of Merit	1/10	13/-
ERASMUS, large creamy white, long stem. Award of Merit	1/10	13/-
GRAND YELLOW, very deep yellow, extra fine	2/-	15/-
MRS. FRANCIS KING, very fine satiny rose	1/10	13/-
NECTAR, vivid carmine red with clear white base. Award of Merit	2/-	15/-
SIRENE, the wonderful lily-shaped flower of a very fine glistening satiny rose. First Class Certificate, London, Amsterdam	1/10	14/-
SPINOSA, white flower on very tall stem	1/10	13/-
PEARL, finest light rose	2/-	15/-
PROF. WESTERDYK, wonderful lilac rose, very tall, splendid forcer	2/-	15/-
TRITON, glowing carmine rose, pure yellow base, the most attractive tulip yet raised, a real beauty	2/-	10/-
Novelty Collection, ten extra selected bulbs of each of the above 10 varieties, 100 in all		10/-
25 bulbs of each of the above 10 varieties, 250 bulbs in all		20/-

QUALITY.—All bulbs which are not to satisfaction upon receipt may be returned to us and we will gladly refund money and postage. Complete list of other rarer tulips, daffodils, etc., gladly mailed on request.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE KITCHEN GARDEN.

No further time should be lost in sowing certain seeds, and every effort ought to be made to keep the garden free from weeds, then there will be less work in the autumn with its shorter days. The final sowing of cabbage can be made during the week or so, and this also applies to cauliflower. Select a variety such as May Queen, Early London or Autumn Giant, and when the plants are large enough prick a portion of the seedlings off in a cold frame without the lights so that protection can be afforded in winter if needed. A few should also be pricked out in the garden, selecting a warm, sheltered corner. Another sowing of cauliflower may be made early in September. Other seeds to sow now include onion, spinach, lettuce and spinach beet. The latter is a useful substitute for ordinary spinach. Continue to lift potatoes as they reach maturity, and earth up celery and leeks when the weather is dry.

Late peas will need watching for thrips, and if this pest is present the haulm must be sprayed with an approved insecticide. If the ground is dry, a heavy watering will be helpful. Where the winter greens are showing signs of being stunted, it is a useful practice to give each plant a teaspoonful of sulphate of ammonia when the weather is showery. This will stimulate growth, and the plants will grow freely afterwards.

THE FLOWER GARDEN.

Herbaceous borders will still require attention regarding staking and tying, the removal of seed-pods, dead flowers, and the trimming of plants that have passed their best. Dahlias, Michaelmas daisies and chrysanthemums need special mention, because they furnish a supply of bloom when other subjects have finished. If allowed to flop about they are useless for cutting purposes and, moreover, they present a neglected appearance in the garden. Pentstemons, such as Southgate Gem and Chester Scarlet, are fine plants for borders or beds, and to keep up a healthy stock cuttings should be obtained during the next few weeks. They will root in a cold frame or a well drained border. Select healthy non-flowering shoots as cuttings, and bear in mind that plants will often live through the winter for two or three years, and these make a very fine display the second season.

Trees and Shrubs.—Specimen trees, particularly conifers, must be watched and kept to one leader, so where two shoots are making headway one must be removed, or the tree will be spoilt. Shrubs are kept free from weeds, and all grafted examples ought to be examined occasionally for suckers, which must be ruthlessly cut out, or in time they will kill the plant. Rhododendrons and the beautiful Viburnum Carlesii are often troubled with sucker growths. If not already done, yew hedges should be clipped, also privet for the second time. Lonicera nitida is a good hedge plant, but I am afraid it requires more clipping to keep it neat and tidy than, say, privet.

THE HARDY FRUIT GARDEN.

I think the black currant crop has been a poor one in many districts owing to bad attacks of aphis and, perhaps, the "big bud" trouble. In some instances it may be advisable to clear the plantation and make another one on a different site. Where such a course is expedient, the old bushes should be grubbed up and burnt. Healthy trees will benefit by the annual pruning at this date, and this consists of thinning out the old branches so that the new shoots will derive the full benefit of sun and air. I do not advise the removal of trees if only moderately attacked with "big bud," because, if the necessary time and labour can be provided, this pest can be cured by frequent applications of quassia extract. The space recently occupied with bushes should be trenched, manured and given a sprinkling of fresh lime.

Early Apples.—Such varieties as Lady Sudeley, Beauty of Bath and Langley Pippin are approaching the ripening stage, and if not used directly they reach maturity they soon lose their flavour; in fact, Beauty of Bath is best eaten direct from the tree. Wasps may be destructive, so a hunt should be made for their nests, which are easily destroyed by cyanide of potassium. A small piece, the size of a cob nut, surrounded with wet cotton wool is placed at the entrance to the nest. Remember cyanide of potassium is a deadly poison, so reckless methods cannot be tolerated.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE KITCHEN GARDEN.

Lettuce.—Make a sowing now for transplanting to frames, and prick out into sheltered quarters varieties of proved hardiness from earlier sowings.

Radishes of the oval or round sorts can still be sown out of doors on a dry sunny border along with mustard and cress.

Endive should also be sown now for transplanting to frames in October. Plants reaching maturity should be blanched in numbers according to requirements by loosely tying up the leaves, or cover with inverted pots with the holes darkened.

Celery should be earthed up as required, taking the usual precaution of providing a fine soil carefully applied so that none reaches the centre of the plant. As earthing up checks growth, do not commence this work too soon. Continue to feed the plants with available liquid manure, and it is important at this period that they be sprayed regularly to create conditions unfavourable to fungus development.

Leeks in trenches, if the quality of soil necessitates this method of culture, may have blanching material applied as required. These and main-crop supplies growing in the ordinary way should be liberally fed, as a check through lack of food results in tough and strong produce.

Peas of late varieties, because of the extra attention in watering and feeding given to ensure a successful crop, usually outgrow the stakes provided for them, and should have additional support in the form of strings lengthwise on either side of the rows.

Spring Cabbage.—Anticipating the planting of these, take an early opportunity of preparing a place for them.

THE FLOWER GARDEN.

About this period wallflowers, cheiranthus, myosotis and other spring bedding plants will have made a good growth. In order to obtain plants for transplanting with a ball—an essential to success, and especially so in the case of wallflowers—with a garden fork partly lift these in a manner to rupture the strongest roots, afterwards retreading the plants firmly. Needless to say, a dull day is most suitable for the job, and if a light rain follows it is all to the good. Following the operation the plants make myriads of fine roots, which hold the soil when transplanting. It may be necessary to repeat the work if the plants are likely to become gross and unfit to stand the winter.

Violas.—It is not too soon to take cuttings of these, a supply of which is readily procured almost any time from well grown plants. I have always found that good and clean cuttings rooted early, and later inured by exposure, winter better than others taken at a later period. It may be the experience of some that violas are required for a certain position in the garden year after year. Such a procedure can only end disastrously for the viola stock in use. To enable one to carry on it is necessary to interchange the top spit of the bed with another from an adjacent vegetable brake, digging in quantities of manure to the bottom spit and renew the stock.

Pentstemons.—If available, the remarks re early-struck cuttings apply to these, and if the suggestions given in an earlier calendar as to putting out stock plants in the "reserve" and pinching out the flower buds have been followed, there will be a good supply of suitable growth for cuttings of the finer varieties.

Neither violas nor pentstemons are particular as regards a rooting medium, provided plenty of sand and leaf-soil are present. But in this, as in other matters pertaining to horticulture, attention to hygiene always pays.

Notes from Maidstone.

A NEW PEAR

WE would call the attention of all lovers of pears to the variety Admiral Gervais, which is fully described in our New Fruit Catalogue, which we think will be of great value. In appearance it much resembles Easter Beurré, but it ripens a little before this variety. It is a good grower, does equally well in the open as a Pyramid or a Cordon. We now introduce it after twelve years' trial and we can confidently recommend it for English gardens.

GARDEN PESTS

MANY gardens have been much bothered this year by the prevalence of garden pests, such as greenfly, wire worms and so on. The owners and gardeners have complained bitterly over their misfortune and have left it at that. Early in the year there was every reason to suppose that the hard weather experienced in the winter months would assist in clearing the garden of many pests. In a number of districts that hope has not materialised. The truth is that in many gardens those who work on the soil trust too much to luck and the season. The old rule of "prevention is better than cure" is not practised sufficiently. It is also true that many who use the latest methods of prevention and cure have been much bothered by pests, but they keep pegging away at spraying and so on, and ultimately the pest is brought under control and eradicated. On the other hand, there are many gardeners who are accustomed to keep their greenhouses and frames in spotless condition and yet do not bother with the garden outside. It is never wise to trust to luck, and so every effort should be made to *prevent* pests early in the season. Horticultural and agricultural chemistry is now so efficient that not only preventives but cures exist for almost every garden pest. They are inexpensive, and their use at all times is more than repaid by the improved appearance and better quality of your garden produce, whether it is fruit, flowers or vegetables. It is to be hoped that after this year's experience many who have suffered will have learned their lesson and realise that the policy of trusting to luck in the case of garden pests does not pay. Another point is that prevention is not such a laborious task as the cure, which sometimes takes more time than the gardener is able to afford.

E. H. M. C.

THIS week's plant is Potentilla fruticosa, which many will consider common enough, but whose popularity, oddly enough, seems to be confined to districts. In a note and following correspondence in THE GARDEN last year it was pointed out that there were many forms sold under various high-sounding names. As a matter of fact, all are good, but some are better than others. This late summer shrub, that is so free flowering over such a lengthy period is one of the most valuable plants that we have in the garden. The type, with lemon yellow flowers and greyish green leaves, is still probably one of the best. For those who wish various colours, P. Veitchii, with pure white flowers, and P. Vilmoriniana, with silvery leaves and creamy flowers, can be recommended. Potentillas will grow in any soil as long as the drainage is sufficient, and they have no objection to drought. They are easily propagated from cuttings. In some cases older plants have a habit of dying by bits and pieces; this can be avoided by cutting out old wood in early spring. This is particularly advisable in the richer soils where the plant is rather inclined to overgrow its strength. Dead wood gives an appearance of age that is entirely unnecessary.

POTENTILLA FRUTICOSA IS A FINE AUTUMN-FLOWERING SHRUB.

INDEX EXPURGATORIUS

A LIST OF PLANTS ONE OUGHT NOT TO GROW IN THE ROCK GARDEN.

BY DR. R. LLOYD PRAEGER.

OF lists and suggestions as to what we should grow in our rock gardens there is no end, and, indeed, one is embarrassed by the number of plants which are, one is assured, easy, appropriate and beautiful. It may be advantageous to approach the matter from the opposite standpoint and consider briefly what one ought *not* to grow in the rock garden. Large classes of plants are, of course, outside the question—trees, the larger shrubs and the denizens of the herbaceous border. I would add to these all "florists' flowers," whether large or small, perennial or annual, for I believe most gardeners will agree that carnations, clarkias or lobelia are not suitable in the rock garden. I wish rather to write about plants which are often offered as rock garden subjects, but which at least must be used with caution.

There are few of the smaller perennials, I think, that deserve full excommunication, and at the moment I can think of only two such. Once I saw Petasites fragrans described in the catalogue of a reputable firm as the beautiful winter heliotrope, deserving a place in every rock garden, fragrant, winter-flowering—in fact, a very gem among gems; whereas, of all the pestilent weeds——! It belongs to the worst class of weeds—those which have rapidly spreading underground stems, of which every scrap will grow. It can be cordially recommended for railway embankments, or for large areas of waste ground; but if you have a garden, it is scarcely safe to live in the same parish with it. If the least bit of it gets in, you will never get it out. But, all the same, it deserves its meed of praise. In the milder parts of our country its profusion of fragrant bloom in midwinter makes it a very welcome colonist—of somebody else's ground!

The other plant which is or ought to be anathema in the rock garden, although it figures in many nurserymen's catalogues, is that little fiend Helxine Solierolii. Its tiny green mat, resembling that of Arenaria balearica or Mentha Requienii, looks quite innocent; but once it gets among tuft-forming plants, or into the chinks of the stones, it is practically impossible to eradicate. It creeps rampantly and smothers one's smallest treasures while one's back is turned. Its flowers are microscopic, and it has nothing to recommend it.

It will be noted that while the first of these terrors does its fell work by means of subterranean activity, the other works openly on the surface. All the plants which in the rock garden need to be used with caution—if used at all—belong to one or other of these categories, with the exception of a few which propagate in inconvenient abundance by seed or by bulbils. The above-ground plants need not be feared by the watchful gardener; they put all their cards on the table, and can be dealt with accordingly. We have merely to exercise judgment in planting, and not mix the sheep with the goats, and all will be well.

Among the worst offenders are the acænas and cotulas, and other rock garden creepers, from the delightful but rampant Veronica filiformis down to Arenaria balearica. They must not be planted near the kabschia saxifrages and such-like jewels. But plant them along with arabis and alyssum, aubrietia and mossy saxifrages, and they will meet their match and fill their appointed place quite meekly. A few of the sedums, too, are in the same category—reflexum, rupestre, album, sexangulare and spurium in particular. Not only are they rapid spreaders, but scraps broken off will root anywhere—preferably in the heart of some treasure. Put them with their equals and they are all right, and in mass highly ornamental.

(To be concluded.)

ROSE NOTES FROM NORTHERN IRELAND

THERE is nothing very original, I am afraid, in an article on the Queen of Flowers. Undoubtedly, there are different roses for different districts and gardens, and, consequently, it is of interest to read of results and opinions from various parts of our islands—this is my excuse for the present effort.

Before mentioning the actual varieties, I may say that they have all been under personal observation, either in my own garden or elsewhere, and, consequently, the criticism, favourable or otherwise, is just the writer's candid opinion, and, as such, may be taken for what it is worth.

Hugh Dickson is still undoubtedly one of the best crimson roses for the garden, though it is rather too vigorous for bedding purposes; as a standard, however, it is second to none—its fragrance and fine colour are generally known; and so I pass on to General McArthur, another beautiful bright crimson, like the previous variety very sweetly scented, but, unlike it, in that it is a fine bedding rose. The colour is not so rich nor are the flowers so large as Hugh Dickson, but it should certainly find a place in every garden. General McArthur is particularly good in autumn, and the beautiful glossy deep green foliage keeps remarkably clean and fresh and seems practically immune from mildew.

Red Letter Day is another outstanding rose and a great favourite here; the nearly single flowers are freely produced, and hold their colour without any trace of the very objectionable "blue" that spoils so many of our crimson varieties. Red Letter Day, picked as a small bud, develops well in water and lasts for a surprisingly long time. It is altogether an ideal rose for garden and cutting, and is much better here than the somewhat similar K. of K.

Lieutenant Chauré is a fine deep crimson of a rather duller tone than the preceding; it is a good bedder, though not so free-flowering as General McArthur, but the flowers are well shaped, and it may certainly be recommended.

Augustus Hartmann is a rose of which I thought very highly a few seasons ago, but latterly it has not been so good, the colour lacking its former brilliance. At its best, the bright geranium red of the expanded blooms is very effective, but, unfortunately, it is variable, and also fragrance is lacking, though where it does well and keeps its true colour Augustus Hartmann is worth growing and is much more reliable than the newer orange cerise Lady Inchiquin, which, with us, has been very disappointing.

The Queen Alexandra Rose is startling in colour, but is by no means a favourite of mine, and I was greatly surprised to see the high place it occupied in the result of a recent newspaper ballot. The colour, to my mind, is rather artificial, and the flowers hang their heads badly—a very serious defect in a garden variety.

It is also, on account of its vivid colouring, a difficult rose to place well in a small garden where lack of space prevents the possibility of its being allowed a bed to itself.

Betty Uprichard is one of the best and most beautiful of modern varieties; the bright cerise shaded flowers are effective both in the garden and for house decoration. It is a good grower, and, altogether, a very desirable rose.

Lady Ashtown is almost my favourite pink variety, the beautifully shaped buds and flowers are freely produced and are of very pleasing and attractive colour. Its only real fault is that it is rather susceptible to mildew, which, alas! is the reason for the almost complete disappearance of Killarney, in the writer's opinion the most beautiful of all pinks.

Mrs. Henry Morse, salmon pink with paler reflex, is a fine variety that is probably one of the most popular of this section to-day. It is certainly a good bedding rose and one that should be freely planted, though it has not displaced Lady Ashtown in the writer's affections.

Such old favourites among the pinks as Caroline Testout, Mrs. John Laing and La France need only be mentioned here in passing; but I hope it will be many years before they disappear, as they are worth growing for their fragrance alone.

Los Angeles is a very fine salmon pink, shaded gold, that should be grown freely, as it is an ideal garden rose, reminiscent

Digitized by Google

of Lyon but of better habit, though, where it does well, Lyon is still to be recommended. Los Angeles lasts well, is nicely scented, and the individual blooms are of perfect shape.

Coming now to the large section covering flesh pink, salmon pink and pale rose, with or without copper and yellow shadings, I must first mention Lady Pirrie. This is one of the most delightful and generally useful of all garden and decorative roses. The flowers vary greatly in shade from copper pink to blush, according to the season, but are lovely at all times, especially in the bud stage, the fully opened blooms being thin. Lady Pirrie is an ideal bedding rose, and for cutting it gives delightful sprays far into the autumn.

Mme. Abel Chatenay, too well known to need description, may next be quoted, though in this variety we are dealing with an entirely different type, the flowers being large and full. Chatenay is not so good a bedder as Lady Pirrie, for the plants are somewhat straggling and untidy in growth, but against that the flowers retain their beauty for a considerably longer period.

Mme. Butterfly, flesh shaded salmon, is one of the most outstanding of the newer roses—it is a good grower with fine foliage and is fragrant, which, in these days of scentless novelties, is very important. Mme. Butterfly is, in my opinion, a better rose than Ophelia, from which it is a seedling.

Joseph Hill is an old favourite that is valuable for its finely shaped blooms—long and high centred; the colour, a blend of apricot and pink, is very lovely, though somewhat variable, while the bronze foliage is very fine.

Gorgeous, a blend of orange and deep pink that varies considerably in depth and attractiveness, is, at its best, a fine rose, but I would not include it where only a few sorts can be accommodated. Mrs. A. R. Waddell is a very attractive little rose of striking colour—deep copper and apricot; it is very thin, however, and consequently the beauty of the individual flower is very fleeting. Mrs. Alfred Tate, copper salmon and cream, is a lovely little rose with long narrow buds that are delightful.

I now come to the yellows, and shall probably cause surprise by heading them with an old variety, Harry Kirk, bright yellow in the bud stage, marked on the outside with crimson; on opening out the colour fades to creamy yellow. The flowers are freely produced far into the autumn, and the foliage is good—altogether, with us, a reliable garden variety.

WITH ITS GOLDEN YELLOW BLOOMS, CHRISTINE IS ONE OF THE FINEST OF BEDDING ROSES.

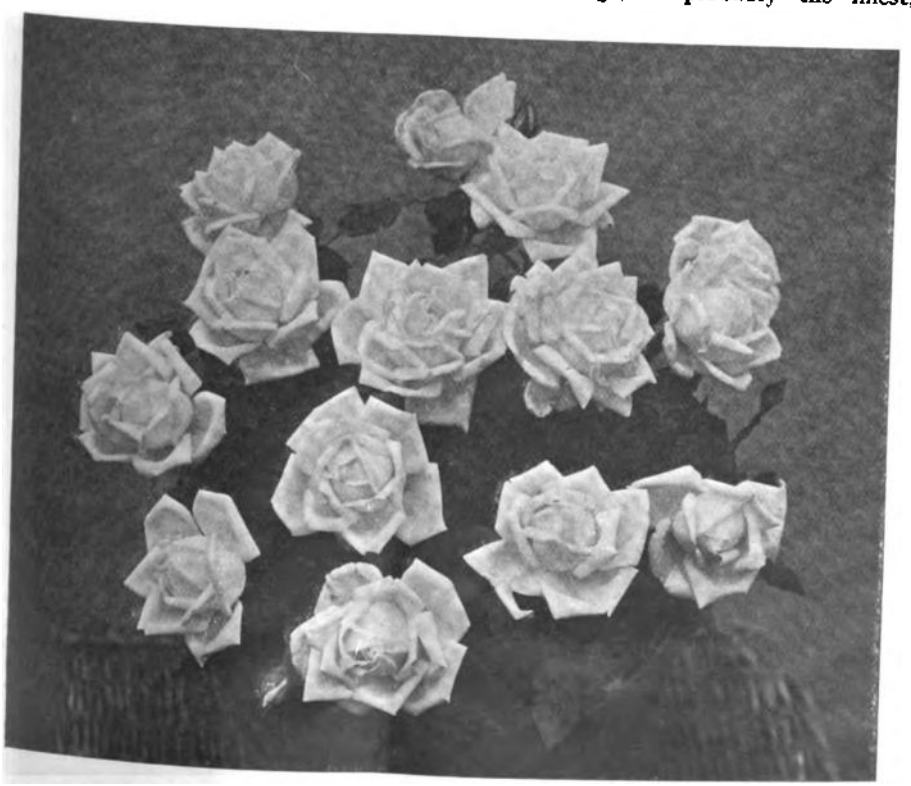
Among the newer varieties, Mabel Morse, golden yellow with glossy dark green foliage, is probably the finest, though it is very similar to the very popular Golden Emblem, which, where it does well, is magnificent, but its behaviour is very uncertain; in this garden Golden Emblem is very unsatisfactory, whereas as seen growing in the grounds of the Donard Nursery Company, Newcastle, County Down, it is really fine. Personally, I prefer Christine to either Mabel Morse or Golden Emblem, though it is a very much smaller rose and may be considered a purely garden variety—for bedding purposes it is first-rate, and the small bright golden-yellow buds are very refined and beautiful.

Souvenir de Claudius Pernet is another bright yellow, but of a different tone from the preceding—it is catalogued as sunflower yellow, and possibly this describes it fairly well—I do not consider it nearly so attractive.

Margaret Dickson Hamill, deep straw yellow, is an older variety and quite distinct from those previously noted. It is a fine garden rose, and may be planted with confidence.

In conclusion, I will name what I consider are the best dozen varieties out of those mentioned, for general garden use: (1) Hugh Dickson, (2) Lady Pirrie, (3) Harry Kirk, (4) Red Letter Day, (5) Betty Uprichard, (6) Los Angeles, (7) General McArthur, (8) Mme. Butterfly, (9) Mme. Abel Chatenay, (10) Lady Ashtown, (11) Margaret Dickson Hamill, (12) Isobel. If a white is desired, Druschki might be substituted for one or other of these.

CECIL M. BAILEY.



MARGARET DICKSON HAMILL, A GOOD ALL ROUND GARDEN ROSE.

THE FASCINATION OF PLANTS

THERE are many plants which, while not beautiful in themselves, yet exercise a great fascination upon the enthusiast. I write chiefly of alpine species, the smaller the better. This attraction, of course, does not exist for those people to whom a garden is a place showing masses of colour at some periods of the year and at others being quite uninteresting. It is to the real plant lover that these "ugly ducklings" appeal so much. To those who prize most highly the fact of having made another fractious little stranger from the mountain happy and "comfy."

I have a number of sunk gardens devoted almost entirely to those plants which are rare, small and possess that nameless fascination, and I spend many hours in silent examination of them, and whenever I pass that way always find time to see how they are faring.

To most people a very uninteresting plant is Scleranthus perennis, or S. biflorus, as it is often called. A little tight-growing plant like a tuft of greenish golden moss, with minute greeny flowers entirely without petals carried on quarter-inch stems. It is quite inconspicuous, and yet to many it has this all-redeeming fascination! It likes a sunny position in the "screeiest" of screes, or wedged between stones, where it soon makes a happy little tussock. It is very readily increased by division in the spring, and presents no great difficulty in cultivation.

Another plant of the greatest charm, and as yet quite a newcomer to me, is Acanthozonchus cervicornis. I have been growing it for but a few months, and it has already climbed to a very high place in my regard. It belongs to the sow thistle family, as the name suggests, but the suggestion is as far as the similarity extends. Its habit is that of a lowly hummock. The leaves are narrow, about 1in. to 1½ins. long, and strangely crinkled, with a toothed or serrated edge. About June–July it pushes up a growth of green, branched spines, like those seen upon Alyssum spinosum, but stouter and quite soft. After flowering these spines become hard and brown, and serve as a protection to the plants until the following summer, when the process is repeated, the old spines then dying off.

My plants have not yet flowered, but are just pushing forward their buds from the axils of the spiny growths, and I am waiting with great interest to see them open. I do not expect beauty, for the buds are very like those of a small groundsel flower, but the fascination of the plant is such to me that I often dash to it from other occupations just to refresh myself with its ever-increasing interest. As far as I can discover, it loves a full sun position and a free, well drained soil, and it is, I believe, perfectly hardy. It is very little known as yet, even in the specialist's garden, but I am sure that as it becomes distributed it will be a great favourite with the connoisseur.

Azorella pedunculariis, which comes from the mountains of Ecuador, is an extremely interesting plant of very close creeping habit, forming tight, hard cushions of fairly large green rosettes. The flowers are almost invisible and green, and consequently not worth worrying about. The plant is very happy planted in a sink, where it conceals the edge with its slow growth, and presses tightly and firmly to the stone in its progress.

Another interesting and uncommon plant, but one which is decidedly not without beauty, is Helipterum anthemioides. It throws up fragile growth very like a linum in appearance, surmounted by dainty white everlasting flowers. The individual flowers are about three-quarters of an inch across, and the whole plant is not more than a foot in height, perhaps not so much. It is quite suitable for the rock garden, and presents no difficulty of culture if given full sun and a well drained soil.

The same conditions apply very well to Helichrysum bracteatum—the wild species from Tasmania, not the garden forms—another attractive and little-known everlasting. The rather uninteresting foliage is amply compensated for during June and July by the large flowers borne singly on 6in. to 9in. stems. For the first few days before final development they present the appearance of bronze-coloured plovers' eggs, afterwards opening into lovely golden bronze paper daisies, quite flat and nearly 2ins. across. They are very attractive indeed, especially in sunshine. The leaves are grey green and short, making a carpet about 2ins. above the ground.

There is one of our own native plants, which, though fairly common, and not at all beautiful, yet thrills me afresh every time that I discover it growing in a spongy bog. This is Drosera rotundifolia. It has quaint little rounded leaves on 1in. long footstalks, their flat surfaces covered with tiny sticky knobs with which to retain the insects which form one of its chief means of sustenance. The whole plant is coloured bright red, and has tiny spikes of whitish flowers in June. In winter the plant dies down to a wee bud in the moss, and is quite invisible until the next April or early May. It is possible to cultivate it successfully in a pan in a cold house or frame. I have had it growing for several years under these conditions planted in sphagnum moss, and it is perfectly happy and contented.

There is a Drosera longifolia, not nearly so common as D. rotundifolia, and there is also an intermediate form which I have not yet found.

This charm of plants which would appear to be of nothing but botanical interest seems to me to be strangely akin to the fascination often exercised over women and children by very ugly men, as if, deprived of outward and visible beauty, they are given some inward gift of attraction. Be this how it may, it is there, and I would sooner have my ugly darlings than a garden full of flamboyant beauties like Oriental Poppies, etc. WILL INGWERSEN.

NOTES OF THE WEEK

DAPHNE BLAGAYANA.

THIS beautiful daphne opened its first flowers before the end of January this year and, the weather being mild, with them came the delicious, lily-like fragrance. With a good many people this is deemed an untrustworthy subject, fond of dying-off without any apparent cause, though given the best of attention. What it is that this plant considers essential to its happiness no one can say, for it will prosper in one garden and in another languish though the conditions appear to be exactly similar in both cases.

Though naturally a scree plant, a regular and plentiful supply of underground moisture is not a *sine qua non*, for my oldest and best plant is in the very dry sandy soil of a narrow border, not a couple of feet from the top of a retaining wall 8ft. high. This plant gets tree shade in summer practically all day until evening. It must sometimes get pretty dry, but it is never watered. I attribute our success with it to the top-dressing which is applied twice a year, *i.e.*, just after flowering and again in early autumn. This consists of leaf-mould and course sand, with a mere dash of light loam intermixed. Before the mulch is put on all the largest twigs are bent down, a stone sufficiently heavy to keep them firm is placed on each and the compost is then shaken all over the plant and pressed down until every branch is covered up to the foliage.

The above process continued it means, of course, that D. Blagayana will ultimately occupy a mound, with the tufts of leafage poking out between the stones all over it. But it appears that this is just what the plant likes. This counsel may not be very helpful to those who cannot get D. Blagayana to start at all, but, personally, I have had no difficulty in getting it established. A healthy pot plant is the first essential, and a moderately cool, but light, very gritty soil, well mixed through with old black leaf-soil, should do the rest.—A. T. J.

TRACHELIUM CŒRULEUM.

A Fine Plant for the Greenhouse.

TRACHELIUM CŒRULEUM is a most excellent and very effective pot plant for either greenhouse or house decoration. Those who have old plants that have finished flowering may readily raise a new stock. Points and side shoots should now be obtainable on the old plants which will make good cuttings. If the cuttings be inserted in sand in a frame, or round the sides of pots in light sandy soil and kept close for a week or two until they are able to stand ventilation, in a month or five weeks they should be ready to transfer to small pots. The potting soil may consist of about equal parts of loam and leaf-mould and about one or two parts rough sand or sifted lime rubble. To obtain good plants by flowering time, after the plants have attained the height of 6ins. to 8ins. the points should be pinched out. As the plants grow the pinching of side shoots should be regularly attended to in order to have bushy plants. The plants will require to be potted on as they require it until they are in the size of pot it is desired to flower them in. The soil for the final

Digitized by Google

potting should be used rather rough and consist of good fibrous loam broken up, about three parts to one of half-decayed leaves, one part broken lime rubble with a good dusting of bone meal. The trachelium is almost hardy, as last winter I had some old plants which came through the winter in the open. The tops were frosted to ground-level with 30° of frost, but in spring fine shoots came away from the base again. On no account should the plants be coddled, and they ought to have cold frame treatment until they can be transferred to a cool greenhouse. Usually this plant is raised from a July sowing of seeds or in early spring, but plants grown from cuttings will give excellent results. From the conspicuous absence of this plant in greenhouses in this part of Scotland I cannot think it is sufficiently well known. If once grown and treated as I have outlined, I am sure its beautiful heads of mauve flowers will be appreciated by all, so much that a place will always be found for it in the greenhouse or conservatory.—WM. GRANT, *Kincardineshire.*

A GOOD CHERRY-LAUREL.

THE hardiest of all known cherry-laurels comes from the Shipka Pass in Bulgaria. Forty years ago Prunus Laurocerasus schipkænsis was introduced into cultivation, and has proved hardy even in the colder parts. In the Balkans it grows in half-shady places under trees, forming low, broad bushes mostly of less than 3ft. in height. Several vary as to the shape of the leaves. The typical one with leaves over 1½ins. wide is often called var. Mischeana, while a narrow-leaved form with almost willow-like leaves bears the name var. Zabeliana. The last one is the hardiest form of a cherry-laurel I know. It always remains a rather low shrub, but in cultivation reaches 6ft.

Like most of the broad-leaved evergreens, the cherry-laurel is a hungry plant. To get good strong specimens with a fine shining foliage it is necessary to feed them well. Healthy plants are, however, of exceptional beauty the whole year round, especially in winter, as undergrowth between thinly planted pines. In colder areas the plants suffer during the winter, not from frost but from dryness. If we give a lot of liquid cow manure early in spring and a good cover of compost upon the roots, the plants can stand a good deal of frost.

All forms of the cherry-laurel can be pruned rather heavily. The propagation is very easy and is by cuttings in late summer.—CAMILLO SCHNEIDER.

ONE OF THE FINEST OF HARDY BROAD-LEAVED EVERGREENS, PRUNUS LAUROCERASUS

TWO GOOD BUDDLEIAS.

TWENTY-FIVE years ago I first met with the fine Buddleia Colvilei of which Sir Joseph Hooker said that it is the handsomest of all Himalayan shrubs, in the famous gardens of the late Sir Thomas Hanbury at La Mortola on the Italian Riviera. The tallest plant of it I saw in the open, stood, and is probably still standing, in the well known garden of the late Mr. Allard at La Maulevrie, near Angers, in western France. Here I took the accompanying picture a good many years ago. Unfortunately, the plant was not in flower at this time, but in England I had the opportunity to see flowering plants, mostly grown against a wall. The flowers appear in June at the tips of the young terminal shoots in pendent panicles, as is the case in other species, but the individual flowers are rather large, measuring over ¾in. across. The corolla is of a beautiful deep rose colour whitish in the throat, in its shape not unlike that of a beard-tongue. The elliptical-lanceolate leaves measure up to 10ins. in length.

A HANDSOME SPECIMEN OF BUDDLEIA COLVILEI.

Sir Joseph Hooker brought it to England in 1849 from the higher regions of the Sikkim-Himalaya. B. Colvilei needs a well drained, rather rich soil and a sheltered, sunny position to form a good flowering bush.

Another very distinct and handsome species of the genus is B. globosa from South America (Chile). It has a more open, loosely branched habit and smaller leaves that bear a yellowish tomentum beneath. The flowers are arranged in globular heads, and therefore the inflorescences look quite different from those of the other well known species. They are orange-yellow and very fragrant, appearing in June. They are easily propagated by cuttings in late summer. —C. S.

TWO INTERESTING TRAILING SHRUBS.

LINNEA BOREALIS (the twin flower).—This fragrant trailing shrub has been in flower all the summer. It has a slender red brown stem, trailing from 2ft. to 3ft., with evergreen small, round leaves. Its flowers resemble small pink bells, always in pairs, and are delightfully attractive. It should be planted with plenty of leaf-soil in a shaded, moist position. It is easily propagated by cuttings taken in the spring.

Mitchella repens (the twin berry).—This beautiful little trailer has rounded opposite leaves, bright green in colour with prominent white veins on creeping stems from 6ins. to 12ins. long. The flowers, which appear in pairs after the fashion of Linnea borealis, are bell shaped and of a soft pink colour. Red berries follow these, which are its greatest charm, presenting a vivid contrast to its bright green foliage. The twin berry is of easy culture, liking sun or shade, and may be propagated by cuttings.—R. MOORE, *Thorpe Hall.*

Digitized by Google

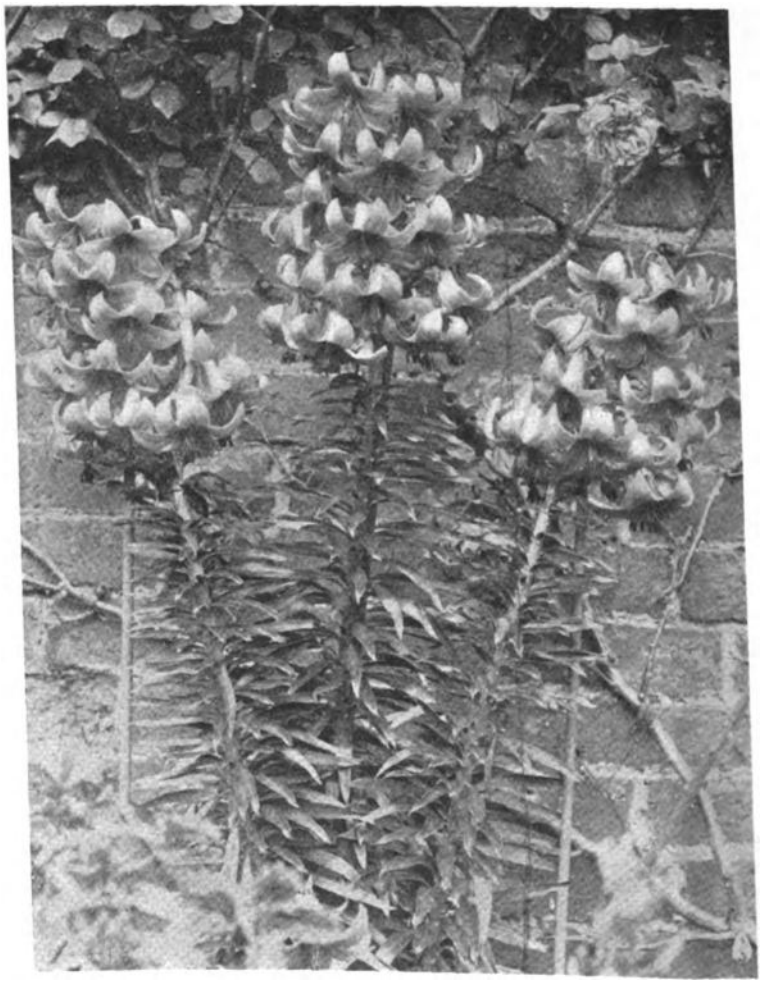
LILIES FOR EVERY GARDEN

MOST of us have at least a nodding acquaintance with the genus lilium; indeed the three old favourites, Lilium candidum, L. croceum and L. tigrinum are to be found in almost every district in the British Isles, growing under most varied conditions. Nine-tenths of the other species are equally as easy of cultivation, but always providing that they are given suitable positions. It must not be argued from this proviso that lilies are capricious. The rhododendron is not capricious because it hates lime, or the primrose because it loves shade; yet the poor lily, nauseated with rich feeding and scorched by "a position where it will get all the sun," is dismissed with the stigma of "not really hardy."

Lilies inhabit the waste places of the Northern Hemisphere, and flourish under conditions often so severe that their complete hardiness in our milder climate seems assured. Let us for a moment journey in thought with that intrepid explorer, Mr. E. H. Wilson, to the confines of mysterious Tibet, to the wild and mountainous hinterlands which separate China proper from the hierarchy of Lhassa. "There in narrow, semi-arid valleys, down which thunder torrents, and encompassed by mountains composed of mud shales and granites, whose peaks are clothed with snow eternal, the Regal Lily has its home. In summer the heat is terrific, in winter the cold is intense, and at all seasons these valleys are subject to sudden and violent windstorms, against which neither man nor beast can make headway. There, in June, by the wayside, in rock-crevices by the torrent's edge, and high up on the mountainside and precipice, this Lily in full bloom greets the weary wayfarer. Not in twos and threes, but in hundreds, in thousands, aye, in tens of thousands. Its slender stems, each from 2 to 4 feet tall, flexible and tense as steel, overtopping the coarse grass and scrub and crowned with one to several large funnel-shaped flowers more or less wine-coloured without, pure white and lustrous on the face, clear canary yellow within the tube and each stamen filament tipped with a golden anther. The air in the cool of the morning and in the evening is laden with delicious perfume exhaled from each bloom. For a brief season this lonely, semi-desert region is transformed by this Lily into a veritable fairyland." ("The Lilies of Eastern Asia," by E. H. Wilson). To try to imitate such conditions would be as futile as it is impossible, but L. regale and most of the other species flourish and increase with far less trouble than is often lavished by many garden lovers on less desirable plants.

On consideration of the most varied conditions under which lilies grow naturally all round the world, it is obviously absurd to lay down any hard and fast rule as to their cultivation in our own small part of the globe. Generally speaking, however, they succeed best in this country when surrounded by a fairly cool, moist atmosphere. Without exception lilies are always found growing among grasses or low shrubs. This teaches us that though they mostly require a certain amount of sun in which to develop their flowers, it is essential to break the direct rays of the sun on the roots and lower part of the stem. It may be taken as a general rule that all lilies revel in leaf soil and loathe raw animal manure, though regale, martagon (and its European allies), candidum and excelsum will also thrive over lime. All lilies, once well established, resent disturbance and should be left severely alone. Deep planting is another important point; those who have attempted the heart (and trowel) breaking disinterment of wilding bulbs firmly wedged about a foot down between rocks and roots of shrubs and trees, will appreciate this fact, and will plant their garden bulbs deeply.

The following lilies will flourish in any good garden soil of a fair depth, well dug and well drained:



LILIUM MONADELPHUM SZOVITZIANUM AS A WALL PLANT.

First and foremost comes L. REGALE, the finest of all garden lilies, ultimately reaching 6ft. or 7ft. under cultivation, with ten to twenty exquisite blooms on each stem.

L. HANSONI is a grand early species, not sufficiently known and grown, with fragrant nodding golden flowers.

L. DAVIDII, also known as Pseudo-tigrinum, is a comparatively new Chinese lily with a splendid constitution and flaring cinnabar-red flowers.

L. HENRYI, truly a "fool-proof" lily, bears so many huge orange-yellow blooms as to need support, but as a stake 6ft. or 8ft., or even 10ft. long is at all times unsightly, it is better to plant this almost aggressively luxuriant lily by some tall shrub, such as a rhododendron, to which it may hitch its tall arching stem by its wiry pedicels in a natural manner.

L. CANDIDUM (Madonna lily) has two forms, the broad petalled and the thin starry petalled; the former is infinitely superior. Bulbs of this lily should be planted just beneath the surface of the ground.

L. EXCELSUM (TESTACEUM) is a hybrid from candidum and it likes the same treatment. Its fine heads of delicate apricot or Nankeen yellow flowers are charming against a background of dark green foliage. Unfortunately, this lily has become scarce.

L. LONGIFLORUM, with its several forms, though perfectly hardy, has a sickening habit of splitting up its bulbs and deteriorating after it has flowered once. It is better under glass, where it is the universal *pièce de résistance* among lilies for forcing.

The common purple L. MARTAGON needs no comment. L. M. ALBUM is superb, with bold pyramidal spikes of glistening snowy flowers; while L. M. DALMATICUM is even stronger than the type, bearing up to fifty flowers, varying in colour from crimson lake to deep wine-red.

L. PYRENAICUM is the malodorous yellow Turk's Cap lily. Its coarse red form is too often sold in place of L. pomponium, a graceful slender mountain species with brilliant sealing-wax red flowers.

L. CHALCEDONICUM, the scarlet martagon, is a brilliantly coloured species well worth growing. L. c. MACULATUM is a

Digitized by Google

superior form, being deeper in colour, slightly spotted with black, and taller growing.

The tiger lilies are of special value, as they extend the lily season into September and October. The best form is L. TIGRINUM SPLENDENS, with bold black-spotted dark salmon-orange flowers; L. T. FORTUNEI GIGANTEUM is the latest form, and grows up to 5ft. or 6ft. high, with thirty or forty flowers of a rather lighter shade. L. T. FLORE PLENO is the only lily in which double flowers are admissible; perhaps not even that.

L. MONADELPHUM SZOVITZIANUM is not seen often enough in gardens. It bears from ten to thirty large black-spotted straw-yellow flowers, poised like so many pendulous bells from a graceful 4ft. stem. A strong grower and a decided acquisition to any garden.

The many hybrid varieties of LL. UMBELLATUM and ELEGANS, though without the proverbial grace of the lily in so far as growth and habit are concerned, bear magnificent flowers like large upright chalices, and provide us with some of the finest orange, crimson and red shades we possess. Like their European cousin L. croceum, they grow almost anywhere, and are to be found doing well even in the heart of London.

A WELL-FLOWERED COLONY OF THE SCARLET LILIUM CHALCEDONICUM.

LL. PARDALINUM and SUPERBUM are two North American swamp lilies which are quite amenable to ordinary garden cultivation. Both grow from 5ft. to 6ft. in height, with quantities of orange flowers deeply spotted and blotched with crimson.

All the lilies so far mentioned will succeed in any ordinary border under conditions inferior to those already described as essential for perfect cultivation. The following lilies require a certain amount of partial shade and coolness at the root, and are most suitable for planting among low-growing shrubs or herbaceous plants.

L. AURATUM, the golden rayed lily of Japan, is universally considered the most magnificent of all lilies, its huge stately flowers of white and gold with their powerful fragrance inspiring many attempts at cultivation which too often merely result in correspondence in the gardening press. The chief cause of failure with this and the following species is inadequate drainage. This may be easily remedied by an artificial strata, 6ins. to 9ins. thick, of broken bricks or stones, about 2ft. below the surface of the ground. Plenty of sandy leaf mould around the bulb will encourage the maximum growth, which must not be allowed to suffer from lack of that moisture which in their native home is supplied by the heavy morning dews. This suggests a judicious use of the watering can.

The sturdiest variety of L. auratum is PLATYPHYLLUM. Though not growing quite so tall as the type, its flowers are larger, often exceeding 12ins. in width. By far the finest of the late-flowering lilies.

L. SPECIOSUM ranks with auratum as one of the most popular lilies, succeeding admirably in the open border. Among the most beautiful Japanese forms are L. S. ALBUM KRAETZERI, very fine white flowers banded with green, and L. S. MAGNIFICUM, with massive ruby carmine flowers margined with white.

L. BROWNII is perhaps the finest of the trumpet lilies, but at present is too expensive to be popular.

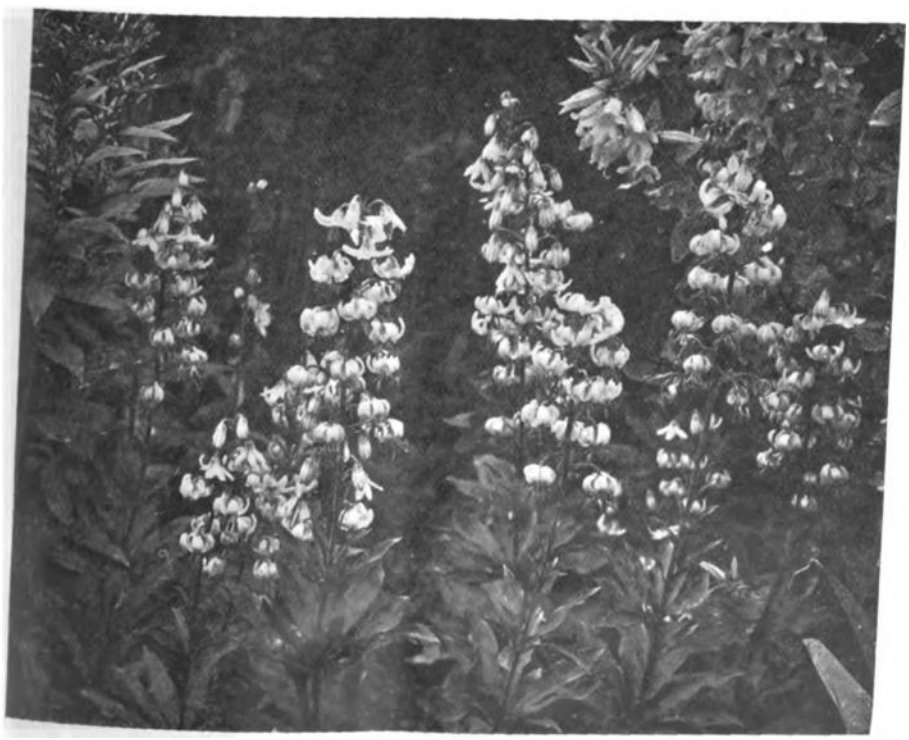
L. PHILIPPINENSE FORMOSANUM is a hardy alpine form of the sub-tropical L. philippinense, its long almost tubular trumpet flowers held rigidly horizontal on 3ft. stems, give it a distinction possessed by no other lily.

L. JAPONICUM (KRAMERI) is the most delicately beautiful of all. The flowers have the form, though not the size, of auratum, and are coloured a clear soft rosy pink, occasionally varying to white. Though not gifted with a first-class constitution, it succeeds admirably in a well drained shady spot.

L. WALLACEI likes a moist position, and bears most pleasing rosy apricot erect cups, increasing rapidly.

L. RUBELLUM is the daintiest flower imaginable. An alpine woodland lily, it is hardy at the foot of a large shrub or among low trees. A cheerful little plant, with pure rose pink trumpets on 2ft. stems.

L. WILLMOTTIÆ is a very graceful and attractive Chinese lily. Its 3ft. stem is often too slender to support the heavy pyramidal inflorescence of twelve to twenty vivid orange red flowers. Nevertheless it is one of the finest and loveliest of the genus.



ONE OF THE MOST GRACEFUL OF LILIES, L. MARTAGON ALBUM.

Digitized by Google

Those who are so fortunate as to possess a wood can grow the grand L. GIGANTEUM to perfection. This, the most majestic of all lilies, delights in a rich deep vegetable soil, protected from wind and sun. A group in flower, with ten to twenty heavily perfumed white trumpets on each 10ft. stem, is a joy for ever.

L. CANADENSE and L. GRAYII are swamp lilies from North America, establishing themselves rapidly by the edge of pond or stream. Both have orange-yellow flowers spotted with crimson, Grayii being the more deeply blotched.

None of the lilies mentioned in these rough notes presents any difficulty under cultivation, if a little commonsense and attention is given to placing them in the positions where they will feel at home. Once more I will repeat the three essential requisites: Deep planting, perfect drainage and unlimited leaf soil.

R. G. WALTER.

CORRESPONDENCE

A MECONOPSIS HYBRID?

SIR,—I enclose an illustration of a meconopsis growing in my garden in Perthshire. This is one of two plants which came out of the seed pan of Meconopsis simplicifolia, Bailey's form. It flowered last summer along with the plants of M. simplicifolia. These died after flowering, but the meconopsis shown flowered this summer again.

The flowers were pale yellow and had only one flower on each stem, which springs up from the root, not like M. integrifolia, which has a number of flowers on the stem. The leaves are similar to M. simplicifolia. The plant did not set seed last summer, but has done so this year—it has every appearance of growing on and flowering next year again. This meconopsis may be a cross between M. integrifolia and M. simplicifolia, as it was raised from seed from plants of M. simplicifolia growing near to M. integrifolia, but as both of these species are biennial I cannot account for this plant flowering two years in succession and not dying. The seed capsule is covered with golden brown hairs somewhat resembling the capsule of M. integrifolia, but the style is quite different from that species, being long and of the same shape as that of M. simplicifolia.

I also enclose a photograph of M. Wallichii with pure white flowers. In growing this species I usually get a few plants with white flowers which bloom at the same time as the blue flowering plants, but the curious thing about this plant is that it came into flower three weeks before the other plants of Wallichii raised from seed and planted out at the same time.—A. HARLEY, *Kirkcaldy*.

THE PROTECTION OF WILD FLOWERS.

SIR,—The Editorial appeal and the suggestions of Colonel Cuthbert James, in your issue of July 31st, respecting the above subject must have caused all lovers of the native flora to think seriously, and it is to be hoped that many useful suggestions will be forthcoming.

The proposed legislation seems to deal effectively with one group of offenders, namely, the gipsy hawkers of wild flowers, but I am inclined to think that there is a greater source of danger to our wild flowers from over-enthusiastic amateur collectors. Week by week classes of students in many parts of the country are taken on rambles where wild flowers abound and, even though botany may be one of the least important subjects in their curriculum, these students are encouraged to collect specimens irrespective of the rarity or otherwise of the plants. These collected specimens are pressed and dried and, finally, stuck on sheets of stiff paper. This task completed, what has been gained?

True, the botanical features are retained, but often to all outward appearance the mounted specimens are unrecognisable, and after a year or two may be quite useless for purposes of comparison.

Therefore, I would say: that indiscriminate collecting be discouraged and as an alternative suggest that charts of drawings be used in the classrooms, which would illustrate the less known plants. That the students, having been introduced, by these charts, to such plants as are likely to be found in the vicinity, may be taken on a ramble and encouraged to take notes on the wild flowers seen. That after each ramble, or after a series of rambles, an examination be held, and that a student's knowledge of wild flowers be based on his ability to write an essay on the plant associations noted on the aforementioned rambles, rather than by the presentation of three or four hundred mutilated dried specimens.

There is much to commend Colonel Cuthbert James's suggestion that a society be formed to protect and propagate the rarer local native plants and the question naturally arises, "Exactly how shall such a society set about its duties?" Could not enthusiasm be aroused by the growing of collections of native plants in many of the public parks? It might work in this manner: that in one park in a town an area be set aside for the cultivation of native plants; that the members of such a society as suggested by Colonel Cuthbert James collect plants and send them to the Superintendent of the nearest park, together with such data respecting the soil and situation as may be deemed important: and that if successful in propagating to any extent, the Superintendents of the parks will give to the members of the society certain plants which they may wish to use for the replanting of ransacked areas.

Of course some parks have already established a collection of native plants and perhaps the idea could be more generally adopted, for it has many good points. For example, classes of students could see the living plants, which are far more instructive than dried specimens, and, furthermore, as such collections would be made up, for the greater part, of plants found in the locality, the atmospheric conditions would be favourable to the establishment of such plants.—W. HOWELL, *Garston, Herts*.

A SUPPOSED HYBRID MECONOPSIS.

A PURE WHITE FORM OF M. WALLICHII.

THE AUSTRALIAN "WATTLE."

SIR,—In a paragraph in THE GARDEN, April 17th, 1926, reference was made to the term "wattle," used instead of mimosa in Australia. As the reason for making use of "Wattle" is somewhat peculiar, it may perhaps be interesting to readers of THE GARDEN if I explain.

When the first settlers, numbering upwards of 1,000, arrived at Port Jackson, New South Wales, in the year 1788, they were obliged to make every effort possible to provide themselves with dwellings of some sort. They found the large predominating trees, eucalypts, extremely difficult to cut down and split or saw up for house-building. However, a species or two of casuarina, supposed to be a pine, which were somewhat plentiful, was easier to work and so also was the cabbage-tree palm, Livistona australis, but it was found easier and quicker to construct the walls of houses of "wattle and daub" than of timber. For this purpose the slender, very flexible, branches of a small tree which was found in abundance growing among sandstone rocks —Callicoma serratifolia—were interwoven together and on to a framework of this, stiff puddled-up mud was spread and smoothed over.

Some time afterwards, the small branches and seedlings of Acacia decurrens were used, probably because the callicoma had become scarce, and as bush and grass fires occurred

Digitized by Google

seedlings of this acacia grew up in hundreds close together, the fires having cracked the hard seeds, giving them a chance to grow. Thus it came about that this species of acacia was known as "wattle." In course of time other acacias were known as wattle by the humblest class of inhabitants, until it was adopted generally, although the name is really an absurd one. For many years, however, acacias were generally known as mimosas, with the exception of A. decurrens. This species, which under its natural conditions attains a height of 40ft. to 50ft., with a diameter of about 6ins., exudes quantities of gum, somewhat similar to gum arabic and much sought after by children.

The wattle has now become the national flower of Australia, which to many persons acquainted with Australian indigenous plants, is a mistake, especially as the common name is a ridiculous one.—WALTER S. CAMPBELL, *Sydney, New South Wales.*

"GARDENING WITHOUT A GARDEN."

SIR,—Many of us who have had to live in London have experienced attacks of garden-hunger similar to that from which "E. H. M. C." is suffering. The incubation period of this complaint is of varying duration, but a climax inevitably occurs when the sufferer must "grow something."

Cacti and succulents are all very well, but by their aloofness and inhumanity they leave one cold. Mere existence is not everything.

During our own exile, we made many experiments, and found that miniature trees throve well and made the greatest appeal to our interest and imagination. Beeches, horse chestnuts, Scots pines and mountain ash all did very well.

The little trees should be sought just before they come into leaf. They must be very carefully uprooted so that the roots are not broken; very coarse or overlong roots can be shortened, but they must be clean cut.

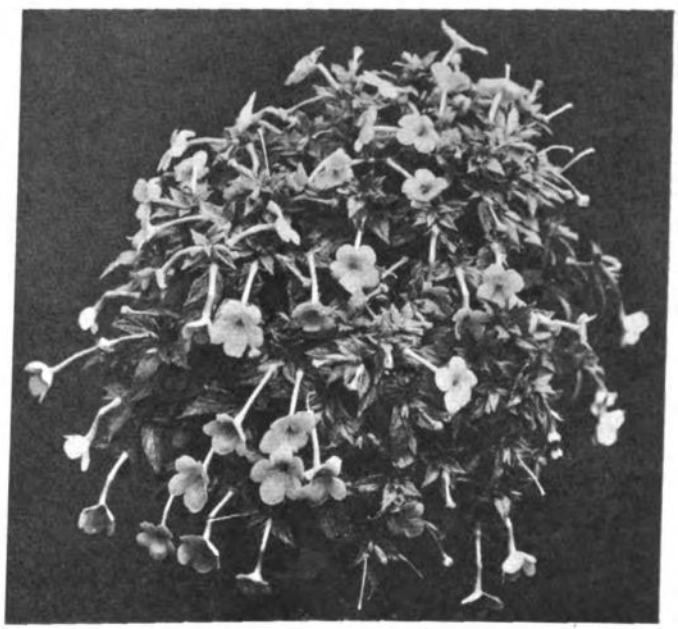
Special care should be taken to select the little trees most characteristic in growth of the full-grown type. They should be as "grown-up" looking as possible. The baby beeches must have the thickest, smoothest "trunks" possible, with a noble spread of branches; the Scots pines should appear windswept and carry a film of lichen, as they often do in their young stages. None of the trees should be more than 8ins. high, as many as possible should be less. The bowls we used were glazed, and were not more than 3ins. and 4ins. deep. A generous supply of pebbles was placed at the bottom of the bowls, and a compost consisting of half light sandy loam and half leaf mould, was used. Care was taken to spread the roots of the trees as naturally as possible and two or more trees were planted in each of the bowls, which ranged from 7ins. up to 12ins. in diameter. Having the trees in position, "features" were added to the miniature landscapes; a dry watercourse, marked with tiny flint chippings and a bridge; a mossy boulder; a hill or a valley; a meadow, formed of that pernicious weed—spurry—which appears to tolerate constant "mowing" (with nail scissors), with perfect equanimity; shrubs, represented by the tiny tufts of young heather. Lichen-covered twigs lay below the most rugged trees to represent fallen boughs.

We never had a single casualty among the trees. Their growth was almost imperceptible, but they formed leaf buds, came into leaf, took on autumn tints and cast their leaf with the utmost regularity, year after year. Their spring was slightly later, their autumn slightly earlier than those of their kind grown under natural conditions. As time went on they adjusted themselves to a very great extent to the size of their surroundings. The beech leaves became much smaller and more numerous, the "hands" of the horse chestnuts were about an inch long, but perfectly proportioned, the needles of the fir trees were only an inch long; this was after they had seen two springs in the bowls.

If we had to leave them unattended for several days the bowls would be stood around a bucket of water and kept moist by capillary attraction by means of woollen threads. For over three years these miniature trees were a source of continuous interest and pleasure to us, but never so much as when we saw the miracle of spring unfolding on a fairylike scale before our enchanted eyes. After one of the beech trees had spent four years in London, in a bowl, 7ins. in diameter and 4ins. deep—with one change of soil and one root pruning during that period—we planted it in the Surrey garden, which suddenly materialised for us out of the blue. It made no growth for about eighteen months, but is now growing rapidly. The trunk promises to be permanently somewhat short in proportion to the spread of the boughs.—GWENDOLYN ANLEY, *Woking.*

LATE SUMMER FLOWERS AT WESTMINSTER

RARELY would it seem that our fruit growers take advantage of the special shows that are set aside for them to display their wares, judging from the few exhibits, numbering four on the present occasion, which were shown at the Royal Horticultural Society's fortnightly meeting on August 10th. This show was really a fortnight in advance according to the R.H.S. list and the main features of interest, instead of being peaches, nectarines and apricots, were gladioli, phloxes and plums. The gladioli were present in considerable numbers and the exhibits certainly augur well for the future of this first-class garden flower. For brilliance and shading of colour and elegance of habit, and length of its flowering period, there are, indeed, few flowers to rank as its equal. Again, the value of the phlox as a high grade subject for the herbaceous border was amply illustrated by the exhibit of Mr. H. J. Jones and several others staged by the Hon. Vicary Gibbs and other exhibitors. The improvement in habit of growth, size of flower and, above all, in gradation of colour, has almost, we should imagine, reached its maximum. A few years back, such shades and tones as we are at present witnessing would not have been thought possible and the phlox serves as still another example of what may be accomplished by continued selection and careful crossing, in one race of plants. A few flowering shrubs were also on view, but their beauty was rather dimmed by the brilliant colourings of the herbaceous flowers alongside.



ACHIMENES DWARF PINK, A MOST DECORATIVE PLANT FOR THE COOL GREENHOUSE.

In nearly every fruit-growing district the present season has proved an excellent one for plums, while in most cases apple crops are poor. Messrs. G. Bunyard staged admirably grown plum trees in pots, thus enabling the visitor to judge of the habit of the varieties and to a certain extent of their fruitfulness. The trees were clean, healthy and vigorous, and on some of the varieties, such as Diamond, the fruit was particularly fine in size and colour. President was another culinary plum bearing well. Jefferson Gage, Early Transparent Gage and Prosperity bore large fruits but smaller crops.

Lane's Nurseries, Limited, had a conspicuous group of two year old vines growing in pots, each specimen carrying six or eight well shaped bunches. Their two best varieties were Black Alicante and Black Hamburgh. Peaches and nectarines of enormous size and in perfect condition were exhibited by the Right Hon. Lord Leconfield. The varieties Peregrine, Dymond and Dr. Hogg were brilliant in colour. A number of good culinary and dessert apples were seen among a collection of fruit shown by Messrs. Spooner and Sons.

Gladioli formed the chief floral groups. A wide range of delightful colourings was displayed by Messrs. Kelway and Son, and the spikes were exceptionally large. Large-flowered and primulinus types were shown as well as a number of this firm's noted Langprim hybrids. Among the large-flowering varieties Kelway's Masterpiece, A. E. R. Gilligan, Brooklands, Christine, Margaret Kelway and the delightfully rosy pink gladiolus Sunset, which is streaked and splashed with slaty violet, were outstanding. Rev. J. Stubbs, the brightest of all the Langprim hybrids, Crimson King and Favour were other fine varieties on show.

A magnificent collection of gladioli was shown by Messrs. R. H. Bath, Limited, and many of the newer introductions were exhibited. Red Emperor, Frau Dr. Hauff and Sheila made brilliant splashes of colour. Gipsy Queen, Rose Ash, Energy, Thomas Edison, Isis, Xanthia, and Joe Coleman were of all-round merit.

Gladioli were also shown by Messrs. H. Langridge and Mr. Alfred Edwards. The former exhibited varieties of such as

Digitized by Google

Mrs. Frank Pendleton, Odin, Golden West and Brilliant of the large-flowered type, together with Souvenir and Psyche among the primulinus hybrids. Graceful spikes of gladioli belonging to the primulinus section formed the exhibit of Mr. A. Edwards. Varieties of the most artistic shades had been selected, a few examples of which are Topsy, Niobe, Daphne and Hermione.

Roses, carnations and hardy flowers were shown by several of the leading firms. Mr. B. Ladhams showed among a general collection of herbaceous flowers a number of his hardy perennial lobelias, which are not only beautiful but most valuable border plants. Hamwood Pink, Mauve Queen and Purple Emperor were three fine varieties. New sidalceas and dahlias were staged by Mr. H. Hemsley. Mr. M. Prichard included several exceedingly fine montbretias in his group of hardy flowers. Lilium tigrinum japonicum, Eryngium planum, Campanula Tymondsi and Armeria Bees' Ruby were all in good form on this stand. A number of plants which deserve greater popularity were exhibited by Mr. G. Reuthe. Catananche cærulea, Stokesia cyanea with its large decorative blue flowers and Bocconia microcarpa with its fine foliage were noted. Dahlias of all types were exhibited by Messrs. J. Cheal, and aquatics and bog plants by Mr. Amos Perry.

One of the features of the meeting was the superb exhibit of orchids from the garden of Baron Bruno Schröder, The Dell Park, Englefield Green, Surrey, which gained a gold medal, accompanied by a silver-gilt Lindley medal to Mr. J. E. Shill in recognition of his skilful cultivation. The group contained over a hundred specimen plants of Cattleya Hardyana, bearing upwards of 500 flowers, all with white sepals and petals and a bright purple lip. Some of the plants had three spikes of bloom, and there were several instances of six flowers on a spike. The central area was filled with numerous well flowered plants of Cattleya Harold (Warscewiczii × Gaskelliana), while in front were some of the new yellow coloured hybrids. Arranged at intervals were four grand specimens of Cypripedium Maudiæ, each with about thirty flowers, proving the suitability of the fibre and moss compost.

Messrs. Sanders staged a group composed principally of summer-flowering species, including Lycaste Deppei, L. leucantha and Epidendrum Brassavolæ, brownish-yellow, the white lip tipped with purple. Dendrobium Victoriæ Reginæ, with flowers of slate blue colour, and D. regium, rose purple, came in for appreciation, as also did a well flowered example of Aerides falcatum. An interesting hybrid was seen in Spathoglottis edinensis (Fortunei × pulchra), raised in the Botanic Garden, Edinburgh.

Messrs. Stuart Low and Co had a select lot of attractive hybrids, including the singular Cattleya Suavior var. Aquinii, with peloric-like markings of purple on the tips of the petals; an unusually dark variety of Cattleya Hardyana; Lælio-Cattleya Ortega var. Ruby, of ruby crimson colour throughout; Odontoglossum Alcimeda, flowering out of season; and the prettily marked Odontioda Joan.

Mr. W. van Deventer, The Hague, Holland, sent a cut spike of Vanda Marguerite Maron, which the Committee considered was a very much finer variety than the original hybrid of this name.

NEW AND RARE PLANTS.

AWARDS OF MERIT.

CUPRESSUS TAMARICIFOLIA TILGATE VARIETY.—As its specific name implies the foliage of this dwarf form of cypress is rather graceful and feathery in character. The scale-like leaves are all more or less flattened in the one plane, giving a frond-like effect. In colour they are of a light glaucous green. It is a dwarf grower, reaching some 2ft. and of rather elegant habit if allowed to grow freely, spreading over a flattish rock in the rock garden or planted in a group in a bed or on a grass slope, where its branches fall over gracefully, giving a raised bed of foliage. Shown by Mr. Hemsley, Crawley.

SATYRIUM AUREUM.—An interesting representative of this genus of terrestrial orchids carrying dense spikes of medium sized light orange yellow flowers. On the reverse the flowers show a deeper orange than the interior. The leaves are few and many occur at the base of the stem. It is a form which is adapted for cultivation in a warm greenhouse. Shown by Mr. Amos Perry, Enfield.

ACHIMENES DWARF PINK.—A most attractive and decorative garden form of this genus of the gesnerads, which of late years has been much improved by continued hybridisation. The flowers are long and tubular and of a rich deep pink shade, which contrasts most effectively with the neat light green toothed and hairy leaves. It is a variety which should prove extremely handsome in a cool greenhouse in late summer, unlike many others which bloom earlier on. Shown by Messrs. Sutton and Sons, Reading.

SPHÆRALCEA FENDLERI HASCOMBE ORANGE.—An interesting form of this sub-shrubby perennial, bearing more cup-shaped flowers than that of the type. The flowers are of an attractive orange tone which stands out well from the greyish green foliage. Shown by Mr. C. T. Musgrave, Godalming.

GLADIOLUS KELWAY'S DEFIANCE.—A strong growing large flowered variety bearing well flowered spikes, having flowers some 4ins. across. The petals are of considerable substance and of a rich scarlet in colour with veining and shading in the lower petal. It is a variety which should look extremely well either in the border in the garden or in a vase in the house. Shown by Messrs. Kelways, Langport.

PHLOX VICARY'S VICTORY.—A variety carrying medium sized trusses of large deep pink flowers and a lighter eye. It is a good bright colour and should be most effective in a clump in the garden border.

PHLOX MRS. EDWIN BECKETT.—The flowers of this variety are of a delicate pink, showing a narrow deeper veining with a conspicuous darker eye.

PHLOX HON. MILDRED GIBBS.—The flowers are of an attractive mauve to violet shade, shading to white in the centre. It is of a shade which is rather inclined to change in bright sunshine.

PHLOX ENCHANTMENT.—A variety which ought to become popular, with flowers of a delicate rich cream pink, with a much deeper crimson eye, giving the flower some character. It represents quite a new break in colour.

PHLOX ANNIE LAURIE.—The flowers are of a delicate salmon pink and are large in size with overlapping shell-like petals. A deep mauve pink eye is most attractive.

All these phloxes were shown by the Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House Gardens, Elstree.

GARDEN TECHNIQUE

A BUSH OF MIGNONETTE.

AN interesting plant for the cool greenhouse or room garden is the bush of mignonette. As is well known, mignonette (Reseda odorata), although commonly grown as an annual, will really develop on the lines of a shrub. In such a state the bush flowers profusely for the greater part of the year providing it is shielded from anything like severe frost. The manner in which a bush of mignonette is secured is simple enough. In August select a strong-growing plant in the border, choosing one that has grown in a shapely manner. Pinch away all the flowers and also carefully remove any seed vessels. After this let the plant alone for a few days and then carefully pot up in light soil. If the weather is very dry, soak the soil round the plant a few hours before lifting. It is important to carry out the removal with as little root disturbance as possible. When potting arrange plenty of drainage and press the soil down firmly.

For a few days keep the plant in a cool, shady position and water as required. With ordinary care the mignonette should not suffer from the removal, and the plant will soon settle down into its new quarters. Now remove to a light sunny position. If plenty of water is given, the specimen may be left out of doors in the full sunshine right to the end of the summer season. For a time any attempts to flower should be checked, and this will encourage the formation of a bushy growth. Eventually the mignonette will develop on the lines of a little shrub with a woody stem. From this plant flowers can be picked all through the winter, and the following season there will be a wonderful profusion of bloom. To retain the bushy habit seed setting must be prevented and the dead flowers should be regularly removed.

A bush of mignonette may be grown directly from seed with a small amount of trouble. Here a few seeds are scattered in a pot of soil. At this season of the year the little plants will come up quickly and, when these have developed, all but the most sturdy should be removed. These are grown on and, until the following spring, any tendency to develop flowers should be checked. Pinch out any straggling shoots in order to secure a shapely plant that will look like a neat shrub.—S. LEONARD BASTIN.

BROMPTON AND OTHER STOCKS.

Raising from Seed.

IN the midland and southern counties I have never found it difficult to grow Brompton, East Lothian, Empress Elizabeth, Beauty of Nice and similar stocks in quite open quarters; nor in the northern counties where a little protection was afforded from north and east winds. The protection must not be such as to cause the young plants to be drawn up weakly. Two 9in. boards on edge placed between every third or fourth row will be sufficient, or a cold frame from which the lights can be entirely removed during open weather. It is a mistake to raise seedlings too early. I find the end of July a good time in northern and the middle of August equally suitable in southern counties. Instead of sowing the seeds in the open border, do so in boxes or in beds in cold frames. Provide good sound drainage, as the young plants soon turn yellow if the soil does not dry up in a normal way. Beware of wireworms; hand-pick the loam used if it comes recently from an old pasture or upland. Do not be tempted to use spent soil from pots or boxes, especially from boxes which are covered with fungus inside. Even treatment with fungoid killers may not be very successful. Good fibrous loam two parts, sweet leaf-soil one part and old mortar rubble one part will form an ideal compost. Sow the seeds thinly on a watered surface, cover lightly and water carefully at all times. Be sure you transplant when the seedlings are tiny and always select those possessing small, rounded seed leaves, as such generally denote double flowers and very strong plants single flowers.—G. G.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque ..	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty ..	Pale rose and deep red.
Lohengrin ..	Cattleya mauve.
Mdm. Chereau ..	White, frilled azure blue.
Mrs. H. Darwin ..	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme ..	Pure blue and blue purple.
Prosper Laugier ..	Bronzy cinnamon and velvety crimson.
Rhein Nixe ..	White and violet purple.

One plant each of the 12 varieties, **7/6** post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

SCHIZANTHUS.

How to Raise and Grow Fine Plants.

THIS is a half-hardy annual, and should be treated as such from the seedling to the flowering stage. It is an easy plant to grow, and on this account, perhaps, its early culture was not attended with the success that the beauty of the plant deserved. During recent years the strains have been greatly improved, and we now possess some very beautiful ones, the richness of the flowers fully warranting them being called butterfly flowers. The present is a suitable time for seed sowing. Sow the seed in a shallow pan well drained and filled with a compost of fibrous loam, leaf-soil and coarse sand or old mortar rubble reduced to a fine powder, then it can be evenly mixed with the soil. Level the soil in the pan, then water it and sow the seeds evenly about one hour afterwards, cover them lightly with fine soil, but do not water afterwards. Simply place a square of glass and some brown paper on the pan, keeping the latter in a frame or on a shelf in a greenhouse until the seeds have germinated. Then gradually expose the seedlings to the full light and admit plenty of air. The first transplanting should be done into small pots, one seedling in each pot, so that there will not be any disturbance of the roots when the plants are repotted. Use a similar compost throughout, only in a rougher condition at the final potting. One plant in a pot is sufficient, some in 6in. and the strongest specimens in 7in. pots. Always pot firmly after the first potting. The right time to feed is when the pots are filling with roots and flower-buds are forming. These plants like plenty of light and air. They do remarkably well during the winter months on a sunny shelf in a greenhouse.—GEORGE GARNER.

WINTER GREENS.

THE way to succeed with winter greens is to have a deep rooting medium—that is, soil trenched or broken up to a good depth, not less than 18ins., and then moderately firmed while the ground is fairly dry; to get sturdy plants established before the month of December; and to grow the best strains. The best cannot be had from a shallow, poor soil. If soil is prepared in July and August after peas or potatoes have been cleared away, it will become quite firm enough before real frosty weather sets in. Where the position is partly shaded the cultivator is somewhat handicapped, as the plants get overdrawn, leggy and sappy. To help plants in such cases do not plant them as closely as those in a quite open part of the garden, and grow more kale, Brussels sprouts and sprouting broccoli in the shaded plots than cabbages and broccoli—those that will form leaves and shoots rather than those that are to form hearts. If the garden is situated in a valley or near rivers or large sheets of water, frost will do more harm than to plants grown on higher ground, so it is advisable to leave sufficient space between the rows to allow earthing up of stems in good time, as the frost always injures the stems just below the main leaves first.—G. G.

EARLY-FLOWERING HYACINTHS.

AS soon as bulbs can be obtained in August or September they may be potted up or put in boxes thickly, the compost consisting of any good porous mixture containing loam, leaf-soil and sand. They are then put into any suitable plunging material for at least six weeks, or until they fill the soil with roots; this will be indicated by vigorous top growth. After that they are taken to a frost-proof frame and, finally, inside the greenhouse. A brisk bottom heat when the buds show will bring them into flower early in December if need be. The elegant, graceful flowers are thus easily obtained in plenty by Christmas-time.

The common variety grown is the Single White, a sweetly scented flower beloved by all. The pink sort is less frequently grown, and is not so fine a flower; the blue also can be had, but it is scarcely worth growing. Italian hyacinths are even better than the Roman, but it is difficult getting them in time for the festive season: however, some should be grown, if only to prolong the season of these delightful flowers. Specially prepared Dutch Romans (what a name?) are being strongly pushed on the market nowadays. There is no difficulty in having them, too, in flower by Christmas, but many do not care for them as they do for the true Romans.—LANARKSHIRE.

CYCLAMEN.

Cultural Notes.

CORMS that have been rested for a time in pots should now receive a thorough watering if it has not already been applied. Place the pots upright outside or in a cold frame for this purpose. Directly the new growth seems to be free and before the new roots are very long shake away the old soil carefully from them and repot the plants in smaller pots. Use a compost of good mellow loam two-thirds, sweet leaf-soil one-third and very coarse sand to ensure the free passage of water. Provide good drainage and clean pots. Place the coarser portion of the compost in the bottom of the pot and finish the work of potting by having the top of the corm clear of the surface of the soil and nearly 1in. space to hold water.

The daily treatment of the plants should be even, that is, they should be placed on a bed of ashes, these being damped in dry weather, the frame ventilated to maintain an even temperature and the plants also watered carefully. For about two weeks after the plants are potted the frame should be kept closed or nearly so and the glass lightly shaded when the sun shines, then gradually ventilate freely. It will then be time to make a sowing of seeds in a pan in a similar compost. Drop the seeds singly about half an inch apart and cover them almost that depth. A suitable position for the seed pan is a shelf near the roof glass where the resultant seedlings will get plenty of light without being exposed to the direct rays of the sun.—HANTS.

HARDY ANNUALS.

Sowing for Early Flowering.

MANY generations ago the kinds and varieties of annuals were very few and the plants were grown in odd corners, often at the ends of rows of potatoes or in batches in the border by the side of the flagged path. To-day we grow them by the hundred thousand in every district and, with no less keen interest, smaller numbers in restricted town gardens.

Most of us know that the most popular annual, the sweet pea, flowers best and longest when the seeds are sown in the autumn, Nigella Miss Jekyll, candytuft, calendula, Clarkia elegans, godetias, annual larkspur, poppy, lupin and several others may be raised from seeds sown in an open but sheltered border—sheltered from north and east winds. Raised in this way, cornflowers will be available for cut flowers at an early date. It is a mistake to try to grow annuals well in a shallow soil; the plants thrive best in a deeply dug or actually trenched soil, and one that is fairly rich. Autumn trenching should always be the rule, too, for all the spring-sown annuals. Prepare some nice sifted soil for placing in the seed drills and also for covering the seeds. Guard against slugs, and be sure there is no overcrowding. Thin out according to the size of the foliage.

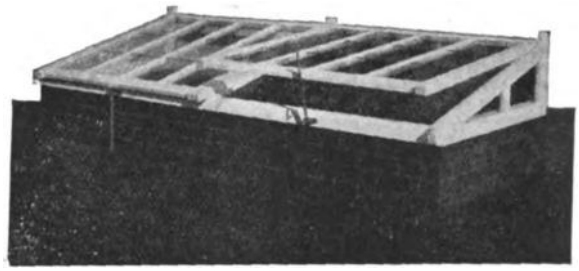
ON GLASSHOUSES

THE glasshouse is such an important adjunct to the average establishment that the selection of the most suitable type for any particular purpose or position is a subject worthy of considerable thought and attention. Rightly planned and placed, the greenhouse, if worked in conjunction with cold frames and the general garden, will provide not only many opportunities for interesting horticultural study, but also a medium by which many varieties of fruit, flowers and vegetables can be obtained in all seasons; while a well designed conservatory or winter garden is an architectural feature which will give a distinctive appearance to any residence. The object of this article is to help the uninitiated in the matter of selection of a suitable structure. Broadly speaking, ordinary greenhouses may be divided into two distinct types, the span-roof and the lean-to roof. For general purposes the former type is, perhaps, more satisfactory, and it should be built in an open spot. If possible it should run from north to south in order that each side will obtain the maximum amount of sunlight in the morning and afternoon respectively. If space is a consideration, however, and there exists a convenient wall against which a lean-to house can be built, then its services can be very well utilised and, as the wall will form a ready-made back, a considerable saving in initial cost can be effected. It will usually be found that plants grown in a house of this description are apt to grow over, away from the back wall, it being their natural inclination to face the light. In the case of pot plants this will necessitate the continual turning of the pots if well shaped and evenly balanced plants are desired. This is a fault which is not noticed in a span-roof house, for here the light will be found to be practically equal from all angles of the house. Another important point in favour of the span-roof type is the fact that it lends itself to more even ventilation than does the lean-to structure; while by the judicious use of blinds or shades it is possible at all times to protect tender plants or seedlings from the glare of the sun without altogether shutting them off from the daylight. The lean-to is, perhaps, more suited for growing vines, wall fruits, climbing roses, etc., and if in summer it becomes too hot for flowers, an ideal crop will be found in the tomato. The ventilation of all houses is an item of paramount importance, and provision should be made for hinged lights at regular intervals in both sides and roof. It is preferable that the ventilators in the roof should not come immediately in line over those in the sides in order that a more even flow of air can be obtained over the whole of the house if desired. While it is possible to arrange for all these ventilators to work from one crank, it is preferable that they should work independently of one another in order that the flow of cool air can be regulated in any part of the house should strong, damaging winds arise. The actual construction is undoubtedly the most important feature of all, for it is upon this that the longevity of the house and the success of the cultivation therein will depend. The building of a glasshouse is a task beyond the powers of the average handyman and, while the local joiner can occasionally be trusted with minor repairs, he seldom possesses either the up-to-date plant or the wide experience which is necessary to produce the ideal house. Only expert knowledge and long experience can successfully deal with the problems of greenhouse construction. The foundations, wood and other materials used, method of glazing, ventilation, heating, etc., are all of vital importance in a building which suffers so much from change of temperature and exposure, and is so largely composed of glass. Unless constructed on the right lines, the building is bound to become a constant source of trouble and expense. In this respect it is far better to deal with a reliable firm which specialises in this particular subject and which is content to stake its reputation on the quality of its products. Any well known firm is always glad to send any interested enquirer illustrated catalogues and specifications of really good class houses to suit all purposes, and is also prepared to submit advice, designs and quotations for the larger and more elaborate conservatory or winter garden. The patent metallic frame glasshouses are familiar to most visitors to the large shows and, while they are a little more expensive in initial cost, they repay for the increased outlay in that they are practically indestructible once they are erected, providing they are regularly painted and kept in good condition, and, what is of still more importance, they ensure a greater amount of light reaching the plants. At the recent Chelsea Show several specimen metal houses were on view, and the construction certainly left little to be desired in the matter of durability or appearance.



A MODEL FRAME FOR THE AMATEUR GARDENER.

Having acquired his glasshouse, it behoves the owner to exercise a little thought and care on its upkeep. A periodical survey should be made occasionally and a watchful eye kept on the condition of the framework. If the outside of the structure is painted every three years and the inside every five years, the woodwork should keep in excellent condition for an indefinite time, but once the water is allowed to enter decay is bound to follow sooner or later. Carson's "Vitrolite" is a paint specially manufactured for conservatory and greenhouse work, and it can be strongly recommended for this purpose.

A. J. C.

A "TENANT'S FIXTURE" GREENHOUSE SUITABLE FOR A SMALL GARDEN.

PUBLICATIONS RECEIVED.

"Hampton Court Gardens, Old and New," by Ernest Law. (Messrs. Geo. Bell and Son, Limited, price 3s. 6d.). An interesting descriptive survey, together with a historical and horticultural account of these royal gardens. The full layout of the garden is described, and detailed schemes are given of all the bedding and border arrangements in the gardens, so that to the keen visitor it will form a guide to the gardens of inestimable value. Apart altogether from its value as a guide, the amateur gardener will find it extremely useful as an aid in selecting certain varieties of plants for seasonal exhibition in his own garden. It is a little book well worth possessing.

"The Journal of the Edinburgh Royal Botanic Garden Guild," Vol I, Part II. All former members of the staff of the Royal Botanic Garden, Edinburgh, will be pleased to see the reappearance of this Journal.

Digitized by Google

the first number of which was published in 1914, and it is to be hoped that the energy and enthusiasm of the present Committee of the Guild who have made its re-publication possible, will be amply rewarded by a great increase in the membership of the Guild. May we say it is the duty of every old member of the staff to belong to the Guild, and to do what little they can to promote its activities. It exists for a worthy object, namely to keep former and present members of the staff, no matter where they may be, in touch with one another, and in the Journal, which we hope will be published annually, will be found the names and present addresses of those former members of the staff who have been traced. It is the intention of the Secretary, once the Guild gets under way, to publish letters and short articles from members, to make the Journal still more interesting. The present issue takes the form of a war memorial number and should be in the hands of all the many student gardeners who have passed through Edinburgh. All former members of the staff who are not yet members of the Guild should communicate with the Secretary, Mr. A. McCutcheon, Royal Botanic Garden, Edinburgh.

CATALOGUES RECEIVED.

The season of bulbs is with us once again and the first bulb catalogue we have to record is that of Messrs. Carters of Raynes Park. It is an extensive list, copiously illustrated and offers a wide variety of bulbous plants for present planting. Detailed cultural hints are given in the case of almost every flower, so that the amateur has only to purchase and follow the directions given in the catalogue to have a fine show of flowers in next year's spring garden. Those who are desirous of planting in pots or bowls for house decoration would do well to get straight ahead with planting. The sooner the bulbs are in their bowls, the sooner will they flower. While those who prefer planting outside, can take a few days leisure to go through the pages of this interesting list and select those they wish for planting at the end of this month or beginning of next. Collections of choice bulbs are offered at reasonable prices and the section devoted to Christmas and Easter flowers is especially large this year, indicating the increasing demand for this class of plant. A section on lawns, with particulars of autumn treatment, will also be found in the catalogue.

Messrs. G. Bunyard and Co., Limited, Maidstone. An illustrated catalogue which will interest every fruit grower has been sent to us by this firm, whose fame as fruit specialists has spread far and wide. The detailed and accurate descriptions of each variety should make this catalogue of value as a work or reference alone. Messrs. Bunyard pay special attention to the stock used for their fruit, and one can rest assured that only the most suitable stock is used and that it is always true. For apples the Paradise stock they use is the true Broad Leaf of Rivers, which they have proved by many years' experience to be the best for general purposes. The question of pollination of cherries and plums is also dealt with and lists of varieties which should be planted together for mutual pollination are given.

Other catalogues which have since been received are those from:

Messrs. Little and Ballantyne, Carlisle, bulbs, roses and fruit trees.

Messrs. Wm. Cutbush and Son, Ltd., Barnet, bulbs and forcing plants. A well illustrated list.

Messrs. Fisher, Son and Sibray, Limited, two lists, one devoted purely to bulbs, the other to hardy trees, shrubs, roses and fruit trees, for general planting.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE KITCHEN GARDEN.

At this period the scarlet runner is a most useful vegetable, and the plants should be encouraged by keeping the roots well supplied with water. Even when the weather is showery a thorough soaking will be an advantage, because the foliage has a tendency to throw off the rain from the roots. Keep the pods picked off when young, unless the crop is intended for seed. Tomato plants growing in the open should have their tops removed. Several trusses of fruit have set, and they will be as many as will ripen before the bad weather. If the plants are growing in good garden soil, no stimulants will be needed, but clear water will be helpful during a dry period. Continue to cut out all side growths. Vegetable marrows are growing freely, and here it is not expedient to allow the fruits to become old; if so, the free-bearing qualities of the plant will be reduced. Feed those producing heavy crops with liquid manure or some fertiliser once each week. Early beets, such as the turnip-rooted variety, may be lifted directly the roots are large enough for the kitchen and stored in sand or ashes. Lettuce plants as they attain a suitable size should be planted out in a sheltered border. Early carrots are also ready for lifting. If left in the ground after reaching maturity many of the roots will split, which will impair their keeping qualities. Where young carrots are in demand and the necessary cold frames are available, a sowing of a stump-rooted variety can be made. These will be ready for the kitchen towards the end of the year.

THE FRUIT GARDEN.

Both peaches and nectarines are approaching the ripening stage, and to prevent loss of fruit by dropping examine the trees daily, picking all the fruits that may be ready for removal. The fruits should be fully exposed to the sunlight, and this is done by removing a few leaves or placing them on one side. See that new growth is carefully tied in and all lateral shoots pinched out. It is the latter that will shade the fruits if allowed to develop. Morello cherries are suitable for planting in positions where many fruits would prove a failure, and this year some specimens have carried excellent crops. When the fruit is gathered the annual pruning can take place, but this will not be a big task if due attention has been paid to disbudding. The main branches are left intact unless they show signs of decay, when such parts must be cut out. Discard as much of the old fruiting wood as possible, and tie in the current season's growth. If red spider is present, give the foliage a thorough cleansing with an approved insecticide. By pruning now the new growths will have a chance to become consolidated by due exposure to light and air, and such wood may be expected to produce crops of first-rate quality next year. All fruits on walls, such as plums, must be protected from birds, and if wasps are troublesome a few jars of sweetened beer placed here and there will account for many of these destructive insects.

Lawns.—Although the spring is a good time to sow grass seeds for making a lawn, good results can be obtained by sowing about the end of this month. Lawns and sports grounds can also have worn patches or thin grass put right directly play has ceased and before the bad weather arrives. Choose a mixture of lawn grass seeds from a reliable firm and when sown protect it from birds.

THE FLOWER GARDEN.

Roses.—Many roses will succeed on their own roots, and this remark applies strongly to the rambler section. During the next few weeks cuttings may be inserted in sandy soil on a partially shaded border. The cuttings are from 6ins. to 8ins. in length, and they consist of partially ripened shoots made this year. Usually the centre portion is chosen. With the ramblers a lot of wood suitable for cuttings will be found among the prunings. Sprinkle the bed over occasionally with clear water, and if the weather proves dry afford sufficient moisture to avoid any shrivelling of the cuttings.

Doronicums.—For early flowering the leopard's bane is very acceptable either for the border or cutting purposes. Now is a very good time to lift and divide them and plant in their permanent stations.

Chepstow. T. W. BRISCOE.

CONSERVATORY AND GREENHOUSE.

Richardia africana, which is so useful for a supply of white flowers for cutting during winter and spring, should now be repotted. All the old soil should be shaken off the roots, repotting them in a rich compost of good loam, rotten manure, leaf-soil and sufficient sand to keep the whole open and porous. Strong plants may be placed singly in 6in. or 7in. pots. Where large specimens are required three or four plants may be placed in 10in. or 12in. pots. Where they have been planted out in trenches for the summer they should be lifted and potted as advised about the second week of September. After potting, they should be stood in a deep frame, where the lights can be placed over them during spells of wet weather. Later on, as required, they should be placed in a warm house for forcing.

Nerines, which start the season with the brilliant N. Fothergilli var. major, are deserving of much more general cultivation. They should now be overhauled, examining the bulbs for mealy bug, which often proves troublesome. After cleaning they should be stood on a bench or shelf in a cool greenhouse. Usually no water is necessary at the root until they are in flower and begin to show signs of growth. Nerines usually flower best when the pots are crowded with bulbs, and repotting is not necessary so long as they are in good condition at the root. When repotting is necessary it is best done about this time. The compost should consist of a good loam, with the addition of a little leaf-soil and enough sand to keep the whole open and porous. A 5in. potful of bone meal may be added to every bushel of compost. After repotting, water at the root must be very carefully afforded until a quantity of new roots and growth is made. Too much water at the root after repotting is the most common cause of failure when dealing with bulbous plants.

Lachenalias, another beautiful genus of South African bulbous plants, of which there are many fine varieties, should be repotted during September. Unlike nerines, they should be repotted every year, otherwise they require the same cultural treatment. They are best grown in small pots, 5in. being a suitable size. Place four or five bulbs in a pot. Bulbs that are too small for flowering should be grown on in pans. With good cultivation they should make good flowering bulbs for next year. Lachenalias may be grown quite well in cold frames, but it is an advantage if they can be removed to a cool, airy greenhouse when they are developing their flowers.

Veltheimia viridifolia.—Where stocks of this plant exist they should now be taken in hand and started into growth. If in good condition at the root repotting is not necessary every year, and as it increases by offshoots, the side bulbs should not be detached every year, for if potted on as they require it they in time make fine large specimens. If it is desired to increase the stock the side bulbs can, of course, be detached when they part easily from the parent bulb. Stock can also be raised from seed, but it takes from three to four years for the bulbs to attain flowering size. Although this plant is not showy, it generally appeals to lovers of choice plants.

Aristea corymbosa.—This beautiful blue-flowered plant belongs to the Natural Order Iridæ, and is peculiar in being of a hard woody character. It is by no means easy to propagate successfully, but, in common with many other hard-wooded plants, now is a good time to insert cuttings. For this purpose the side shoots should be carefully detached from the woody stock and inserted in well drained pots of fine sandy peat. After being well watered the pots should be stood under a bell-glass in a cool greenhouse. It may also be rooted very successfully in a shallow sand bed placed on the top of a raised bed in a cool greenhouse. The rooted cuttings require very careful handling, as the brittle, fleshy roots are very easily damaged. This plant succeeds in a well drained compost consisting of three parts lumpy sandy peat and one of light loam. Careful watering at the root is essential at all times.

Begonias.—Winter-flowering varieties, as represented by the Gloire de Lorraine section, should be potted on as they require it. A quantity of late-rooted plants should be retained

FOR AUGUST AND SEPTEMBER PLANTING.

Barr's Flag Irises for Flower Borders, Shrubberies, and for Naturalising

AWARDED GOLD MEDAL AT THE ROYAL HORTIOULTURAL SOCIETY'S GREAT IRIS CONFERENCE.

TALL BEARDED FLAG IRISES.

The Iris is the "Orchid" of the flower garden, its blossoms being the richest and most varied in colour of all hardy plants. It should be extensively planted in flower and shrubbery borders and wild gardens. When established, the plants yield a great quantity of bloom.

BARR'S COLLECTIONS OF TALL FLAG IRISES (May and June Flowering)

3 each of 100 beautiful named varieties				£10 10s.
3 ,, 50	,,	,,	,,	£5 5s.
3 ,, 25	,,	,,	,,	£2 15s.
3 ,, 12	,,	,,	,,	24/- & 36/-
3 ,, 6	,,	,,	,,	12/- & 18/-

SELECTIONS FOR EXTENSIVE PLANTINGS

1,000 in 50 superb named varieties from all sections, £25, £35, and £45

MIXTURES OF TALL BEARDED IRISES (without names)

	Per 100 s.	Per 100 d.	Per doz. s.	Per doz. d.
Mixture of many fine sorts, from all sections	30	0	4	0
Mixed May-flowering varieties, chiefly purple and violet shades	35	0	5	0
Mixed Plicata and Amœna varieties, in shades of white and blue	40	0	5	6
Mixed Neglecta and Pallida varieties, blue, mauve and violet shades ..	40	0	5	6
Mixed Squalens, beautiful shades of blue, mauve, purple, rose, etc., shot more or less with gold or bronze	45	0	6	0
Mixed Variegata varieties, in shades of yellow and gold	45	0	6	0

BARR'S COLLECTIONS OF DWARF BEARDED ORIMEAN IRISES.
(Flowering during March, April and May.)

These beautiful Irises flower from March to May (before the Tall Flag Irises) and are therefore specially valuable in maintaining a succession of bloom from early spring. Being of dwarf growth they are suitable for planting in front of the taller-growing Flag Irises. They are also valuable as permanent edgings to flower borders and are charming subjects in the rock garden and for old walls.

3 each of 25 beautiful named varieties	35/- & 45/-
3 ,, 12 ,, ,, ,, ...	15/- & 21/-
3 ,, 6 ,, ,, ,, ...	7/6 & 10/6

Mixed Dwarf Orimean Irises (without names), 30/- per 100, 4/- per doz.

FOR FULL DESCRIPTIONS, SEE BARR'S HARDY PLANT CATALOGUE (FREE).

For the best Bulbous Irises, including Early Giant Xiphium, Spanish, English, and many beautiful species, see Barr's Autumn Bulb Catalogue, free on application.

WAKELEY'S Celebrated Hop Manure

THE ORIGINAL AND ONLY RELIABLE SUBSTITUTE FOR STABLE MANURE

AS USED IN THE GARDENS OF GREAT BRITAIN

DIPLOMA AND MEDAL, ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912

DO YOU REALISE IT?

A large bag of WAKELEY'S PATENTED HOP MANURE at a cost of only 7/- carriage paid to your door (if within 25 miles radius of London, or at a trifling extra if beyond), GOES AS FAR AS A CART-LOAD OF STABLE MANURE, without any of the defects of the latter; gives better results, is easy and clean to use.

Every ounce of Wakeley's Hop Manure is of value to the soil, supplying the necessary HUMUS in addition to the valuable plant food. Worthless rubbish is not added to make weight (as is the case of some artificial manures advertised).

Thousands do realise it, the proof of this is the constant flow of UNSOLICITED LETTERS received from time to time in praise of the wonderful results obtained at such a moderate cost (see Booklet for selection).

BEWARE OF IMITATIONS.—Genuine Only in our Marked Bags containing Guaranteed Analysis.

ILLUSTRATED CATALOGUE giving full particulars and testimonials sent on receipt of post card.

CASH PRICES (including bags):

Small (about 1 bushel)	3/-
Large (about 4 bushels)	7/-
5 Large	33/9
10 Large	65/-
20 Large	120/-

Carriage paid by Pickford's or to any station within 25 miles of London, including delivery if within free delivery radius of Railway Company; 6d. per bag extra for every 50 miles or part beyond. Maximum extra charge Great Britain, 2/6 per bag.

A. J. & C. ALLEN (Dept. A), Nurserymen, NORWICH

Notes from Maidstone.

A NEW PEAR

WE would call the attention of all lovers of pears to the variety Admiral Gervais, which is fully described in our New Fruit Catalogue, which we think will be of great value. In appearance it much resembles Easter Beurré, but it ripens a little before this variety. It is a good grower, does equally well in the open as a Pyramid or a Cordon. We now introduce it after twelve years' trial and we can confidently recommend it for English gardens.

George Bunyard & Co., Ltd., The Royal Nurseries, Established 1796. Maidstone.

THE RESULT OF OUR SWEET PEA COMPETITION

WHEN our Sweet Pea Competition started in June, we had little idea of the enormous interest that our readers take in varieties of sweet peas. This interest is proved by the number of entries received, far more than we hoped for even in our most sanguine moments. The total number of varieties mentioned on the competitors' coupons was 302, an amazing total. There is no doubt, however, as to which are the six most popular. They are:

1. CONSTANCE HINTON
2. PICTURE
3. POWERSCOURT
4. MRS. TOM JONES
5. ROYAL SCOT
6. WARRIOR.

The number of votes they received was much in advance of the next in order of popularity. Constance Hinton headed the list with 150 more votes to her credit than were accorded to Picture and 570 more than to Warrior, the sixth on the list. Although several readers were correct in their choice of varieties, yet not one succeeded in giving them in their right order. The first prize, of goods to the value of £30 from any advertisers in THE GARDEN, goes to—

MR. EDWARD CATT,
Harbour View, Iden, Rye, Sussex,

who had only one error in the order of the varieties. The second, of goods to the value of £10, to—

MRS. E. L. MORGAN,
Cefn Eithin, Swansea.

The third, of goods to the value of £5, is divided among three competitors—

MR. E. T. THISTLETHWAITE,
Wensleydale, Mays Lane Road, Barnet, Herts;

MR. C. A. CORKE,
Hobiezjolt, Sudbury, Derby; and

MR. H. M. WILSON,
19, Lee Avenue, Chadwell Heath, Essex,

who get goods to the value of £1 13s. 4d. each.

Consolation prizes of goods to the value of 5s. each are awarded to Mr. W. Barclay, West Lodge, Lamington, Lanarkshire; Mr. W. H. Baker, 45, Mostyn Road, Merton Park, S.W.19; Miss C. M. Beale, Roman Tower, Broadstone, Dorset; Mr. A. W. Beaumont, 6, Cherry Row, Lexden, Colchester; Mr. John Bedhall, Meriden, near Coventry; Mr. S. Davy, Oulton Lodge, Aylsham, Norfolk; Mr. G. A. Funnell, The Gardens, Brambletye, East Grinstead; Mr. Geo. H. Hearse, 53, Parade, Pontypridd, Glamorganshire; Mr. S. C. Holbrook, Elm Croft, Jersey Road, Gloucester; Mrs. Humphreys, Rye, Cranleigh, Surrey; Mr. W. A. C. James, Duncote, Towcester; Mr. N. Lambert, Inglecroft, Fulford, Yorkshire; Mr. F. J. Milburn, Hutton Rudby, Yorks; Mr. T. B. Milburn, Hutton Rudby, Yorks; Mr. A. P. Millard, 10, Albert Road, Newtown, Bishop's Waltham, Hants; Mr. A. H. Preston, Southwick Park, Tewkesbury; Mr. E. Rackley, Alyhwoods, Burghfield, Reading; Mrs. P. H. Sainsbury, 47, Belmont Road, Bushey, Herts; Miss E. Walters, Broadstone, Dorset; Miss W. Wood, Marsden, Ashtead, Surrey.

The Six Most Popular Sweet Peas as Decided by Our Readers are:

1. CONSTANCE HINTON
2. PICTURE
3. POWERSCOURT
4. MRS. TOM JONES
5. ROYAL SCOT
6. WARRIOR

Many readers may be interested to learn what were the next six most popular sweet peas:

7. Hawlmark Pink
8. Charity
9. Royal Purple
10. Charming
11. Matchless
12. George Shawyer.

Short colour descriptions of the leading twelve varieties may be of interest to readers who are not acquainted with these popular sweet peas. Constance Hinton is a showy white variety, Matchless has blooms of rich cream, Picture is a pink sweet pea suffused with apricot. Hawlmark Pink, Charming, and George Shawyer were other pink and rose varieties selected. Powerscourt is a pure lavender; Mrs. T. Jones, a bright light blue; Royal Scot, brilliant scarlet; Royal Purple, a rich purple; and Warrior, a bronzy maroon.

TULIPS FOR THE GARDEN

WHEN I am asked to write an article for THE GARDEN containing a specified number of words about the tulip and to give a selection of named varieties for the ordinary garden, I have to consider what will be most interesting to its readers. The tulip is undoubtedly the most gloriously coloured flower that we have in the spring, and when I see my fields of them in full bloom I never fail to appreciate the wisdom of Nature in allowing the daffodil to be first with its more limited and delicate shades of colouring. The range of colour in the tulip is, perhaps, as complete as that of any other flower. Starting with the so-called black, and, indeed, La Noire is as black as anyone would wish it to be, and passing through all the colours and combinations of colours of the rainbow, we arrive at a very pure white. Colour is, however, not the tulip's only charm, its simplicity of form and stately carriage give it a fascination all its own, and flowering, as it does, at a time of the year when Nature is not too lavish with brilliant colours, it is one of the most valuable flowers we possess. It is easily grown, and will flower well in almost any soil and position provided it is given reasonably fair treatment. It does not require a very rich soil, but, on the other hand, it will not give of its best in a dry, hungry sand. The bulbs should be planted in October or not later than the end of November for the best results, although I have planted later with fair results. The bulbs should be set about 4ins. to 5ins. deep. Some of the small species tulips, such as dasystemon, need only be covered with about 3ins. of soil.

For the best results the bulbs should be taken up each year when the foliage has died down. They should be dried off in a cool, airy shed and only the larger ones replanted. If left in the ground they soon become small owing to overcrowding and cease to give satisfactory flowers, and it is then best to throw them away and procure fresh ones. Bulbs that have been planted in formal beds and have to be cleared away before they have died down naturally, in order to make room for summer bedding plants, will not give satisfactory flowers the following season however carefully they may be transplanted and ripened off. When arranging your plantings you should not forget that the tulip is a very valuable flower for indoor decoration and you will not want to cut those in your beds and borders. Be wise, therefore, and have a reserve supply somewhere out of the way in your kitchen garden where you can go and cut to your heart's content.

When selecting a site for tulips, remember that they do not like a windy or a very wet position. They like shelter but not shade, and good, deeply prepared soil without being too rich.

Tulips can be grown in pots in soil or fibre, and many varieties will force, but great care is required to get early blooms.

About the species tulips I hardly think I need say very much, as with a few exceptions they are not suitable for the ordinary garden. I have found T. præstans, an early and gorgeous vermilion scarlet with several flowers on each stem, does well in ordinary soil, so also does Eichleri, another of similar colouring and flowering a little later. T. dasystemon with its many flowers of white and yellow does well, increases and seeds freely. It is dwarf and adapted for edging. T. sylvestris, a gracefully drooping deep yellow flower, I find does best when naturalised, but it is a very shy bloomer. T. australis is a similar variety, and as far as I have seen from one season's trial, it seems far more satisfactory than sylvestris. The charming T. Clusiana or lady tulip, with its slender stem and graceful little white flower striped with rose, requires a warm and light soil.

But returning to the practical treatment of bulbs, the tulip lends itself to a variety of schemes of planting. Groups of a dozen or more bulbs of each of a number of varieties arranged in a border give a charming effect, but the place to which the tulip is most particularly adapted is the formal garden. The popular arrangement of the Darwin tulip Clara Butt on a groundwork of blue forget-me-nots is always beautiful. Panorama with its large tawny flowers blends well with an old brick wall. Beds of mixed tulips, gay, dazzling, even daring in their colour contrasts, can please the eye amazingly. Beds filled each with one variety and arranged in colour schemes: yellow and purple, orange and primrose, red and brown, black and white, and many other contrasts that will suggest themselves to individual tastes.

The tulip is divided into various classes, but I am only going to mention the earlies, cottage and Darwins. Of the earlies, putting aside the Duc van Thol and other short-stemmed varieties and the doubles, I consider the following the best varieties: Prince of Austria, orange red and deliciously scented; Keizerskroon, red, edged yellow, a most gorgeous flower; Proserpine, cerise; Van der Neer, purple; Montrésor, deep yellow; and White Pottebakker.

The cottage tulips, so called because they were re-discovered by the late Mr. Peter Barr and Mr. Baylor Hartland in cottage gardens throughout the country and popularised by these two enthusiasts, are almost as varied in their range of colouring and more varied in the form of their flowers than the Darwins. They have many shades of yellow, a colour which is lacking in the Darwins. They are very graceful in form, and quite a number are sweet-scented, a distinct advantage when they are required for house decoration. When cut, however, many of them have a tendency to droop their heads in a most annoying manner. And now for my dozen of the best for the ordinary garden. Boadicea is a fine orange scarlet and sweet-scented; Ellen Willmott, a nice shade of primrose; Inglescombe Pink with its salmon pink flowers is a general favourite; Prince of Orange, rich orange scarlet, one of the most striking and satisfactory tulips I know; The Fawn, a delicate shade of rosy fawn; gesneriana major, fiery cochineal

A BORDER OF MIXED MAY-FLOWERING TULIPS.
Plant these next month for an effective show in spring.

red, the best for a brilliant display in the garden and most gorgeous when fully open in the sun; Solomon, a lovely pale rosy mauve and one of the most beautiful; gesneriana lutea, clear deep yellow; Cassandra, a vivid cerise; Goudvink, golden chestnut; Mrs. Kerrell, soft pink; Carrara, a glorious white slightly tinted with bluish grey, at present rather expensive, so I will give as an alternative White Queen, which is creamy blush and a very nice flower.

Passing from the cottage varieties to the Darwins, I might explain that the Darwins have strong and tall stems, blue or white, and never yellow, bases to the inside of the flowers, and generally rounder and shorter flowers than the cottage. My selection of a dozen must include the following, which I have found satisfactory in every way, fine flowers and good constitutions: Baronne de la Tonnaye, a fine tall variety, bright rose with a margin of silvery rose; Clara Butt, the popular salmon pink, could not possibly be omitted, though some might consider its stem to be on the short side; Farncombe Sanders, the best of the cochineal reds, a fine bold flower with a long stem; Glow, vermilion scarlet, a very sturdy and satisfactory variety; King Harold, crimson maroon, another great favourite; La Tulipe Noire, very nearly but not quite black; Margaret, clear pale blush, a fine globular flower; May Queen, a glorious rich pink; Pride of Haarlem, cerise, a great flower and undoubtedly entitled to its place among the select twelve; Rev. Ewbank, clear lilac with pale dusty margin; St. Simon, purple flushed red, seems to appeal to everyone who sees it on my fields, and that spells popularity; Suzon, another great favourite with its flowers of soft rose shaded with cream; Melicette, mauve with a charming clear bright blue centre; and I positively must mention the beautiful white Zwanenburg, rather expensive perhaps, but possessing a charm and fascination that render it quite unique.

Now, as I have exceeded my allotted space, I must stop, though I seem to have mentioned so few. This, however, was inevitable, for all tulips have their own particular charm, and there are such an infinite number of varieties.

W. A. WATTS.

DAFFODILS TO GROW IN THE WOODLAND

WHEN selecting narcissi for this purpose it is essential to choose those kinds which are moderate in price and available in quantity. This being so, I purposely omit many lovely, rare or costly varieties which, for various reasons, are beyond the reach of the average grower. Most of the trumpet daffodils flourish in the grass, and one which has impressed me favourably of late years is FAIRY, a flower of immense size, perfect shape and refinement, with a deep yellow trumpet, and perianth of a lighter shade. A colony of this charming flower rising out of the leafless growths of a group of Rosa arvensis, where these reach the grass, rarely fails to excite admiration.

EMPEROR.—This well known daffodil, with its rich, deep yellow trumpet and paler perianth, should be adopted by all for this picturesque planting. In rich alluvial soils and moist positions near the water's edge it will grow 3ft. tall and furnish annually sheaves of handsome flowers. Cool, northerly slopes, woodland rides and, indeed, almost any but a sun-baked position, will be found to suit this effective and well tried flower.

GOLDEN SPUR, from the Netherlands, although mainly used for forcing, is an excellent kind for naturalising, its large

DAFFODILS PLANTED IN BOLD DRIFTS LOOK VERY EFFECTIVE AT THE WATER'S EDGE OR ON A GRASS BANK.

Digitized by Google

trumpets are distinctly lobed and of a deep rich yellow. It is one of the early-flowering kinds and in my estimation is of equal merit with the early blooming and excellent Henry Irving.

N. MAXIMUS is one of the richest coloured daffodils we possess, the whole flower being of a deep golden yellow and poised on graceful 18in. stems. The richest soil of the meadow should be chosen for this particular kind and the bulbs planted deeper than is necessary for the majority, 10ins. being a good depth. On occasions it is a shy bloomer.

A WOODLAND PATH AT GRAVETYE.

N. MINIMUS is the smallest of all the true daffodils and one of the earliest to bloom, its dainty little flowers standing almost erect on slender squill-like stems are to be seen in the grass early in February each year. The happiest results I have experienced so far with this fascinating little flower have been in grassland where the latter joined a stream and the grass was kept mown like a lawn during its resting season. Under these conditions quite large colonies established themselves, together with the choice N. cyclamineus and Hoop-petticoat (N. Bulbocodium) in its various forms, seedlings appearing on all sides; these dainty species are jewels in their way, but moist places must be chosen for them.

N. OBVALLARIS (Tenby Daffodil).—I know no better early flowerer than this for planting along the margins of streams and other damp places, where it provides huge quantities of its compact neat little flowers, which on account of their stiff, erect stems are delightful for filling vases and most effective in the open air, where twenty flowers appear from one clump; it is one of the earliest to bloom, therefore we grow it in large quantities.

N. MME. DE GRAAFF belongs to the pale coloured trumpet daffodils and should find a place in every garden, the expanding graceful flowers are of a soft primrose shade, becoming pure white with age. It is a mid-season flower as daffodils go and revels in good loamy soil and leafy bottoms, such as we often find along the fringes of grass rides; planted in broad belts it is most effective and increases freely.

N. MOSCHATUS (THE MUSK DAFFODIL), from the Pyrenees, is one of the most distinct and interesting of this family, its pure white flowers droop gracefully from 8in. stems, reminding one of the elegant large snowdrops from Asia Minor. It is a precious flower for choice and partially shaded positions, but the bulbs should not be planted more than 8ins. apart, as it does not increase freely and as everyone rushes to gather its attractive flowers immediately it is observed, its chances of seeding are very small.

N. PALLIDUS PRÆCOX (THE BAYONNE DAFFODIL), is the earliest of all to bloom with me, its flowers are large and of a delightful creamy yellow generally, but these are variable and some may appear which are almost white. This Pyrennean daffodil flourishes both in sun and partial shade, indeed, it appears to enjoy a sunny slope, where a dozen or so flowers clustering about an old tree stump are more beautiful in effect than large masses; this is our prettiest early daffodil.

N. DUKE OF BEDFORD is a striking flower and one which immediately attracts attention on account of its size, the perianth is white and broad and the large, fine trumpet, clear yellow. It comes into bloom early and its flowers possess a pleasing fragrance; this handsome kind loves moisture.

N. EMPRESS is a very highly valued narcissus which may be planted generously. In any fair soil, it is a success. The flowers are attractive and of good substance, perianth white, trumpet rich yellow, they also appear in all their beauty just when the majority are on the wane; this is absolutely reliable for any and every purpose.

THE INCOMPARABILIS GROUP.

In the incomparabilis group, usually known as Star narcissi, will be found many indispensable kinds, which have proved most successful when naturalised, even the choice, new varieties are responding freely to this simple and picturesque culture. Those of special charm include:

N. GLORIA MUNDI, a tall handsome flower with yellow perianth and spreading orange scarlet centre. It is very effective when massed.

N. LUCIFER, which at first was underestimated. This is a really handsome narcissus, growing 18ins. high in strong land, increases rapidly and provides an exquisite effect when growing beneath the twiggy branches of hazel bushes; it also stands the sunshine better than the majority. The perianth is creamy yellow, the cup a glowing orange red; a single bulb will produce twelve in three years.

N. WILL SCARLETT is a strong growing kind with a large open fiery orange red centre, seated in its saucer of crimped white petals. I have tried this in a small way only, but it is full of promise and has a great future.

THE SHORT CUPPED DAFFODILS

comprise many of the most attractive and elegant kinds in the whole genus. Many flower late, and with the grass of the meadows becoming greener each day, the effect of these charming and delightful flowers is greatly enhanced. Of these, the old BARRII CONSPICUUS, with its rich orange scarlet centre, is always satisfactory and effective, both in meadow and wood. Others of charm are:

CŒUR DE LION, delicate primrose cup, fiery orange red, conspicuous whether planted in small groups or massed.

LADY GODIVA, perianth white, with short orange scarlet cup, increases freely in woodland soil.

SEAGULL is a most graceful kind with apricot centre resting upon a pure white base, a strong free grower and rather taller than the majority. This is a deservedly popular favourite for cutting.

LORD KITCHENER carries a flower of great size and substance, the broad, flat perianth being white and the large crimped open crown, pale primrose. This is a very effective flower.

MRS. LANGTRY is cheap and can be indulged in by the thousand by streaming the bulbs thinly over the rising ground in wood and meadow, where its frail and dainty flowers of a tender creamy white appear in profusion.

THE POET'S NARCISSI.

Our picture would not be complete without a few of the deliciously fragrant N. poeticus, which are the last of this large genus to bloom. The following naturalise freely here:

CASSANDRA, perianth large and broad, clear white, with small, dark red eye, invaluable as a cut flower.

HERRICK, a refined and shapely flower of good substance, perianth white, scarlet eye.

POETICUS RECURVUS.—This is the old Pheasant's Eye, so popular for its fragrant, white and red flowers.

ORNATUS.—A grand variety for massing, scarlet eye on a white ground, and the double white poeticus, with gardenia-like flowers of delicious fragrance, must not be omitted from our orders this year.

E. MARKHAM.

Gravetye Manor, Sussex.

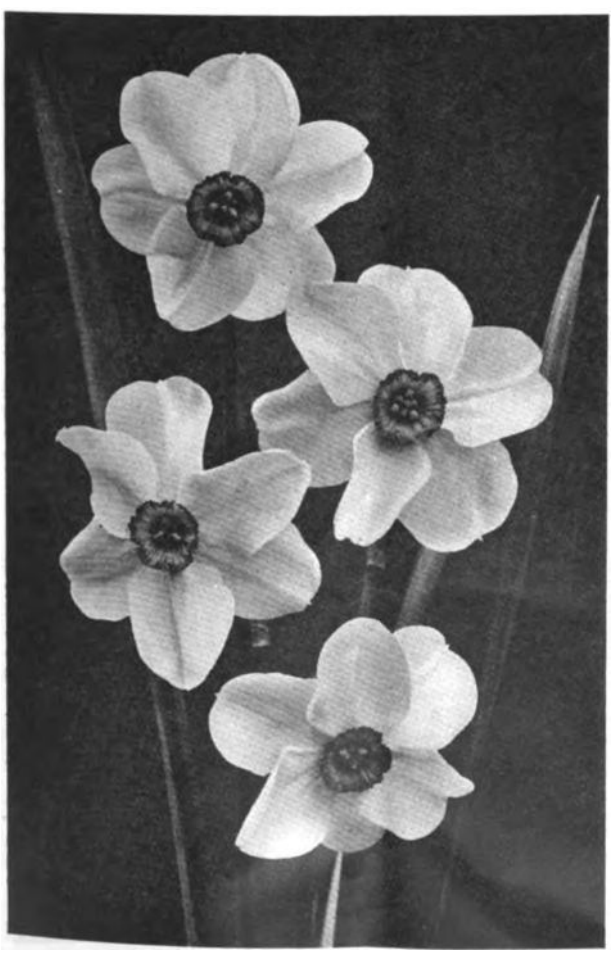
THE POET'S AND POLYANTHUS NARCISSI

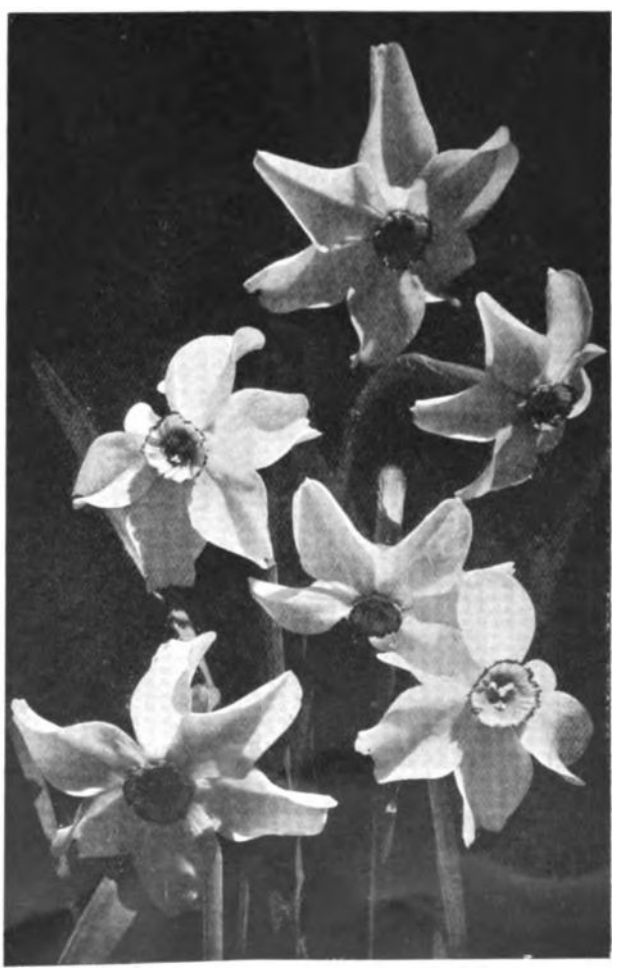
THE Poeticus section, generally termed the Poets by growers, are favourites of mine. They come late and thus extend the daffodil season. They are very free-flowering when well grown and have a delightful scent. The first newcomer in this section that I can remember was Poeticus ornatus, an early-flowering variety introduced from France and then taken up by those two pioneers in cut flower production, Mr. James Walker and Mr. Walter T. Ware. Success attended their efforts, as the old May-flowering P. recurvus had long been a favourite, and this new thing, flowering weeks before recurvus, took the market by storm. Then Mr. Engleheart took up the cross-breeding of the Poets and managed with the comparatively few varieties there were to work upon to produce within a short time flowers of superior size with a wider range of flowering season. Virgil, Homer, Horace, Comus, Cassandra and Epic were some of his first or early productions, and some are holding their own well to-day in spite of the host of seedlings which have since been raised. Horace is still one of the most popular varieties. It is a very good doer and has a very long stalk, some of which I have measured being 22ins. long. Homer is, in my opinion, the only Poet (bar ornatus) which does well under glass. Nearly all the other varieties I have tried produce such poor blooms that they are hardly recognisable. I will not pretend to give a complete list of all the best Poets now on the market, but will mention some of the best varieties with which I am personally acquainted:

Acme, a distinct variety with an all-red eye, a great favourite of the late Rev. Jacob's; Barcarolle, a nicely rounded flower, free blooming; Caedmon, a large firm flower with striking red rim to the eye, a fine exhibition variety, late; Dactyl, same type of flower as the last, tall grower, late; Horace, mentioned before, one of the best; Homer, early and especially good for pots; Jean Ingelow, rather early, a wonderfully strong grower; John Masefield, a very good show flower, very round bloom with extra large eye deeply edged with deep red; Kestrel, a good mid-season Poet; Lullaby, a good round, firm flower, late; ornatus, too well known to need description; recurvus, the old May-flowering Poet; Rupert Brooke, a wonderful variety to flower and increase, the strongest grower I have ever planted; Snow King, flowers of largest size borne on long stems, late; Socrates, one of the recurvus type, a fine firm flower, very late; Sonata, large flower with a large eye rimmed with a narrow band of red, one of the best of the late Poets; Ringdove and Sarchedon are both very fine exhibition varieties, and so is Striking, but a long price is still asked for them.

The members of the Poeticus family must be planted on good retentive soil. Moisture they must have. In Holland and the Fen district at home they get moisture because the water level is never far below the roots of plants. On higher ground a stiffish soil which will hold the moisture must be chosen. I have tried to grow Poets on light land where nearly all other narcissi grow to perfection, but they were miserable and had to be brought back to a much stronger and moister soil. I forgot to mention the double Poeticus (albus plenus odoratus) in my list. This is a great favourite with the general public. Its double white flowers are very richly scented. It does not flower until about the end of May or first week in June in the Midlands. This variety will not do the least good unless it is planted on stiff, moist soil. On any other soil it will not flower at all. It may produce buds, but they all turn into "duds."



CAEDMON, A FINE EXHIBITION VARIETY WITH A STRIKING RED RIM TO THE EYE.



THE FRAGRANT POET'S NARCISSUS, THE PARENT OF ALL THE MODERN POETICUS VARIETIES.

Digitized by Google

THE POETAZ SECTION.

This section is now generally merged into the polyanthus group (Division 8 of the R.H.S. classification). It was at first produced by a Dutch firm by crossing the existing polyanthus narcissi with a Poet.

They are rather hardier than the older polyanthus section, but do not succeed in all soils and climates. They grow well in Holland—protected with litter during severe weather—very well in some parts of Ireland, also Cornwall and the Channel Islands, but are not much good in the midland or northern counties of England—I mean to cultivate in the open ground. In pots or bowls in fibre or soil they are easy subjects to flower anywhere. Their strong scent is appreciated by many, but not by the writer. Some of the best of this section to be had at a moderate price are Alsace, Elvira, Admiration, Aspasia, Jaune à Merveille, Klondyke and Triumph. Some very beautiful things in this section have been raised by Mr. P. D. Williams of Cornwall, and others, but a long purse is required to secure a collection of these modern gems. J. DUNCAN PEARSON.

NOTES OF THE WEEK

STREAK DISEASE IN SWEET PEAS.

IS this disease hereditary, or does it develop through certain conditions of soil; do climatic conditions favour it; does it develop on some soils more than others? These questions are prompted by experience over several years, but more especially during the past two years. Let me say right here that I am fully cognisant of the fact that this subject is no new one, and it is evident that others have had experience of the trouble as well as myself.

As I am out to grow sweet peas as well as they can be grown and my efforts in this direction are frustrated by the plants going off wholesale, I want to know why this comes about.

Perhaps it is unnecessary for me here to detail all the points about methods of cultivation adopted; suffice it to say that it has been the endeavour to give the best possible: such as trenching the soil, incorporating with the soil a fair amount of manure, liming, autumn seed sowing, non-coddling of the young plants—but, even with these precautions, we have disease badly.

Plants attacked are not only those grown on the single stem system, but also those which are unrestricted. The puzzling thing about the whole matter is the fact that there are certain plants under both conditions which are in good health and robust. So far, I cannot see that any variety differs from others, as all are alike in being diseased. If there is any difference in the plants grown under the two systems, it is found in that those grown naturally certainly show a less percentage affected, while the soil preparation for these was not so elaborate.

It is as well to mention that the soil is part of the kitchen garden which has been under cultivation for years, and consists of a light, sandy loam overlying gravel, of fair depth, but very hungry. I wonder if this is a cause of non-success? The plants do well during the earlier stages of growth, after being planted out, and excellent flowers with good stems are obtained, but after a month or six weeks from commencement of flowering the trouble begins. As a test, this year feeding has only been done at long intervals, and it seems, therefore, that feeding is not the cause.

On pulling up affected plants, both roots and stem are in a bad condition. I find little evidence of the nodules which should be found on the roots of healthy plants.

Of course, the unnatural system of disbudding and removing the tendrils obviously must throw the plants out of gear, but that success is obtained, nevertheless, under the system is equally certain.

I refrain from further remarks at present, but leave the subject here, in the hope of obtaining some definite information that will enable myself and others to overcome the trouble.—G. H. H., *Twickenham.*

TULIPS GROWING IN GRASS.

I HAVE made many enquiries, but I have never heard of tulips being successfully established in grass in the same way that daffodils or even crocuses are. My own personal experience confirms this. I have on more than one occasion planted different kinds in our churchyard, which seemingly should make an excellent home for them, but the only variety that has shown the least power of blooming from year to year is elegans. A poor starved-looking bloom occasionally does appear among the others, but this effort is not an annual one. I allow that there are exceptional places and conditions where a much greater measure of success has been obtained, where flowers have appeared annually for a certain number of years, yet even in these cases I do not think there has been any increase and the continuance has been due to the soil having been enriched before the bulbs were planted or to an annual top-dressing afterwards. Time, in the end, has invariably conquered. It would appear that even a good supply of nutriment is soon exhausted and that it is impossible to renew it adequately.

This accounts, I think, for the intermittent flowering and finding of many of the new species (?) in Italy and Savoy. The late Mr. Dykes held the opinion that almost all will eventually be found to be only varieties. Be this as it will, it is a curious phenomenon why in places well known to botanists, a new variety should suddenly appear and then never be seen again. If anyone wishes to plant tulips in grass, I would advise him to take the sod off and then enrich the soil underneath by the addition of old rotten cow manure below the bulbs and bone meal incorporated in the top soil before planting. There will then be in all probability a few years of decent bloom.

If a display is only wanted for one year there is no difficulty, provided no mice, rats or rabbits can get to the bulbs or young foliage. Bulbs may be planted in the ordinary way with a Barr's bulb planter, care being taken to put a pinch of good new rich soil below each one. Three are best for this job. One to make the holes with the planter, one to drop the soil and bulb in the hole and a third to fill it up with the round wedge which the planter took out. It will be seen that the tulips do not die out when they cease blooming for, years after, the one large leaf will be sent up, which is the signal for no flowers.—J. J.

THE GLOBE THISTLE GIVES A STRIKING DISPLAY IN A GROUP WITH A SHRUBBY BACKGROUND.

THE GLOBE THISTLE.

THE enclosed illustration demonstrates the value of this excellent plant where large spaces are to be filled artistically. Against a background of trees, for example, the globe thistle (Echinops Ritro) will create quite a sensation if grown well, because the shelter afforded by the trees enables the plant to maintain its upright status without the necessity for staking or tying, which spoils the appearance of plants of a natural spreading habit. For the wild garden, or, as a relief in the evergreen shrubbery, this beautiful thistle with its rounded heads of a pretty blue and grey-green foliage, is one of the finest subjects that could be planted, especially if it has the distant companionship of one of the eryngiums—even our native teazle. The resemblance, with a decided difference, between the two plants is very pleasing.

No special culture is required by Echinops Ritro; it will grow in any garden soil, the richer ground producing the finest plants.

Digitized by Google

It is a good bee plant and the handsome blue, globular heads can be dried and used as everlastings for home decoration.—H. A. DAY.

A NOVEL BEDDING PLANT.

I AM sending you this photograph of an Anemone apennina growing in an open exposed border in Scotland. The tubers were planted here in the month of November. The first spring's growth produced nothing but leaves—there were only three flowers out of a hundred plants. The leaves soon died down and some quick-growing annuals were sown on the surface soil to make good during the summer. The tubers were left undisturbed the following winter, and the illustration shows the second spring's result. The gorgeous blue colour of the flowers could be seen from the road, and it attracted many gardening enthusiasts, who came to enquire the name of this "new flower." The show of bloom lasted for about a month.

As this type of anemone is usually associated with shady nooks, rockeries, and naturalisation in grass, I thought I would give publicity to this photograph, which, perhaps, in itself will commend the possibility of employing Anemone apennina for ordinary spring bedding. On looking through many provincial bulb catalogues I could find no mention of Anemone apennina. I see that the list of a well known London firm contains this beautiful little flower, priced at about the same rate per hundred as the better quality crocuses.—E. W. TATTERSALL.

THE KAFFIR LILY.

ONE of the most valuable flowers for the late autumn is the Kaffir lily (Schizostylis coccinea), which grows to the height of 2ft. or 3ft. and has something the habit of the gladiolus. The Kaffir lily, which is a native of South Africa, produces flowers of a very bright crimson colour, particularly valuable for cutting. The plant is perfectly hardy in most situations and it deserves to be more extensively grown than is the case. In the ordinary way the flower spikes begin to develop in October, but, in a mild season spikes of bloom are often produced almost to the end of the year. Although the requirements of the Kaffir lily are simple and the plant will grow almost anywhere, it appreciates careful treatment. Of course, on account of its habit of flowering so late in the year the schizostylis has to face a good deal of rough and inclement weather. On this account it is wise to plant the bulbs at the foot of a wall or fence with a south aspect. Here, in the event of severe frost, it is possible to give the flower spikes a little temporary protection in the way of mats. The Kaffir lily revels in a rich soil and it likes abundance of water, especially during the summer. Bulbs newly planted in the early autumn will come into flower in about two months time. It is worth while supporting the flower spikes with stakes as the stems are very apt to get broken in windy weather. The Kaffir lily is an interesting plant for culture in pots under glass or even in a sunny room.—S. L. B.

EVERLASTING FLOWERS.

THERE are numbers of flowering plants in the garden, that as they open in the summer, are not the least attractive, but gathered at the right moment have a value when most other blossoms have gone. We call them "everlastings," and though it may be a rather ambiguous term, it at least conveys the idea of flowers that may be kept for a time beyond ordinary subjects. These blossoms cover a rather wider range than most people unacquainted with them would imagine. You find them among hardy perennials, biennials and annuals and all of them may be grown out of doors and in most gardens. Those who have no glass accommodation and, consequently, are sometimes at a loss for flowers for the home after chrysanthemums and other outdoor blooms have gone, might do worse than turn their attention to, and specialise in, a bed of them with a view to providing something of interest for room decoration in winter. They are not as attractive as freshly gathered flowers from the greenhouse, but they are good substitutes from November to April, before spring flowers appear in quantity.

ANEMONE APENNINA USED AS A BEDDING PLANT.

In hardy plants alone we have some that are of the easiest possible culture, calling for no special soil or treatment, yet providing good material for the filling of vases, cut when half opened and allowed to dry before being deposited in a room. Statice (sea lavenders) are useful, and S. latifolia, bearing heads of dark blue flowers, is one of the best. Echinops (globe thistles) are handsome perennials which show up well in vases to themselves. E. Ritro, a dark blue, and E. sphærocephalus, white flower heads and silvery white foliage, are attractive. The sea hollies (eryngiums) furnish us with branches bearing many spiny bracts of metallic colourings. I mention E. amethystinum, a beautiful plant for the borders, growing about 3ft. in height, bracts as well as stems being of a bright amethyst colour. E. tripartitum is a dark blue species at its best in autumn. E. Oliverianum has steely blue bracts.

The blue cupidone (catananche) is comparatively little known. It belongs to the daisy order and bears flowers, that, when dried, add interest to a bunch of everlastings.

Physalises are very popular. They are much in evidence in September and October and are in demand for decoration. P. Franchetti, bearing scarlet seed vessels; P. Alkekengi, orange red; and P. Bunyardi, a hybrid, bearing a great profusion of pods, are all worth growing.

Gypsophilas, as represented by G. paniculata and its double forms, provide one with spreading panicles of airy lightness, and are too well known to need more than mention among flowers for winter use.

Biennials do not embrace many that serve our purpose in this connection; perhaps the chief is honesty (Lunaria biennis), the silvery seed pods of which are indispensable in schemes for flowers for winter decoration.

Rarely does one meet with the dipsacuses, or teasels, in the garden. Most people who know anything of them, still look upon them as wildings, to be found in quarries and isolated stony places, but it is a mistake to shut one's eyes to their use as garden tenants. Some years ago I secured, from a disused quarry, some heads from which I extracted seed, sowed it, and in August I cut quite a number of the—to me—attractive stems crowded with heads resembling large thistles. They are biennials, need sowing in May and come to maturity in the following year.

Annuals give us helichrysums, rhodanthes and acroclíniums. All, with the exception of rhodanthes, will do well outside and seed can be sown on a sunny border, but even rhodanthes can be so treated if sowing of seed is deferred until the end of May. These provide plenty of flowers, but, like all other flowers intended for future use, need to be gathered before they have expanded very far.

In arranging everlastings for winter use, it is best to do so loosely, either in vases or baskets and the only embellishment they need are light grasses or fronds of dried ferns. A suggestion of perfume may be brought about by interspersing sprigs of lavender among them.—CLAREMONT.

SPIRÆA BRACTEATA.

DURING the months of May and June groups of this white flowering shrub are decidedly attractive, and indeed conspicuous, by reason of the wealth of blooms which clothe the slender arching branches.

S. bracteata is a distinct shrub of rounded habit and reaches 8ft. in height when fully grown. The flowers are pure white and produced in profusion in clusters from the tips of the leafy twigs which spring from the previous year's growths.

It is a native of Japan and succeeds admirably with me near the waterside, where its flower-laden growths weep over to the water and are very attractive.

At no time should the bushes be permitted to become dense and thus filled with a lot of useless dead wood, otherwise the true graceful character which is such a feature of this shrub is lost.—E. M.

BULBS FOR YOUR SPRING GARDEN

IT is a far call from August to the months when the main show of bulbs adds zest to our spring gardens, and yet from now onwards gardeners take an increasing interest in them. There is no group of plants that has such a range. The autumn-flowering kinds, such as crocuses and colchicums, will soon be in flower, closely followed by the earliest forced hyacinths, and so the tale continues until the last of the tulips are over. Something is in flower for nine months, from September to May. To many the planting time is most fascinating.

TULIPS FOR BEDS AND BORDERS.

DAFFODILS FOR WOODLAND AND LAWN.

IMAGINATION is at work and colour schemes are made long in advance; in fact, planning takes many hours that are interesting and enjoyable. Most of the bulb catalogues have now been sent out and are eagerly pored over by everyone in touch with gardens. That the general quality of bulbs is increasing there is no doubt. Their season is now prolonged, and some kind of bulb can be found for every purpose, a sure sign that they are becoming more and more popular in every class of garden and among every kind of gardener. Make sure of getting the bulbs you want by ordering early.

COMMENTS ON "THE GARDEN" SWEET PEA COMPETITION

THE recently concluded sweet pea competition in THE GARDEN has been not only interesting and attractive, but valuable in several directions, apart from its main object of indicating the six most popular varieties. The competition has been a great success with respect to the huge number of coupons submitted. In itself, this is encouraging, for it plainly proves that public interest in the most popular annual is not decreasing.

The number of varieties of sweet peas in commerce at the present time is truly bewildering, probably well over five hundred. A really extraordinary number, over three hundred, were mentioned on the voting papers.

What may one gather from the result? I think it provides answers to such queries as "Are decided self-colours preferred to 'mixed' and undecided tints?" "Is any real attention paid by the general public to points such as size of flower, scent, vigour of growth and ability to withstand the effect of sun?" "How long does it take the general public to recognise the merit of a novelty which is a real improvement?" "Bearing in mind the fact that thirty or more novelties are placed on the market every year, do sweet pea growers, as a whole, discern slight improvements on existing varieties, or must a novelty be greatly superior to existing kinds before it is appreciated?" "Does the general public cleave to its old favourites long after they have been superseded by newer and better ones?" "Will the result of the competition surprise anyone in close touch with sweet pea matters?"

Answering the last question first, I think not. I did not enter for the competition, but several weeks ago submitted a forecast to the Editor of what I considered would be the final twelve varieties and the order of their preference. My order of preference was incorrect, but in eleven cases out of twelve my list was right, the only error being the inclusion of Hebe instead of Hawlmark Pink. I gave the list from experience of public taste, not from personal preference.

One cannot help noticing, on looking through the list of the twelve leading varieties, that clear, decided colours are obviously preferred. There is not one which might be termed "mixed" or even "delicate." Eleven out of the first dozen are self-colours, and, of course, all are of the waved or Spencer type. While all might be described as large flowering, it is significant that the leading pair are larger than any of the remainder.

Except in the case of George Shawyer, the last one, all are quite sunproof, and all—with perhaps the exception of Hawlmark Pink—may be truly termed "general purpose" varieties, useful alike for garden and home decoration as for exhibition. Referring to the official audit of the total number of times different varieties were exhibited at the N.S.P.S. 1925 annual show (1926 statistics are not yet available) gives their order of popularity from the particular point of view of the exhibitor. We find that, out of 105 varieties exhibited then, eight of THE GARDEN twelve are included in the most favoured dozen and eleven in the first twenty-four, Hawlmark Pink being the missing one with the position of forty-second in the audit.

The question of preference as regards scent is rather obscure, for six out of the twelve are strongly scented, and the remainder "fair to medium." Although many may disagree with the statement, I should say—from experience—that little notice is taken of scent in individual varieties by growers in general, colour, size and vigour claiming much greater attention. Would Powerscourt, for instance, occupy third position if it were practically devoid of perfume? I think it would. Length of stem, maintained throughout the season, is a decided asset to a variety, and we find only three of the twelve have a tendency to shorten their stems unduly towards the latter part of the flowering period. One cannot expect to find any variety less than two years old in the leading popular dozen, for quite apart from the question of the cost of a novelty, it takes at least three years from the time of its introduction for even an outstanding improvement to become generally known. Although all the first twelve are what may be termed "standard" varieties, the fact that Charming is included shows quite plainly that a real advance is comparatively quickly appreciated.

At the time of its introduction practically every one of the dozen was a decided improvement on all others of a similar shade. Such peas as Constance Hinton, Charity, Royal Purple and Mrs. Tom Jones quickly became popular, and have held their positions against all comers for years, in spite of the rivalry of later varieties.

The only feature of the result which surprises me is the high position of Hawlmark Pink. Of course, its colour is good, but it has few, if any, other claims to priority over several other pinks. Hebe, for example, is superior in size, vigour and length of stem. Perhaps one is inclined to forget that colour is, after all, the main attraction of the flowers.

C. H. A. S.

THE BULB GARDEN: FORCING HYACINTHS

AN essential point pertaining to hyacinth culture is to be early, for it is during the short, dark days when the blooms are most admired and their full value obtained. The merits of Roman hyacinths are well known, but I am afraid the Dutch Romans have not yet risen to their zenith of popularity. To precede the Dutch they are invaluable; obtainable in the same popular colours and by careful management they may be had in bloom from Christmas onwards.

To have the above two classes of hyacinths very early and typical in character one must not wait to be reminded that it is time to order by the arrival of the bulb catalogues; the bulbs must be ordered at least two or three weeks before these pour in, with a note on the order that they are required for earliest forcing. It is imperative that a bulb shall be given a certain period in which to perform its functions, and the longer that period the better. The bulbs must be potted immediately on receipt. A compost suitable for a free and healthy root action is one composed of two parts light loam, one part leaf soil, and half of sand. This may seem rather "poor," but it is better to rely on frequent applications of weak liquid manure when top growth is active, to increase strength of spike and promote earliness, rather than employ a too rich rooting medium. Another important detail is not to overpot—a 5in. size pot is quite large enough for four bulbs of either Romans or Dutch Romans.

VARIETIES TO SELECT.

As one aims at a good spike of the Dutch hyacinth, the compost must be made richer than that recommended for the Roman varieties; therefore add some old cow manure and a little bonemeal. Three bulbs in a 6in. pot is a good number. The varieties are very numerous, but most can be relied upon to throw up good spikes when well grown, so it is not my intention to give a long list or to mention the names of any doubles, as the single varieties are the clearer in colour and more attractive. I do not depreciate the double varieties, however, as many of them throw up fine spikes, and where a large collection is grown, or double flowers find favour, they are valuable plants. The following will be found good single varieties: La Grandesse and L'Innocence, whites; Schotel, Grand Maître, King of the Blues and King Menelik, blues; Jacques, Moreno and Gigantea, pinks; General Pelissier and La Victoire, reds; King of the Yellows and City of Haarlem, yellows.

CULTURAL METHODS.

When potting see that the compost is moderately moist, then no watering will be required till the bulbs are taken out of the plunging material. One crock and a little of the rough potting material will do for drainage. The soil must be lightly pressed, a little sand placed under each bulb, and the apex of the bulb on a level with the surface. Half-decayed leaf-soil and old ashes form a perfectly safe medium in which to plunge the pots; first 2ins. of the former, and then about 3ins. of the latter. A shady position outside should be selected for the earlier batch as the sun often attains great power in September. In eight weeks time, or as soon as 2ins. of growth has been made, move the

Digitized by Google

pots to a cold frame from which light is partially excluded until the growth has turned green, and here they must have ample ventilation, excepting during severe weather, when they should be protected.

When commencing to force, first allow the bulbs one week in an ordinary greenhouse, then a week in intermediate temperature, and finally introduce to stove heat. The best position in the house is on a shelf suspended from the roof, where the maximum amount of sunlight reaches them; couple with this a moist atmosphere, and good spikes of bloom will result. JAMES A. PAICE.

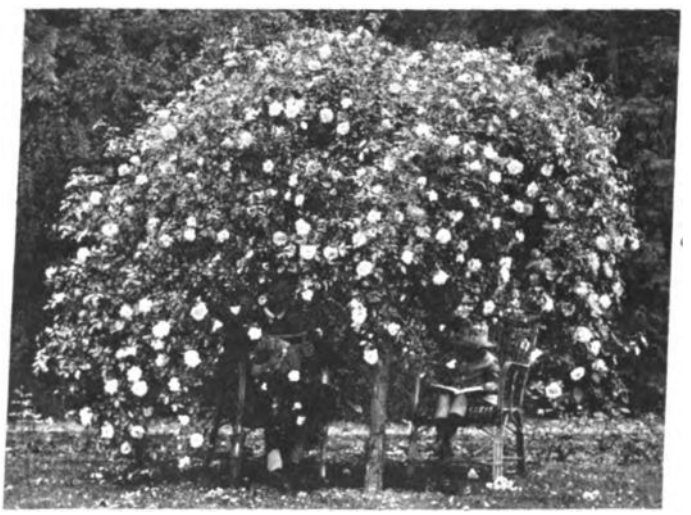
CORRESPONDENCE

PRIMULAS.

SIR,—I see I have made a slip in the communication sent you on primulas and printed in THE GARDEN of August 14th. I gave the credit of first using the rose border as a suitable situation for some difficult primulas to Sir I. Bailey Balfour. I have just come across a note in Vol. IX, page 168, of "Notes from the Royal Botanic Garden, Edinburgh," in which he ascribes the idea to Dr. Macwatt, author of "The Primulas of Europe." I give the quotation: "Dr. Macwatt of Duns has had great success with P. Parryi, *Gray*, planted in a rose border, and following him, I have planted several of the section in like quarters and so far with success in the way of foliage."—WILLIAM LOW, *Montrose*.

ROSE ALBERIC BARBIER.

SIR,—I am enclosing a photograph of a fine weeping standard of Rose Albéric Barbier, which may be of interest to some of your readers. The height of the specimen is nearly 9ft. and circumference of about 30ft., and it will cover easily a seat for four persons with ample headroom under the branches. It is supported by its own stout stem only, and is one of a row of several weeping standards which fourteen years ago I budded where they stand.—H. C. WOOD, *Lingfield*.



A FINE SPECIMEN OF A WEEPING STANDARD, ALBERIC BARBIER.

HOLLYHOCK RUST.

SIR,—I raised a fine batch of named double hollyhocks from seed last year, and all, with two exceptions, have been disfigured and rendered unsightly by the hollyhock fungus, Puccinia malvacearum. The soil prepared for them was liberally enriched with manure from the farmyard, and this, I feel sure, was the cause of the disease. Two spare plants I placed in a very odd spot some distance away in the shade of a large apple tree against a wire netting fence along a bank which had never been dug or manured. These two hollyhocks have bloomed magnificently, leading me to conclude that overdoses of manure, or a well manured piece of land, are favourable to the disease. Curiously enough, hollyhocks against walls in cottage gardens where manure is rarely applied bloom freely and continually year after year. I have sometimes seen it stated that impoverished soil will encourage the disease. My experience leads me to think otherwise, and it would be interesting to hear other opinions on the subject.—CEDRIC C. UNDERHILL, *Canterbury*.

THE PINK AND GREY GARDEN.

SIR,—Some interesting and beautiful combinations for the above garden were given a short time back in THE GARDEN. To that list may I add one more association which I have found most pleasing and effective? It is that of Centaurea cinerarea and the pink Begonia semperflorens, otherwise known as the fibrous begonia; and this is a combination which does as well for pot plants for the conservatory as in the open border—both subjects lending themselves so well for pot culture. This latter remark, however, is by the way only, as one can get much better results from outdoor planting, the growth being more natural and the viewpoint less interrupted than when seen in the glasshouse. I may add pink tuberous begonias are equally suitable, fewer plants being necessary to a given number of centaureas on account of the blooms being larger than those of the fibrous begonia.—C. T., *Ampthill*.

FEIJOA SELLOWIANA.

SIR,—*Re* Feijoa Sellowiana, as noted by various correspondents in THE GARDEN of June 12th and July 3rd, it should be remembered that even in milder climates than the south of England the fruits of this handsome shrub do not ripen on the plant, but normally drop to the ground while still hard and sharply acid. They should thereupon be gathered and laid on a shelf for a few days, or until they develop their characteristic and powerful aroma, when they are ready for the table. Those who try to eat them direct from the plant always court disappointment, whereas the properly ripened fruit is, to most palates, irresistibly luscious. As the skin possesses a slightly disagreeable strong principle, the flavour is more delicate if the fruit is cut with a knife and the pulp carefully scooped out with a spoon.

Seedling plants differ greatly in their time of ripening fruit, some bushes dropping all their fruits before those of neighbouring plants have attained full size. They also differ very conspicuously in size, shape, flavour, thickness of skin, amount of greyish bloom on the fruit, and other particulars.

Some of the best forms grown in California are now propagated by grafting, so that uniform plantings of selected fruit have become possible in recent years. A few of the more noteworthy varieties have received special names, the best known probably being the Coolidge, the Choiceana and the Superba.

The feijoa is not only good as a fresh fruit with sugar and cream, but it makes a superior jelly, a rich paste or marmalade, which some prefer to that of the guava, and an excellent preserve. Many will find it delicious in pies and tarts, using a few apples for softening the flavour if the latter be found too penetrating.

Once established, the plant is surprisingly drought-resistant.—S. S. B., *Redlands, California*.

SILVER LEAF IN FRUIT TREES.

SIR,—With reference to an article in THE GARDEN on Silver Leaf in Plum and Other Fruit Trees, in which you state that there is no known cure for this disease, I saw, a few years ago, a Victoria plum with extensive and unmistakable silver leaf. I asked the owner, an old man and a keen gardener of many years' standing, when he intended cutting down the tree, but he laughed and replied that he had known silver leaf since he was a boy and could soon cure it.

The tree was subsequently sprayed with a strong solution of permanganate of potash, 50 to 60 gallons being used, the surrounding ground as well as the tree being drenched. The following year the tree appeared quite healthy, showing no trace of silver leaf, and bore a heavy crop of fruit.

I regret that I am unable to say whether the tree has remained clean, as I have not seen the garden since, the owner having died; but perhaps some of your readers may have had experience of this "cure." The old man was so sure of it, and the results were so remarkable, that it seems to me to be worth at least a trial.—E. ROSE, *Beeston, Notts*.

THE ACHILLEAS.

SIR,—I am fully in accordance with your correspondent, "W. L." as to the merits of the achilleas (THE GARDEN, August 14th, 1926). Their blooming season is very long; they are exceedingly good tempered and the white varieties are admirable for cutting. But I confess I cannot agree with him when he gives the colour of A. Cerise Queen as "bright red." Far from being this, it begins as magenta and "goes off" a really horrible shade, which can only be described as "bled beetroot" colour!—R. E. H., *Bath*.

FASCIATION IN LILIES.

SIR,—Is it a common occurrence for lilies to become fasciated, and should the bulb be destroyed if the same thing happens every year? I have three bulbs of L. Henryi, two of which produce ordinary flowers; but the third, for the last two years, has had a monstrous head, unsightly, but wonderful. I counted this year the blooms on the fasciated stem, and they amounted to 160, exclusive of several immature buds. It seems incredible, but three people verified the number. The stem is 3ins. across.—F. A. G., *Dublin*.

A TRAP FOR EARWIGS.

SIR,—To catch earwigs, I have found filling the pots with crumpled-up grease-proof paper more successful than using hay. This hint might be useful to some of your readers.—(Mrs.) SARAH ROBSON, *West Hartlepool*.

THE FLOWER GARDEN

PANSIES AND VIOLAS.

How to Propagate.

CUTTINGS of these may be successfully rooted any time from mid-July to the end of August or the middle of September in the southern counties. Some persons who love these flowers are reluctant to attempt to grow them in the south, thinking that they will not succeed, but I can assure them that pansy and viola plants will thrive splendidly if they are properly treated. These plants, especially the cuttings, do like cool quarters to grow in; a really deeply dug, well enriched soil. If there is not a wall or fence available, the cultivator should construct a rough fence which will break the sun's rays and afford a cool border facing north, north-west or to east. A row of old pea sticks will do. These should be inserted in double lines and evergreen branches packed between. There not being any roots to such a fence, the cuttings may be inserted quite close up to it.

The best cuttings are those made of young shoots having firm stems, solid, not long ones that are hollow at the base and bearing flower-buds such as the one shown at *a*. Select cuttings similar to *b* and sever the stem just below a joint. These cuttings grow at *c*, shown at the bottom of an old plant, *d*, shown in the sketch. Some cultivators simply press them down with the thumb and thus sever them from the parent plant, inserting them without any further preparation. But the inexperienced amateur should not do this, he must remove the lower leaves and cut across the stem below a joint as shown in the sketch at *b*. Use a compost similar to the following: Some good loam, half-rotted leaf-soil, a small proportion of old rotted manure and some coarse sand. Mix the ingredients thoroughly and form a bed at least 4ins. deep as shown at *e*. On the surface, at *f*, place 1in. of sand, make the bed firm, insert the cuttings and water them with a fine rose watering-can. Water when necessary, and firm the cuttings in the soil after any frost may have loosened it. The north side of a low wall is an ideal position for a cutting bed.—GEO. GARNER.

TULIP GROWING IN BOWLS WITHOUT DRAINAGE.

THE growing of bulbs of all kinds in bowls and other receptacles without any drainage has become very common. It is true that the system has advantages in certain cases, where, for example, no good soil can be obtained unless at a prohibitive cost, or where for some special reason, such as lightness, it is desirable to break away from the orthodox old-fashioned pots.

But where it is as easy to adopt the one system as the other—all things being equal—I would never advise anyone to give the preference to bowls, etc., without drainage. They are more trouble to manage in my opinion, and the results as a rule are not equal to those grown on the ancient lines. I have seen now and again splendid examples of tulips in bowls grown in the latter way. Fill the receptacles with the compost, lightly pressing it down until there is sufficient upon which to place the bulbs. When the whole is finished off, their tops should be level with the surface of the material employed and this in turn should be half an inch below the top of the edge of the bowl. This must then be placed in a dark place, where there is plenty of air in order to promote root growth. After which period it must be placed in a window, which on all suitable days may be opened, being careful to avoid cold draughts or frosts at night. Where a greenhouse is available the treatment is the same as for pots. All through the growing period the great difficulty is to keep the medium sufficiently moist without being too wet. The surface will frequently appear dry when the bottom is wet and sometimes *vice versa*. In all cases of doubt feel with your finger or turn the bowl carefully on to its side in case of too much moisture.

For culture in bowls I would only advise such varieties as naturally grow tall and are easy to manage. When experience has been gained, others may be attempted. The following are those which I recommend for a start: Scarlet Duc van Thol, Vermillion Brilliant, Prince of Austria, Yellow Prince, Jenny, Keizerskroon, Hector and White Hawk.—J.

BULB PLANTING IN GRASS.

READERS of THE GARDEN who are desirous of planting a few bulbs in grass, but hesitate to expend a considerable sum upon a tool which may never be used again, may be interested in a simple and inexpensive bulb planter which I have recently put together in about an hour.

The parts used were:

(1) A piece of steel tubing 14ins. long, 1-16th in. thick, with an internal diameter of 1 3-8th ins. cut to shape, rough-sharpened and with holes ready drilled. Cost 1s. 6d.

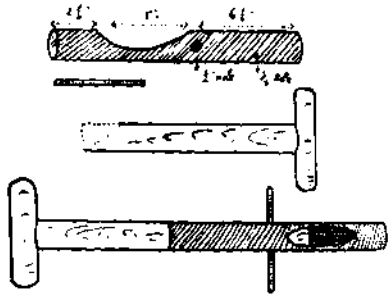
(2) An old door bolt, ½in. in diameter and 9½ins. long.

(3) A straight spade handle of ash, T-shape. Cost 4d.

(4) Two small screws (not really required if the fitting be carefully done). Cost, say, ½d.

The cost came to 1s. 10½d. If the bolt is not available, a steel rod may be purchased at about 8d., bringing the total cost to 2s. 6½d.

The tubing, as may be expected from the price, was "in the rough" and required a certain amount of trimming at the edges with a file and the wooden handle had to be pared down with a coarse file and spokeshave to fit the upper part of the tube and project about 2ins. below the top of the opening. The part projecting was trimmed down diagonally with a chisel to the rear of the tube opening and, so shaped, acts as a slide to throw out the wads of turf as they pass up the lower part of the tube in the course of use. A hole ½in. in diameter was then made through the handle shaft and the bolt driven through with a hammer. Two words of caution are needed: (*a*) sharpening should



1.—*Steel tube as purchased.* 2.—*9½ in. solid steel rod, ½in. thick.* 3.—*2ft. 8in. ash handle.* 4.—*The finished tool.*

be done outside (not inside) the cutting end of the tube, and (*b*) an effort should be made to clear the inside lower part of rust with emery or sand paper before beginning work, otherwise a period of "jamming" will result. A rusty tool never acts well. The illustrations will make matters clear. The result is a strong, reliable tool which works admirably.—S. H.

SOME BEDDING AND BORDER SUGGESTIONS FOR DAFFODILS.

IT must be remembered that the principle of what's one man's meat is another man's poison, holds good about gardens and daffodils. The most striking example, perhaps, is that of King Alfred, which enjoys the rudest health in Cornwall, but can only eke out a miserable existence in most midland counties. All red and red rimmed cupped varieties should be planted only where they can be in partial shade, say under the shadow of a north wall or in a thinly treed wood. There is no use in veiling this drawback to an extensive use of these taking varieties. They undoubtedly burn in the sun. Some do not show the result as much as others, Lady Moor simply looks very like Whitewell, but Mohican takes on an unpleasant look.

Daffodils may be combined with other plants to form "spring beds." Crocuses may be introduced to give an earlier display or late-flowering tulips to give a later one. Different coloured polyanthuses or primroses are very effective as carpeting; for example, a good rich purple, with a deep yellow trumpet, like Golden King, or the fine jonquil hybrid Buttercup; white shades of polyanthuses with Emperor; red shades with Empress, Weardale Perfection or a good giant Leedsii.

Again, daffodils may be planted in rose beds. No less a rosarian than Mr. Edward Mawley did this and he found no resulting ill effects on his pet flowers. Any group of plants in fact which are not placed too close together and have not made very long growth at the time when the daffodils flower, may have bulbs planted between them. For the guidance of those not very familiar with their cultivation, it may be well to say that if the daffodil plants are carefully taken up, so as to do very little injury to either their roots or their leaves, immediately after flowering, they can be transferred to an out of the way quarter to continue their growth and ripen off. It is useful to remember this should any

HERBACEOUS BORDERS.

Seasonable Reminders.

WITH the herbaceous borders at their best it seems almost too soon to be considering their arrangement for next year, but the gardener must ever look ahead if he is to be successful.

Certainly the most common fault with a herbaceous border is the wrong grouping of plants. Not so much is this fault pronounced in miscalculations of the heights of different plants as it is in the clashing instead of the blending of colours. Now is the time to seek a remedy for this fault in this way: See that the different plants are labelled with a tab which indicates the colour of the flower, *viz.*, "Delphinium, dark blue with white eye," "Phlox, pink with scarlet eye," etc. This work, if done now while the blooms are still on the plants, will obviate many of the mistakes which occur through slips of memory at a later season. Of course, in cases where an enthusiast is dealing with plants that he himself has bought, the name of the variety is more or less indicative, but it often happens that the man deputed to dig the herbaceous border during the winter months has a very confused idea of the colours of different varieties, hence I say there is occasion to put the name of the colour on the labels. The labelling of plants leads to the consideration of autumn-flowering herbaceous plants, and now is the time for every enthusiast to have his notebook at hand that he can make a note of any plant which he may see in flower and may desire to add to his own border.

With the approach of shorter days the prospects of more unsettled weather are greater, and for this reason it will be necessary to ascertain that the staking of big plants has been properly attended to. Particularly does this remark apply to such plants as asters, dahlias, solidagos, etc. It must be borne in mind that if they are not securely staked one storm may be sufficient to ruin many of them.

Now that the bulb catalogues are being distributed many people will be thinking of obtaining bulbs to provide an early display of bloom, and here again forethought is required. Bulbs which are set now if planted in a haphazard manner wherever there is a square foot of space are almost sure to be disturbed when the cleaning proper of the border commences. Therefore, if bulbs are to be used in the border, see that the ground is properly cleared for them and also mark out the boundary of each patch clearly with small sticks.

As a concluding note I advocate the early planning of the herbaceous border for next year's display. Get the correct measurements of the border and draw out a plan to a workable scale and when opportunity occurs make an entry on the plan. Above all, let the finished arrangement be the result of days of careful study rather than the outcome of a brain taxed to its utmost for one long evening.—W. HOWELL.

THE GREENHOUSE

HARD-WOODED PLANTS.

When to House.

HARD-WOODED plants rarely do well if they are retained under glass all the year round. When the specimens have finished flowering, those requiring a shift to larger pots are repotted forthwith and kept in the greenhouse, or, better still, in a vinery or peach house, until the new shoots have grown; those not repotted are similarly treated. By the end of June they are all ready for placing on a bed of ashes outside. In such positions, well managed plants are left until the early part of September in the northern counties, and until the end of that month in the southern. If the plants have been properly attended to as regards watering and syringing, the foliage will be healthy and free from pests now; but it is always wise to examine them thoroughly: to lay each one down on a sack or piece of matting and well syringe the under sides of the leaves before the plants are taken to the greenhouse or conservatory for the winter and spring months. It should always be borne in mind that hard-wooded plants, grown in pots, thrive best if they are grown under quite cool conditions, safe from frost. Also, apply clear water only and never allow the soil to get dry; see that the maximum amount of light reaches them. Continue to syringe azaleas, rhododendrons, acacias, cytisus and similar subjects for several weeks after housing.—HANTS.

LAPAGERIAS.

IN the days when a large conservatory was an indispensable feature of every extensive garden, the lapageria was a favourite, but many amateurs have never taken up its culture, we know not why. Lapageria is so nearly hardy that one might expect to find it favoured in greenhouses where little more is done than keep out the frost; it needs a fair amount of space, however, and therein may lie the reason for its lack of popularity.

To succeed well, lapagerias must be in a border and never in a pot; the roots love a moist, free run and when cramped in a pot, always a trifle "fiery," the plants suffer from thrip, bug and all the other ailments that torment the gardener. The soil they seem to like best is a mixture of half loam and half peat, with a slight admixture of sand, perhaps; full and free drainage is also necessary and plenty of liquid refreshment is also demanded.

Plant new plants firmly and train the shoots at first, for they need to be coaxed to take to the wires. We always find that cord is the best for training the shoots or, failing that, old wire; they never take readily to new wire. Pruning is a simple matter; weak growths are cut away, then the shoots which have flowered, unless where needed for extension; the pruning is necessary every year.

The plants are evergreen and their smooth, leathery leaves have an attractive appearance throughout the whole year. They dislike strong sunshine and so flourish best in a shady corner.—CLYDESDALE.

THE KITCHEN GARDEN

FRUIT PESTS.

Fighting the Winter Moth.

IN its narrowest sense the name Winter Moth is usually applied to the species known as Cheimatobia brumata, although this insect is merely one of a group which includes some of the most destructive fruit tree pests. The chief characteristics of the winter moths are that they appear from the end of September until the close of the year. The females of the insects are wingless, or, at least, have such small appendages as to be incapable of flight. On the other hand, the males have comparatively large wings and are very active in the air. In order that the females may reach a suitable position for egg-laying they must crawl up the trunks of the trees, unless, as occasionally happens, they are carried to the branches by the males. The eggs are usually deposited in some bark crevice, and from these the bluish green larvæ, striped with dark lines, emerge. Although the grubs of the winter moths are most harmful to apple trees, they will live on almost any kind of trees or shrubs. At first they eat into the buds in the spring, and, when the leaves begin to appear, they spin two or more together and so form a shelter in which they can feed in safety. When fully developed the caterpillars lower themselves to the ground, burrow into it, and form cocoons about the end of May, from which, in the late fall and winter, they will emerge as perfect insects.

Among the most effective measures to protect fruit trees against the winter moths are the prevention of their ascent of the tree trunks and the destruction of the females. The former is effected quite readily on account of the inability of the moths to fly. The process known as banding is one which every owner of fruit trees should carry out from now until the end of the year. Here some substance is used to encircle the trunk and so provide an area across which the moths cannot pass. Whatever substance is used, it must remain soft and sticky for a day or so (frequent renewal being necessary), and, on no account should it injure the bark. By far the best plan is to fasten bands of greaseproof paper round the trees. Let these be about 4ft. from the ground and tie closely both at the top and bottom. If the band is tied in the middle the borders of the paper open outwards and provide hiding-places for pests of all kinds. The paper is kept smeared with cart-grease, tar, or anything of a similar nature. The coating will have to be renewed every two or three days but if a pot and brush are kept handy, the job is quickly done. Much of this trouble can, however, be avoided if one of the proprietary brands of grease-banding compound is used. These materials are most effective, and do not need to be replenished so frequently as cart-grease or tar. In the case of young fruit trees with stakes, it is most important to grease-band the stakes as well, or the moths will travel up this way. This protection will serve the additional purpose of catching many of the moths. When these reach the sticky area they will become entangled and are easily removed and destroyed. Poultry keepers will find that it is a good plan to let the fowls run about under the fruit trees now and again, for the birds will destroy large numbers of winter moth caterpillars when these have descended from the branches.—L. B.

PARSLEY AND SPINACH.

Supplies for Winter and Spring.

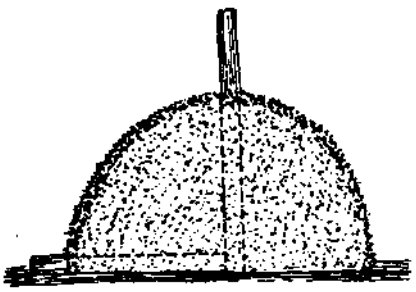
IT is almost impossible to grow parsley at any time of the year in some soils. In others the plants will grow like weeds, and we all know that the latter will grow without being cultivated—intentionally—although they thrive best in soil tilled for garden crops. Parsley seeds rarely germinate, ordinarily, in the open border in spring, sooner than six weeks from the time of sowing. At this season—from late July to mid-September—the seeds will germinate in three weeks time if the soil is kept moist, as it is warm naturally. The best plan is to sow the seeds in beds, having three or four rows in a bed at 1ft. apart, so that it will be an easy matter to put on some protecting material on hoops if severe frosts come. The best position is one on the south, south-west or west side of a wall, hedge or wood fence.

Digitized by Google

Sometimes, in sandy soils, parsley fails to thrive; where this is the case, try spreading on the surface a thin layer of fine gravel after the seeds are sown. Thin out the plants to 4ins. apart and transplant the thinnings. Sow seeds of prickly spinach thinly in rows 2ft. apart or near the foot of walls. Have the soil moderately firm and manured if poor. Thin out the young plants to 6ins. apart.—G. G.

BURNING UP GARDEN RUBBISH.

THE garden bonfire often proves rather a nuisance owing to the large amount of smoke that is given out by the smouldering heap. Of course, green and damp material



cannot be expected to burn up quickly, and it is better to get everything as dry as possible before starting the fire. On a sunny day spread the litter on the ground in a thinnish layer, and turn several times with a fork. Even if it is fairly dry, much of the material that has to be destroyed in the garden will not burn up briskly if it is just piled up in the ordinary way. A very good plan, by means of which a vigorous fire can be secured, is on the following lines:

Secure two rather stout stakes that are 4ft. or 5ft. in length. One of these is cut to a point so that the stick can be driven vertically into the ground, where it is wished to have the fire. The other is placed on the surface in such a way that one end just touches the base of the upright. Now build the rubbish round the stakes in the manner shown in the sketch. Pack the first layers of the material rather closely, adding the final lots in a lighter manner. Carefully withdraw both the stakes and there will then be a channel right from the base to the top of the heap.

Push some paper, or any dry material, into the opening near to the ground and set this alight. The air channel acts very much like the flue of a stove, and the flames roar upwards in fine style. Soon the heart of the mass is glowing, and the fire rapidly spreads to all parts of the pile. After the first ten minutes or so the amount of smoke given out is trifling, and the mass is rapidly reduced to ashes. With a fire of this kind under way, it is possible to consume green or damp stuff if this is spread in a thin layer at the upper part of the pile.—S. LEONARD BASTIN.

THE BURTON-ON-TRENT SHOW

UNIQUE interest centred in this show which, to give it its full title, was the Staffordshire and Midland Counties Floral Fête, and was held at Burton-on-Trent on August 11th and 12th. In the first place, it embraced the first provincial show of the National Gladiolus Society, and this in itself was by far the greatest and best show of the three efforts of the committee which has, with good results, set itself to the task of advancing the cult of the gladiolus in Britain. Seconding, the Burton Show was greatly favoured in securing the first round of the competition for the valuable trophy offered by Messrs. Abol, Limited, for the encouragement of plant breeding, and this entirely new idea in competitions among all classes of horticulturists not only excited a deal of keen interest, but brought together a remarkably fine lot of entries.

THE ABOL CHALLENGE TROPHY COMPETITION.

Fourteen important entries for this trophy provided a test of capability for the judges. The trophy was awarded to Messrs. J. Harkness and Sons, Leeming Bar, Bedale, for a grand display of "Regal" lupins which embraced the orange, bronze and apricot shades for which the strain is famous, as well as yellows, salmons, reds and subtle blue shades, in all a glorious demonstration of the evolution of new colours in an old plant which has frequently been the subject of glowing tributes from able pens.

The judges had some difficulty in deciding between this group and a very fine collection of Gladiolus primulinus staged by Mr. W. J. Unwin. There were some wonderful flowers in this exhibit, and had the class been one to show the greatest advancement in gladioli alone, judging would have been a comparatively easy matter. Other remarkably good candidates for the distinctive honour were Hemsley's new sidalceas, House's scabious, Fairburn's new phloxes, a new bedding geranium which is a distinct cross between Paul Crampel and West Brighton Gem, the new rose sport from The Queen Alexandra Rose named Charming Princess, Artindale's calendulas, and a fine group of hybrid astilbes. Altogether, this was an intensely fascinating series of wonderful new improvements in serviceable old plants, not one of which was out of place in the best of company.

Eight strong entries in the opening class for a representative group of gladioli occupying 100 super feet made a show in themselves. Messrs. Hewitt and Co., Limited, Solihull, were winners of the £20 first prize. A strong point was fine culture, but every variety was a good one. Mr. W. J. Unwin's second prize group was very exquisite and any loss of points was solely due to the absence of any but primulinus varieties or hybrids. Of these there were the very best of British, Continental and American varieties, together with a number of unnamed seedlings of the exhibitor's own raising.

Messrs. G. Mair and Sons, Prestwick, Scotland, showed their giant-flowered strain of gandavensis hybrids in the familiar style which has kept the firm so long at the head of the ranks of gladiolus exhibitors, and their awards were numerous, starting with the cup for twenty-four spikes of new varieties and going through all the separate colour classes.

In the amateur classes Mr. Watkin Samuel, of delphinium fame, proved himself to be no mean expert in gladioli. He won several of the principal prizes, and other successful exhibitors were Major Churcher, Mr. A. Amos and Mr. S. Gregg.

Non-competitive exhibits were extremely fine. Mr. Unwin staged a double-fronted group of imposing character and Messrs. J. Kelway and Son had upon their extensive stand a representative collection of their Kelwayi giants and Langprim hybrids. These pioneers in gladiolus breeding had many new varieties, among which several bearing the names of different members of the Kelway family were, naturally, of the best. Messrs. R. H. Bath, Limited, had several new shades of colour in home-raised seedlings, together with a few really good whites, and the cream of the most popular and serviceable varieties in both large-flowered and primulinus sections.

Awards given by the British Gladiolus Society.

Unless otherwise stated the exhibitor is the raiser.

Awards of Merit:

Name of Variety.	*Raiser.*	*Exhibited by.*
Louise Hemon (large-flowered).	Lemoine	Hewitt and Co.
Cyril Blake Amos (large flowered).	—	Lowe and Gibson
Lady Madden (primulinus).	—	" "
Mrs. G. Kellner (primulinus).	—	" "
Sir T. S. Hope Simpson (large-flowered)	—	Kelway and Son.
Burtonia (large-flowered).	—	H. Prins.
Pfitzer's Triumph (large-flowered).	Pfitzer	Konynenburg and Mark
Coryphee (large-flowered).	"	" "
Pour le Merite (large-flowered).	"	" "
Heavenly Blue (large-flowered).	"	" "
Phenomenon (large-flowered).	"	" "
Mrs. van Konynenburg (large-flowered).	"	" "
Rose Précose (large-flowered).	—	K. Velthuys and Co.

Diomede (primulinus)	—	Lowe and Gibson

The B.G.S. SILVER CHALLENGE CUP for twenty-four spikes of new varieties. First, Messrs. G. Mair and Son, Scotland; second (silver medal), Messrs. Konynenburg and Mark, Holland; third (bronze medal), Kelway and Son, Somerset.

THE "UNWIN" CHALLENGE TROPHY, won by Mr. Watkin Samuel, Wrexham; B.G.S. silver medal, Mr. Ivor Thomas, Liverpool; B.G.S. bronze medal, Major G. Churcher, Sussex.

THE "BATH" CHALLENGE TROPHY, won by Mr. A. Amos, Colchester.

The B.G.S. silver medal for amateur obtaining the largest number of points in Section "D," Major G. Churcher, Sussex; runner-up, Mr. Ivor Thomas.

Bronze medal for largest number of points in Section "C," Mr. A. Amos, Colchester; runner-up, Mr. S. J. Gregg, London.

"DOBBIE'S" SPECIAL FIRST PRIZE, won by Mr. A. Amos.

Group, 20ft. by 4ft (first prize £20 cash), winners, Messrs. Hewitt and Co. Limited, Solihull; second, Messrs. W. J. Unwin, Histon; third, Messrs. Konynenburg and Mark, Holland.

GROUP OF PRIMULINUS, 9ft. by 4ft, first, Mr. W. J. Unwin; second, K. Velthuys, Holland; third, Mr. H. Prins, Holland.

LARGE GOLD MEDAL to Mr. W. J. Unwin for finest group of gladiolus.

GOLD MEDALS to the following for groups: Messrs. Lowe and Gibson, Crawley Down (seedlings); Messrs. Kelway and Son, Langport; Messrs. R. H. Bath, Limited, Wisbech; Messrs. Konynenburg and Mark, Holland; Mr. H. Prins, Holland; Messrs. K. Velthuys and Co., Holland.

Mr. W. Glen, Chippenham, Wilts.

Successful exhibitors in the open trade classes included Messrs. G. Mair and Son, Ayrshire (14 first, 2 seconds, 1 fourth, 1 fifth); Messrs. Hewitt and Co., Solihull (2 firsts, 5 seconds, 3 thirds); Mr. W. Glen, Chippenham; Messrs. D. Prior and Son, Limited; Messrs. Konynenburg and Mark; and Messrs. K. Velthuys and Co. and Messrs. K. Velthuys and Co. included:

The winning amateur exhibitors included: Mr. Ivor Thomas (5 firsts, 2 seconds, 3 thirds, 3 fifths); Mr. S. Gregg (1 first, 3 seconds, 1 third, 3 fourths, 2 fifths); Major G. Churcher (3 firsts, 6 seconds, 4 thirds, 2 fourths); Mr. A. Amos (twelve prizes, including 7 firsts); Mr. Watkin Samuel (twelve prizes, including 3 firsts, 5 seconds,

GARDEN PLANNING

The Stepping Stones to the Good Garden are:

1. GOOD DESIGN: Implying a careful study of existing conditions and evolving a scheme naturally applicable to the site.

2. EXPERT AND CONSCIENTIOUS DIRECTION of its subsequent development.

3. WELL CHOSEN and skilfully arranged planting, in which the chemical constitution of soils, aspect, and local climatic conditions are important.

"EXPERTO CREDE."

GARDEN DESIGN is not merely a matter of planning the more formal portions of the garden. It should extend from the house outwards to the farthest limits of the landscape under our control. Every tree, shrub and plant can, and should, be used to produce that indefinable but æsthetic necessity that artists call composition.

To achieve it requires a knowledge not only of its architectural elements, but an intimate acquaintance with plant life that experience alone can bestow. Lacking this knowledge, wedded to a sympathetic appreciation of beauty, the most attractive paper scheme becomes a series of meaningless lines.

BURTON-ON-TRENT

We won at the above Show, held 11th and 12th August last, TWO GOLD MEDALS for our WONDERFUL COLLECTION OF GLADIOLI. We offer one Bulb of each variety shown in this collection of 50 different varieties at 8/6, two Bulbs of each variety, in 50 varieties, 16/-, six Bulbs of each variety, in 50 varieties, 45/- The new and most attractive Gladiolus at the Show called BURTONIA, raised by us and only stocked by our firm, only 500 to offer, 2/6 each.

OUR GOLD MEDAL CROCUSES.

The earliest flowers of Spring Exhibition Mixtures for Naturalising.

	Doz.	100	1000
Mixed purple and blue	8d.	4/6	40/-
Mixed striped	8d.	4/6	40/-
Mixed white	8d.	4/6	40/-
Mixed all colours	8d.	4/6	40/-

Crocus, special selected for Window Boxes, Pots and Flower Beds.

	Doz.	100	1000
Special blue, named	9d.	5/-	45/-
Special purple, named	9d.	5/-	45/-
Special striped, named	9d.	5/-	45/-
Special white, named	9d.	5/-	45/-
Special yellows, extra	1/-	8/-	75/-

EXHIBITION TULIPS.

THE DARWINS.—The most sturdy-growing, strong, upright stems with massive flowers:

	Doz.	100
Bartigon, bright fiery red	1/6	10/-
Clara Butt, clear pink, flushed salmon rose	1/-	7/-
La Notre, rose pink shading to silvery pink, centre blue and white. Extra forcer	2/-	14/-
Prince of the Netherlands, extra large solid flower of perfect form, rich brilliant cerise red, extra strong stems. First-rate bedder	2/6	15/-

The above 7 varieties, 12 bulbs of each, 10/-.

	Doz.	100
Professor Rauwenhoff, deep cherry rose with white base margined blue	2/-	12/-
Princess Elizabeth, extra fine rich soft rose, slight silvery flush at margin, centre clear white	2/-	14/-
Wm. Copeland, violet shading to lilac; when forced the colour is a beautiful soft lavender	1/-	8/-

The above 7 varieties, 100 bulbs of each, £3 10 0

NOVELTY COLLECTION.

THE COTTAGE TULIPS.—The most graceful novelties:

	Doz.	100
Amber, light amber coloured. Award of merit	1/10	13/-
Erasmus, large creamy white, long stem. Award of merit	1/10	13/-
Grand Yellow, very deep yellow, extra fine	2/-	15/-
Mrs. Francis King, very fine satiny rose	1/10	13/-
Nectar, vivid carmine red with clear white base. Award of merit	2/-	15/-
Spinosa, white flower on very tall stem	1/10	13/-

	Doz.	100
Sirene, the wonderful lily-shaped flower, of a very fine glistening satiny rose. First-class certificate, London, Amsterdam	1/10	14/-
Pearl, finest light rose	2/-	15/-
Prof. Westerdyk, wonderful lilac rose, very tall, splendid forcer	2/-	15/-
Triton, glowing carmine rose pure yellow base, the most attractive tulip yet raised, a real beauty	2/-	10/-

Novelty collection ten extra selected bulbs of each of the above 10 varieties, 100 in all, 10/-.

25 Bulbs each of the above 10 varieties, 250 Bulbs in all, 20/-.

Quality.—All bulbs which are not to satisfaction upon receipt may be returned to us and we will gladly refund money and postage. Complete list of other rarer tulips daffodils, etc., gladly mailed on request.

Fruit Tree Banding for Small Orchards

No matter how small the orchard, or whether you have only one or two fruit trees in a garden, it pays to use Stictite Tree Banding Compound.

It traps the crawling insects—Winter, March and Mottled Umber Moths, and so prevents the laying of thousands of eggs which would otherwise hatch out in the spring.

Stictite is extremely "tacky," and remains so throughout the season, so that one application is sufficient. It will not "run" or dry up after exposure, and withstands the rain.

The sooner the trees are banded the better the result will be. Winter Moth is the first to appear, and emerges about the end of September so that the bands should be on by that time if possible.

Stictite is supplied in tins from ½lb. upwards, and ½lb. will do for or six trees of about 8ins. diameter. The 4lb. and 7lb. sizes are in gold-lacquered pails with lids and handles.

½lb., 1/6; 1lb., 2/9; 2lb., 5/-; 4lb., 10/-; 7lb., 17/6.

Larger quantities quoted for if required.

Best Quality Greaseproof Paper

Only good quality paper should be used, and this is supplied as under. The paper is necessary for the application of Stictite, and is quite useless without the Compound.

Yards: 6, 2d.; 12, 3d.; 25, 6d.; 50, 9d.; 100, 1/6; 200, 2/6.

IRIS

of the June-flowering family

THEY are worth thinking of ahead—ordering early and planting at the best time, in July or early August. Put in then, the plants get their toes in before the winter comes. Take steps to order them **now.** Either buy the low-priced collection of excellent varieties offered below for **7/6** the twelve plants or send for our catalogue and make your own selection.

June-flowering Iris:—

Alcazar	Lavender blue and violet.
Archeveque ..	Reddish violet and deep violet.
Caprice	Reddish mauve and deep rosy red.
Dawn	Sulphur yellow, veined bronze.
Her Majesty ..	Pale rose and deep red.
Lohengrin ..	Cattleya mauve.
Mdm. Chereau ..	White, frilled azure blue.
Mrs. H. Darwin..	White, faintly marked violet.
Mrs. Neubronner	Golden yellow.
Oriflamme ..	Pure blue and blue purple.
Prosper Laugier..	Bronzy cinnamon and velvety crimson.
Rhein Nixe ..	White and violet purple.

One plant each of the 12 varieties, 7/6 post paid.

Have you seen our Hardy Plant Catalogue? It is better than most.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE KITCHEN GARDEN.

Onions.—In some gardens spring-sown onions did not germinate well, and consequently crops are poor, but those raised in boxes in a cold frame and transplanted are excellent. Many, however, are thick necked, and to check excessive top growth the stems should be bent over. This will encourage the bulbs to develop, and will promote firmness. If the bulbs are thoroughly ripened they remain in good conditionfor a long period. Onions that have already lost their foliage may be lifted and allowed to complete their ripening in an open dry shed.

Mushrooms.—If the droppings have been collected as advised, a bed should be made up inside. A September-spawned bed is usually valuable for autumn and early winter, when mushrooms are appreciated.

Turnips.—A good breadth of turnips should be sown, choosing a hardy variety such as Green Top. Where the roots do not mature they will produce a supply of nutritious tops in the spring.

The general work in the kitchen garden will consist of keeping it tidy, such as trimming hedges, cleaning paths, clearing away crops that have finished, and burning up all rubbish that it is possible to burn. The ashes are useful for all root crops. Deep cultivation is recommended, and where possible the plots should be trenched or double dug, with a liberal dressing of manure placed at the bottom of the trench.

THE FLOWER GARDEN.

It is a good plan to sow a number of annuals and biennials at this season with a view to producing a display of bloom to follow the flowering of narcissi and early tulips. Few realise the value of autumn-sown annuals, and there is a wealth of varieties to choose from. Among them will be found the Shirley poppy, cornflower, the many beautiful eschscholtzias, larkspur, sweet sultan, coreopsis, phacelia, calendula, nemophila and others. Sow thinly in drills 1ft. apart, and when the seedlings are large enough they should be thinned sufficiently for each plant to develop. This will be enough till the spring, because a few are sure to fail owing to damp or the ravages of slugs. The thinnings may be transplanted in the borders or reserve garden to supply cut bloom. Keep the plants free from weeds and prevent overcrowding, then strong, healthy plants will be built up which will have every opportunity of going through the winter safely.

No time should be lost with the numerous varieties of violas. Plenty of cuttings are available near the base of the old plants, and these should be placed 1in. or 2ins. apart in a cold frame. A well drained border may also be chosen, or they can be dibbled in where they are intended to bloom next spring. Such subjects as agapanthus in tubs need plenty of water and weak liquid manure. This plant will thrive in the open ground, especially where the soil is deep and rich, and the roots can be planted at any time now till March. The Crown Imperial should also be planted now. A note should be made of the hardy fuchsias and a few cuttings of each variety rooted. They are beautiful subjects for summer and autumn. A few clumps on the rock garden and in shrubbery borders are producing a fine effect at this season.

THE HARDY FRUIT GARDEN.

Apricots here and there have been very good, and now the fruit is gathered any necessary pruning can be carried out. Make the main growths secure to the wall, and where there is room for extension tie new shoots in their full length. Others are reduced to three or four eyes. Sweet cherries may also be pruned. The pear crop is excellent, but where blackbirds and tits are troublesome it will be necessary to protect the crop. Wall trees can be covered with nets, also small specimens growing by the side of walks in the kitchen garden, but with large examples this is not possible. Here the finest fruits should be covered with muslin bags.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE KITCHEN GARDEN.

Spring Cabbages.—To have plants strong enough to withstand the variable climatic conditions of northern localities they require all the attention hitherto mentioned. All being well they are fit to plant in their permanent quarters now. Did the seasons permit it my choice of a site would be the ground cleared of onions, for the reason that such is sufficiently well nourished meantime, and firm owing to the spring preparation for earlier crops. But the rotation differs according to locality, and in lieu of this the cabbages are planted on an early sunny border following the early potato crop. The preparation consists merely of levelling the ground and, contrary to custom, no manure is given owing to its unfavourable mechanical effects on the soil, and I prefer to feed the crops the following spring when the plants are making new growth. A distance of 18ins. each way is a good average to plant most of the varieties. Lift with good balls attached, replant firmly and water if necessary.

THE FRUIT GARDEN.

Work in the fruit quarters can be carried on as opportunity permits by attending to loganberries in the matter of cutting out old fruit canes and other such cultural points, as suited to raspberries, as required. The loganberry, while not the most delectable of preserves, differs from most, and can be appreciated for this and the fact that it is such an accommodating plant, annually yielding large crops with small consideration as to soil and situation.

Continue the work in the black currant plantation as soon as the fruit is gathered. This latter is not a toil by any means this year in most places and most disappointing following the prolific promises of early season. Despite the discouragement of such happenings next year's crop is partly assured if the bulk of the old wood is cut out to allow the young growths to acquire all the benefit possible from exposure.

Include in the good work another and closer search among the gooseberry bushes for shoots having the tips coloured chocolate brown. These will mainly be found in the centres of the bushes and as succulent soft shoots of the current year's growth. This will generally be recognised as the winter form of American gooseberry mildew, bearing spores which germinate the following spring and produce the white or summer mildew. Such shoots should be carefully cut out and burned, and the labour will not be lost if all the bushes are given a spray with the paraffin emulsion-liver of sulphide wash at full strength.

The Fruit Room.—As various ills develop on fruit in storage, with succeeding evil consequences, prepare the fruit room for the reception of apples, etc., by washing down all stages and supporting woodwork, and limewash the walls. As apples readily absorb any extraneous flavours, this should be done early, allowing the room to regain its neutral atmosphere by the admission of plenty of air.

Doune, Perthshire. W. MCCARRELL.

CATALOGUES RECEIVED.

Messrs. D. Stewart and Sons, Ferndown Nurseries, Wimborne, Dorset. A special catalogue of bulbous and tuberous-rooted plants. A good list of liliums is given.

Messrs. V. D. Clements and Co., 12, Stockton Gardens, Tottenham, London, N.17. A classified catalogue of selected Dutch bulbs.

Messrs. J. Waterer, Sons and Crisp, Limited, Twyford, Berks. Three excellent and well compiled catalogues have been received from this firm. Their catalogue of rhododendrons, conifers and ornamental trees and shrubs is particularly interesting, and includes a large collection of plants. Good illustrations and careful descriptions are given. Bulbs and tuberous plants of all kinds are grouped together in another catalogue, and attention has been paid to the sections on bulbs for forcing and for naturalising. The fruit and rose planting season will soon be upon us, and those who intend planting would be well advised to write for this firm's catalogue of roses and fruit trees, in which there is considerable useful information.

A GRASS LAWN TENNIS COURT

A METHOD OF CONSTRUCTION.

IN laying out a lawn tennis court, before commencing actual work one should go carefully over the space at one's disposal for the purpose, in order to satisfy oneself as to the nature of the soil, the drainage and the elevation. Next, the actual surroundings should have consideration, for these, if unsuitable, would be likely to spoil an otherwise passable ground. Rows of high trees, for instance, would detract from the light, an essential to a good game. A strong afternoon sun bearing direct upon the service line makes a really good game an impossibility; therefore, in laying out the actual court, it should be so arranged that the sun falls upon it crosswise. Placed in such a position, neither opponent will have an advantage over the other in regard to light.

It would seem an easy matter to enclose a piece of fairly level meadow and to turn it into a tennis ground by rolling and constant cutting. But in reality this is, in the long run, costly and disappointing, the better plan being to spend more time on it and to do the work thoroughly.

The proper time to commence this work is in the fall of the year after rain had set in and when suitable labour is available. Over fifty years ago my father, being an enthusiast, enclosed a piece of meadowland and made an excellent ground during the winter with odd labour from the farm.

To begin with, the cheapest way to remove the turf is to use a plough with the breast removed and with a broad share. This will cut the sod 2ins. thick ready turned over for removal. It should then be cut into lengths of from 2ft. to 3ft., wheeled to convenient heaps at the lower side of the court, and there left until the ground is levelled. Levelling ought to be done carefully. But for this purpose all that is necessary is a number of stout pegs. Take the centre of the ground to be worked, drive the pegs in in a straight line. A string stretched taut from one extreme peg to the other will show whether or not all the pegs are of the same height. From this row of sticks the string should be stretched at right angles from the highest point of the ground to the lowest, where pegs again must be driven into the ground to a height corresponding with that of the line of pegs in the middle. In the width of a full-sized court, *i.e.*, 36ft., there may be a drop of, say, 4ft., therefore 2ft. of soil would have to be removed from the topmost side and placed on the lower. The easiest way to effect this removal is by the use of the plough, if available. It will turn up the soil to a depth of from 6ins. to 8ins. or even more, ready for the farm cart, hand truck or barrow. When tipping the loose soil, however, care would have to be taken. It should be tipped down firstly on the extreme outer edge of the court and well packed together; the freshly moved soil should also be banked up quite 8ins. higher than the actual level desired in order to allow for sinkage. The entire ground should then be allowed to settle during the winter; or, if it is thought advisable to complete the ground before winter sets in, the turf would have to be replaced without delay. In the latter case, it would be necessary before relaying the turf to fill in any holes with extra soil. The lawn should then be well rolled. As soon as the surface is fairly level the machine, with knives set high, ought to be put to work, and kept at work until well on into December; in fact, so long as the weather permits. The more the machine is used the finer will be the turf in the spring, and the sooner work commences on the ground after Christmas the better.

If expense is no object, then I strongly advise excavating to a depth of 2ft. and of using 18ins. of clinkers as a bed before putting down the soil and then the turf. If the ground is required to be used as soon as possible, turf would be best; but seed sown on a good bed and carefully tended make, in the long run, a better court.

A good court is often spoiled by bad surroundings; the grass around it should be close trimmed, as also that about the fence. If there should be cattle in the field adjoining, struts nailed on to the fence posts at intervals, projecting at least 1yd. from the fence itself, and supporting a row or so of barbed wire would prevent stock from doing a good deal of damage.

Hard courts are being used now all over the country. Play on these undoubtedly is faster. It is sometimes claimed that when once laid down there is no expense attached to their upkeep. The latter idea is, however, erroneous. Hard red courts should be well watered before being used, otherwise the surface is soon spoilt, while after the game is over they need both the wire mat and the roller to level the surface; and, after all, what looks better in the summer than a piece of good grass ground well cared for?—HARRY DANES.

"The fairest flowers of the season are our carnations."—SHAKESPEARE.

CARNATIONS

FOR EVERY GARDEN AND GREENHOUSE

Built to resist the Ravages of Time

TO be thoroughly efficient a Glasshouse must be so constructed that it will resist the rigours of all phases of our variable climate. Rain or sun, wind or frost—it must be impervious to the effect of each.

The most convincing testimony to the work of Duncan Tucker & Sons, Ltd., is the numerous structures designed and erected by them throughout the country.

Well-nigh one hundred years of experience are behind Duncan Tucker's work; it is this specialised knowledge you acquire when you enlist their aid.

If you want distinctive work—yet built *to last*—you need their services.

¶ If you want a Garden Frame, Duncan Tucker & Sons, Ltd., can supply one to meet your needs. There are models for every imaginable purpose, constructed with the care and experience for which Duncan Tucker's are noted.

The prices are the lowest possible, consistent with good workmanship.

Write for full particulars.

"FERRY" BRAND
Regd. Trade Mark

BULB MANURE is both a PLANT FOOD AND A SOIL PEST DESTROYER

The "Ferry" Bulb Manure is the result of many years of experiment where bulbs are grown to perfection. It is composed of all the constituents required for the healthy growth of bulbs. It acts as a soil pest destroyer, and ensures freedom for the bulbs from all insect and fungoid pests, which are the cause of so many failures.

In the open, use 2 to 3 ozs. per square yard when preparing the soil, for pots work ½ to ¾ lb. to each bushel of soil.

PRICES—Carriage Paid, for cash with order—

7 lbs. **2/-**; 14 lbs. **3/9**; 28 lbs. **7/-**; 56 lbs. **13/-**; 1 cwt. **22/-**

BURPEE'S NEW SWEET PEAS

ROYAL BLUE.

This is undoubtedly the brightest of all the dark blues. It lacks the dull colour of existing varieties, for it has life and brilliancy and so leads the way in this section. It is of good size, vigorous habit, and most prolific in fours. Royal Blue, with its great advance in colour, will be eagerly welcomed by all lovers of Sweet Peas.

GLADNESS.

The soft coral pink of Gladness is somewhat intensified by a suffusion of rather deeper pink towards the base of the standard and wings. The colour may be described as geranium pink. The exquisite delicacy of colour is further enlivened by the lemon keel which greatly enhances the beauty of the flower.

DELIGHTFUL.

This great novelty is a distinct new colour, a rich terra cotta cerise suffused orange, or soft scarlet red. It is so bright in its glowing beauty that it is at once the most appealing of all the richer toned varieties. In addition to its colour, Delightful has all the qualities which go to make a first-class variety.

Buy them from your Seedsman. Packet of 15 Seeds, 1/-

HEWITT'S FAMOUS DELPHINIUMS AND ROSES. Catalogue now in distribution. Please write for one.

HEWITT'S GARDEN SEEDS.—Catalogue of thoroughly reliable tested Seeds, free on application.

HEWITT'S BULB CATALOGUE NOW READY containing the choicest and inexpensive Daffodils, Tulips, and other Bulbs. "Order early and plant early" so as to avoid disappointment.

HEWITT & CO., LIMITED (of Delphinium fame), 6, Solihull, Warwickshire.

IRON AND WIRE FENCING FOR GAR-DENS.—Ornamental Iron and Wire work of every description. Catalogue G. 156. Iron Fencing and Tree Guards. Catalogue G. 65. Wood and Iron Gates. Catalogue G. 163. Kennel Railing. Catalogue G. 86. Poultry Fencing. Catalogue G. 70. Ask for separate lists.—BOULTON AND PAUL, LIMITED, Norwich.

A CATALOGUE of gardening books will be sent free on application to "COUNTRY LIFE," LIMITED 20, Tavistock Street, Covent Garden, W.C.2.

SWEET PEAS AND HOW TO EXCEL WITH THEM. By HORACE WRIGHT, 9d. net, by post 11d. Published at the Offices of "COUNTRY LIFE," LIMITED 20, Tavistock Street, Covent Garden, W.C.2.

HAVE YOU BOUGHT "The Pruning of Trees and Shrubs," by W. Dallimore, Assistant at Kew? Fully illustrated. 4s. 6d. net; post free, 4s. 9d. From all Booksellers or direct from the Publishers, DULAU & CO., LTD., 34, Margaret Street, London, W.1.

DOBBIES' FAMOUS BULBS, SCOTCH ROSES and SWEET PEAS for Autumn Sowing. Catalogues free on mentioning THE GARDEN.—DOBBIE & CO., LTD., Edinburgh.

SEWAGE DISPOSAL FOR COUNTRY HOUSES.—No emptying of cesspools; a perfect fertiliser, no solids; no open filters; perfectly automatic; everything underground. State particulars.—WILLIAM BEATTIE, 8, Lower Grosvenor Place, Westminster.

POLYANTHUS NARCISSUS.—Scilly White's, 10/- 100, £3 10s. 1,000. Empress Daffodils, same price.—A. LEON, St. Mary's, Scilly Isles.

RARE PRIMULA AND ALPINE SEEDS from large (2,000) collection. Also seedlings and plants. Lists free.—REV. J. F. ANDERSON, Glen Hall, Leicester.

GOLD MEDAL DAFFODILS — CHOICE TULIPS, &c. List on application.—THE WELSH BULB FIELDS, St. Asaph.

CHEAP GOVERNMENT WIRE ! ! !—Ideal for training fruit trees, peas, beans, hops, arches, greenhouses, tomatoes, logans, tying, fencing, etc. Strong, flexible, steel-stranded and waterproof covered. Several thicknesses from 19/6 per mile (full 1,760 yds.). Small lots quoted. Post card to-day for free samples and list of 300 bargains.—GREEN'S GOVERNMENT STORES, 69, Albert Street, Lytham.

LOOK ! TANNED GARDEN NETS.—All orders dispatched same day 25yds. by 1yd, 2/-; 25 by 2, 4/-; 25 by 3, 6/-. Odd netting for bushes, 6lbs. for 2/6. All carriage paid. Any sizes supplied. Also Tennis Boundary Nets.—MOORE AND CO., Net Works, Rye.

RIVERS' FRUIT TREES, ROSES, VINES, Figs, Oranges and Orchard House Trees are of first-class quality and a large and select stock is always on view. Inspection invited. Price list post free, on application.—THOS. RIVERS AND SON, LIMITED, The Nurseries, Sawbridgeworth, Herts.

ROCK PLANTS AND ALPINES, Dwarf Conifers, Flowering Shrubs for the Rock Garden, Herbaceous Plants, Montbretias, etc. Catalogue free, ready shortly.—SHEPPARDS, Shawhurst Nursery, Hollywood, Birmingham.

FLAME FLOWER. (Tropæolum speciosum) Extra strong established pot plants of this loveliest of scarlet flowered perennial climbers ready for planting any time now 1/- each, 6 for 5/-, 12 for 10/-, carriage paid for cash with order.—CLARENCE ELLIOTT, LIMITED, Six Hills Nursery, Stevenage, Herts.

INDIAN ORCHIDS.—12 grand fl. sorts, 25s.; 6 sorts Aerides, 23s.; 12 sorts grand fl. Dendrobiums, 35s.; 6 sorts Vandas, 20s.; 6 sorts Cymbidiums, 24s. Cash. All paid in U.K. List free.—CHANDRA NURSERY, P.O. Rhenock, Sikkim (Bengal), India.

HARDY ROCK PLANTS.—700 varieties. Catalogue free.—ALPINE NURSERIES, Stechford, Birmingham.

THE DOG: MAN'S FIRMEST FRIEND.—How to choose and care for him, by A. CROXTON SMITH. A copy of this helpful booklet on the housing, breeding, feeding and care of dogs will be sent post free on receipt of 11d., addressed to The Manager, "COUNTRY LIFE," LIMITED, 20, Tavistock Street, Covent Garden, W.C.2.

GREENHOUSE PAINTING AND GLAZING —"Vitrolite," superior to White Lead Paint, 18/6 per gallon, cans extra. "Plastine," the Imperishable Putty, 32/- per cwt., kegs extra; 7lb. tins, 4/-, post free; 14lb. tins, 5/6 each, carriage extra, tins free.—Full particulars from W. CARSON AND SONS, Grove Works, Battersea, S.W.11.

WARNING!

SPECIAL STATEMENT BY RYDERS, ST. ALBANS

We strongly advise all Bulb growers to apply at once for Ryders' 1926 Bulb Catalogue, now ready, for distribution and on no account to place their order for bulbs until they have had an opportunity of comparing Ryders Prices with those of other leading British Bulb Merchants.

Owing to large purchases Ryders have once again secured the pick of the new season Bulbs and are able to offer first grade bulbs at extremely favourable prices, in addition to Special Collections at Special Prices which are a practical and money saving feature of the new Bulb Catalogue.

We warn our Customers to ignore the many tempting Bulb Offers now being posted from abroad. Many such bulbs are of inferior quality and are likely to cause intense disappointment when flowering time arrives.

Make sure that your bulbs are reliable and true to strain. Buy Ryders Beautiful Bulbs at Popular Prices.

RYDERS 1926 BULB CATALOGUE

(fully illustrated)

The Ryder Bulb Catalogue includes a full list of all the popular and new varieties, and is a comprehensive guide to Bulb growing. It is fully illustrated.

HINTS FROM OUR READERS

THE growth of gardening in the British Isles increases the amount of our information on horticulture. After all, this is obvious, since the more plant growers there are and the more people there are working on a subject the more widespread becomes the common experience. The horticultural Press and books on gardening try to supply all the information available, but from experience we know that there are many valuable hints and tips that readers of THE GARDEN treasure. These are results of personal observation and experiment.

There is no hobby that is so unselfish as horticulture. Therefore, THE GARDEN asks its readers to give freely of their store of knowledge for the assistance of gardeners in general. It has, therefore, been decided to offer a

PRIZE OF HALF A GUINEA

a week for the best original hint published each week, and to pay 5s. for all others published. These hints must be the result of personal observation and experiment, and may consist of any information on horticultural matters. For instance, some readers may know a short cut in the propagation of a plant; others a method of growing a supposedly difficult plant. Other suggestions are a particular colour scheme, a new way of mending a lawn, how to remove a garden pest, a fresh way of arranging a vase, how to keep weeds down on a path, a new way of cooking fruit, a different situation for a plant, an idea for a time-saving tool. There are hundreds and thousands of hints which will assist the gardener. Will you send in your quota to help the gardening public?

HERE ARE THE ONLY RULES.

1.—Half a guinea will be paid for the best hint published each week.
2.—Five shillings will be paid for all others published.
3.—All hints must be sent in on a post card addressed "Hints," THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.
4.—Only one hint per post card, and no hint may exceed 150 words in length.
5.—No hints, whether published or unpublished, will be returned.
6.—Payment will be made on the 7th of each month following publication.
7.—The first issue to contain these hints will be that of September 25th.

By this means we hope that much information hitherto unobtainable will be supplied by our readers for the common weal.

THE WATER LILY TULIP

WHEN making out the bulb order this season, there is one tulip which ought to be included. It is one which, although of the most chaste beauty, is seldom seen in the majority of gardens. It may be that its high-sounding name of T. Kauffmanniana spells distrust in the mind of the amateur, or it may be that its charms have not been broadcast. It is one of the tulip species, however, that a gardener should grow, because there are no others like it. With its brilliant colourings of white, yellow and red, and its shapely flowers which unfurl after the fashion of a water lily when fully open, it is well worth a place in every garden. In addition, it is an early flowerer, opening its blooms in March and April if the weather is kind. Its precocity, unfortunately, may mar its beauty if early frosts are prevalent, and it should be given a corner where it will not be unduly hurried into flowering, yet one where it will receive all the sun of early spring. A border in front of a south-west wall is ideal. On the whole, it is fairly hardy, and with a little care it will do equally well in the north as in the south. One of its chief charms lies in its dwarf and neat habit. It only reaches some 6ins. in height, and more often than not about 4ins. The flowers stand well out from the foliage, and when fully open it has every appearance of a water lily. The bulbs may be planted from now onwards, in good loamy soil, about 2ins. deep. When planting, it is advisable to apply a dressing of sand, which keeps the bulbs dry and prevents rotting. It looks well as an edging to a narrow spring border, either by itself or in association with other spring-flowering bulbs, such as muscari or chionodoxas.

A TULIP WORTH GROWING.

A FAVOURITE SUMMER FLOWER

IN RECENT YEARS GREAT IMPROVEMENT HAS BEEN REGISTERED IN THE DEVELOPMENT OF THE PENTSTEMON—ONE OF THE FINEST OF OUR LATE SUMMER FLOWERS. IT IS THE FLOWER FOR THE AMATEUR. CUTTINGS TAKEN NOW WILL FORM GOOD FLOWERING PLANTS FOR NEXT SUMMER

AS decorative plants the pentstemons possess many advantages over other plants for the flower garden, herbaceous and shrubbery borders. They are as beautiful as they are suitable for any position, because they are in perfection from the middle of June until the autumn frosts stop them, a quality that the majority of plants used for the embellishment of our gardens do not possess. In addition to this, their spikes of blooms are invaluable for cutting; while their cultivation is easy, for they will thrive in almost any soil and position.

Pentstemons are easily propagated by seeds and cuttings, the former being freely produced; but plants raised from the latter are preferable where neat, even arrangements in beds and borders are needed. It is most interesting to raise a few seedlings when the seeds have been saved from choice varieties, and although they may prove rather uneven as regards height, they make a very effective bed or border.

It is advisable to grow a few from seeds annually, as some very beautiful and distinct varieties may be obtained by this means. Sow the seeds on the surface of the soil in pans and boxes in heat early in the year, and when the seedlings are large enough prick them off singly into other boxes, and then grow them on quicky until they are ready for planting out in frames and treating the same as those raised from cuttings. It is necessary to hasten them so as to get them as large as possible before the time for planting outside, for the larger they are when planted out the sooner they commence flowering.

From early plants cuttings are generally plentiful towards the end of August and early September. The sooner they can be obtained after this date the better, so that they will become rooted and established before winter. Vigorous cuttings from 2ins. to 3ins. in length should be selected and inserted thickly together in a frame, or where old lights can be placed over them. The bottom of the frame in which they are to be inserted should be firm, and on this must be placed 3ins. to 4ins. depth of old potting soil, surfaced with sand. After insertion a good watering should be given, keeping the frame closed and shaded until they are rooted, when abundance of air may be admitted whenever the weather is favourable.

The young plants will require very little water during the winter, free ventilation only being needed. During severe weather the protection afforded by the lights will be ample, for if the soil becomes frozen no injury results; but this I endeavour to avoid by placing an old mat or two on the frame.

Some cultivators place their plants as soon as rooted in 3in. or 4in. pots, but, judging from experience, this is really unnecessary and only a waste of labour. When in small pots the plants are very liable to become dry at the roots or to suffer from insufficient root-room

A LATE SUMMER BORDER OF PENTSTEMONS.

Next year's garden should certainly contain a few clumps in the general border for colour effect.

Digitized by Google

before they are planted out in spring. In early spring, about the middle of February, as soon as the young plants show signs of growth, the points of the shoots are pinched out, which will induce the plants to branch and to push shoots from the base. About a fortnight afterwards, or as soon as they commence to break, the plants are lifted and transplanted into frames temporarily prepared for them. The base is made firm, and then soil to the depth of 5ins. or 6ins. is placed in. Any ordinary potting soil will do, provided that a liberal quantity (about one-third) of old mushroom-bed refuse or well decayed leaf-mould is mixed with it. These plants are gross feeders, and grow quickly and luxuriantly in rich soil. They root freely in leaf-soil, and lift well when a good quantity is used in the soil for them. The plants are placed about 4ins. apart, watered if the soil is dry; if not, they are lightly syringed daily and shaded when the sun is bright, until they commence to grow. Abundance of air is afterwards given them, and when the plants are growing freely and strongly the lights are taken off and the frames removed by the time the latter are needed for the protection of other plants.

Pentstemons are hardier than many people suppose, and if grown on the principles detailed they will bear a low temperature without apparent injury. They lift much better than the majority of plants, and if dry weather follows the operations of lifting and planting, one good watering is generally sufficient to start them growing freely. It is surprising how well these plants bear drought, and do not even show the least signs of suffering, when phloxes and many other hardy plants are flagging from insufficient moisture. In order to keep beds and borders gay the old spikes should be removed, because seeds are so freely produced and the plants are then soon exhausted.

There are many excellent named varieties in cultivation which, when massed in small beds or grouped in borders, are most effective; of these, mention may be made of Newbury Gem, in its scarlet, pink and white forms; Southgate Gem, which is an exceedingly fine scarlet form of the preceding variety; Mrs. Leonard Cutbush, a striking scarlet with white throat; Mauve Queen, mauve, throat clear white, edged mauve; Day Dream, a pleasing shade of rosy pink, grand for massing; Autumn Cheer, scarlet, white throat; Miss Baird, rich pink, white throat, large spike, grand flower; and Ivorine, a good white with large flower. JAMES A. PAICE.

PLANTS TO GROW WITH BULBS

ONE often meets garden lovers who remark that they do not "go in" for spring bulbs because their flowering period is relatively short and, in the need for ripening the bulbs, the appearance of the border is somewhat spoilt just at an important time. This objection is one of those half-truths which are often difficult to combat, for we all have experienced seasons when the weather has been so unkind that one has felt that there has not been that enjoyment in the hyacinths and the early Dutch tulips that could reasonably have been expected. Then again it occasionally does so happen that just as the Darwin and cottage tulips are at their best, there has been a sudden burst of a fortnights' sunshine, almost tropical in its intensity, that has so hastened the development of the tulips that it seemed as though they had no sooner disclosed their floral beauty than the petals had fallen and, all too soon, the May-flowering tulips were a memory.

But even so, such seasons are the exception and one feels that a garden cannot be complete without a generous quota of spring bulbs. While there are no practicable means of conserving and prolonging the flowering period of the bulbs in the garden, yet the objection on the score of appearance can be readily overcome by associating the bulbs with selected herbaceous plants and annuals, so that when the otherwise disappointing season may come the flower borders will continue well filled with interesting plants.

When daffodils and narcissi are grown in large quantities, the maximum effect is obtained, as so many charming illustrations in THE GARDEN have shown, by planting broad sweeps of the bulbs in grass, either in the open or in thin woodlands with judicious plantings of bamboos, shrubs, ferns and a few of the bolder herbaceous plants.

In the flower garden proper it has become almost the general practice to associate the bulbs with wallflowers, forget-me-nots and polyanthuses. But while good effect may, and is, obtained with these, their restricted use tends to monotony. There are many other subjects that might with advantage be similarly employed more often than is now the case. To mention a few examples there are the graceful little Phlox setacea (subulata), and varieties which bear a profusion of flowers in various shades of rose and pink; the white Arabis alpina and the equally easy-growing double-flowered form; Iberis gibraltarica; Alyssum saxatile and its varieties, and aubrietias of many sorts, all of which may be safely lifted and planted in the store garden when the bulbs have finished flowering and the flower beds are needed for summer bedding.

A PLEASANT ASSOCIATION OF TALL DARWIN TULIPS AND FORGET-ME-NOTS.

For the herbaceous border the choice is wider, as, among other considerations, the plants to be grown with the spring bulbs may be looked upon more in the light of the regular occupants of the sites. In the front of the border, where the dwarfer Dutch tulips and hyacinths will be planted, the plants already named will, of course, find a place, and in addition use should be made of Adonis amurensis, Achillea argentea, A. tomentosa, A. umbellata, Anchusa myosotidiflora, many of the border pinks, the Oriental hellebores, Tussilago fragrans, Plumbago Larpentæ, Polygonum affine, Stachys lanata and the dwarf veronicas. It will be found that, as a rule, the most effective plan is to associate the daffodils and narcissi with the border plants of prostrate habit, while the hyacinths will be planted with the polyanthuses, forget-me-nots and such, which grow more erect. Objection may be raised to the association of spring bulbs with border plants on the score of root disturbance and consequent injury to the plants when the bulbs are lifted to be spread out to complete their ripening. But if the narrow bulb trowel is used the loss of the few roots that may be injured will be of no moment and there will be no apparent difference in the well being of the plants. Generally it is only the narcissi among the bulbs planted in the front part of the border that are worth lifting for preservation. If the hyacinth bulbs are left in the ground the majority will survive the following winter, and during the next spring will, instead of one compact spike, generally throw up several more slender spikes of distinct grace and beauty. Or, of course, they may be discarded and new bulbs planted again in the autumn.

The place for the taller Darwin and cottage tulips, as well as various narcissi,

Digitized by Google

is more towards the middle of the border, where there will be many opportunities for effective combinations. The yellow tulips and also the Poet's narcissi are especially effective when planted among peonies of officinalis type and varieties which have rosy-purple young shoots. They also associate well with the graceful foliage of Dielytra (Dicentra) spectabilis and may appropriately be planted between the tufts of Campanula persicifolia and any others of similar habit.

Except the Darwin tulips, which flower best when planted at the end of November, it will be found that, as when grown in pots, it is the early planted bulbs that always give the most satisfaction. A. C. B.

INDOOR DAFFODIL CULTURE

This is the second of the short series of articles on bulbs which was prepared by the late Rev. J. Jacob for THE GARDEN *a short time before his death.*

THERE are two ways in which daffodils may be grown in greenhouses and rooms. One is the orthodox system of pot culture and the other is a revival of an old practice which was advocated so far back as 1734 when Sir Thomas More, Bt., narrated as an appendix to "The Flower Garden Displayed in above four hundred curious Representations" (London, 1734) his experience in growing bulbs and certain fibrous-rooted plants in "Basons and in Flint Tumbler-Glasses," which were wider at the top than the bottom, on corks with holes cut to receive the bases of the bulbs and with water as the rooting medium.

From a long experience I have found that any good light garden soil which is fairly porous and which is well drained grows daffodils very well. As a counsel of perfection I would advise such a mixture as the following: two parts good virgin loam, one part coarse silver sand and one part old decayed leaf-mould, the whole mixed well together and a small quantity of ground bone meal added. For calathinus and triandrus I use a more porous soil consisting of two parts of very coarse silver sand, one part of good rich loam and one part of old decayed leaf-mould or coconut fibre, and when potting fill the pots about a quarter full of broken crocks. These are stood in saucers, which are constantly kept filled with water, none being given from the top except every now and again. These are never buried under any sand, ashes, etc., to start their growth. I have dwelt upon the treatment of these Angels' Tears daffodils because they are particularly lovely when grown under the refining influence of glass.

W. P. MILNER, A USEFUL DAFFODIL FOR POTS.

With regard to the number of bulbs in a pot opinions differ. For the purpose of exhibiting at a show the usual practice is to cram as many as can be got into the pot, and no doubt a big mass of bloom is the result. Personally, I do not care for such a crowded mass of flowers for ordinary house decoration, and some such proportion as three Emperors in a 5in. pot or five in a 6in., or, say, double the quantity of W. P. Milner in the same-sized pots, would be much more pleasing.

The earlier a bulb is potted the earlier it may be in bloom. The end of August or early September is none too soon for the first batches. No satisfactory Christmas or New Year's bloom can be had unless this is done. On the other hand, I have planted bulbs on February 3rd and had flowers from them in mid-April, but the stems were weak and the size of the bloom was small. Early planting is a golden rule and should never be broken except in very occasional circumstances.

After planting, the pots should be buried to the depth of 5ins. or 6ins. in fibre, ashes or sand, or stood in a darkened cold frame until the bulbs have made good roots and from 1½ins. to 2ins. of top growth. They may then be placed in a cold frame where severe frost can be excluded and light and air given whenever the weather is mild. This will act as a store room from which supplies for introducing into heat may from time to time be obtained. If no frame is available, the pots may be left under their covering outside until wanted. It is impossible to go into all the details about their introduction into the greenhouse and the amount of heat necessary. As a general principle it is well to remember that the lower the temperature that is maintained, the longer the blooms are on the way, and that more time must be given for growth if flowers are wanted on January 1st than on March 1st. I try to keep a temperature of between 45° to 50°, rising in the sun to 60° and dropping on very cold nights to 40°. With this heat it will take five or six weeks to get flowers on January 1st and only three weeks or even less to have them on March 1st.

The details of cultivation consist in giving as much air as possible on all available occasions, keeping an equitable moisture in the pots and avoiding, as much as possible, violent fluctuations of temperature.

One is frequently asked about the treatment after flowering. Several courses are open. The bulbs may be turned out carefully from the pots if no leaves have been cut and planted in an out of the way border just as they are, or even in grass. Here they will gradually recover, but it will take two years at least before they are quite strong again. If valuable bulbs have been employed and if they have not been brought into bloom before, let us say, Valentine's Day, the pots should be kept as they are and, if possible, in the same temperature (45° to 50°) in which they have bloomed. If they are kept constantly watered and fed with weak soot water or very diluted cow manure water and gradually allowed to die off, good sound bulbs will be formed, which may be counted upon to flower again the next year if planted outside.

Digitized by Google

CULTIVATION IN BOWLS OR OTHER RECEPTACLES WITHOUT DRAINAGE.

It is not generally known that any rooting medium may be employed. One of the best displays from bulbs grown entirely from the start to the finish in a dwelling-house came from bulbs planted in *light* garden soil. Silver sand is equally as good. For those who are unable to get suitable soil no doubt the ready-made mixtures which are sold by bulb dealers are most useful. Here, again, coconut fibre refuse or well broken up peat moss litter may be equally well employed. The results are identical. When soil or sand is used it will be found the bulbs bloom from five to six days in advance of those in fibre. In filling the bowls it is well to add broken pieces of charcoal about the size of a Kentish cob nut to the fibre or soil, as their presence tends to keep the medium in a good and sweet condition, without which root action will not be what it should be and the health of the plants will suffer. The fibre itself should be *nicely moist all through*, but not soaking wet. The operation of planting in bowls is much the same as in pots. Matters should be so arranged that when all is completed the top of the bulbs should be level with the top of the fibre. This should be made firm round them by gentle pressure in order to prevent the bulbs lifting and turning over on one side. In the early stages of growth it is important to keep a sharp look-out for any signs of their getting out of place. When this happens they must at once be carefully put straight.

The after-cultivation consists in the bowls being placed in a cool, dark, airy place indoors or in a darkened frame outside for a sufficient time for a good root formation, which is just as important for these as it is for plants in pots. When the bowls are filled with roots and when about 2ins. of top growth has been made, they must be placed in light. A cold frame from which frost is excluded, or if this is not available a light, airy window in a room without fires make a store place from which bowls may be taken into heat as required.

It is important for the welfare of the plants to keep the medium neither too wet nor too dry. To guard against the first it is well to turn the bowls carefully over on their sides, holding the bulbs and fibre in position by the outstretched fingers thrust across the top of the bowl. Dryness must be tested by feeling with one's finger among the roots. It may be well to state that any earthenware or china receptacle may be employed, but that the plainer they are the better the whole looks at flowering time. My parting word is, avoid decorated receptacles for growing bulbs in without drainage.

NOTES OF THE WEEK

THE CHEROKEE ROSE.

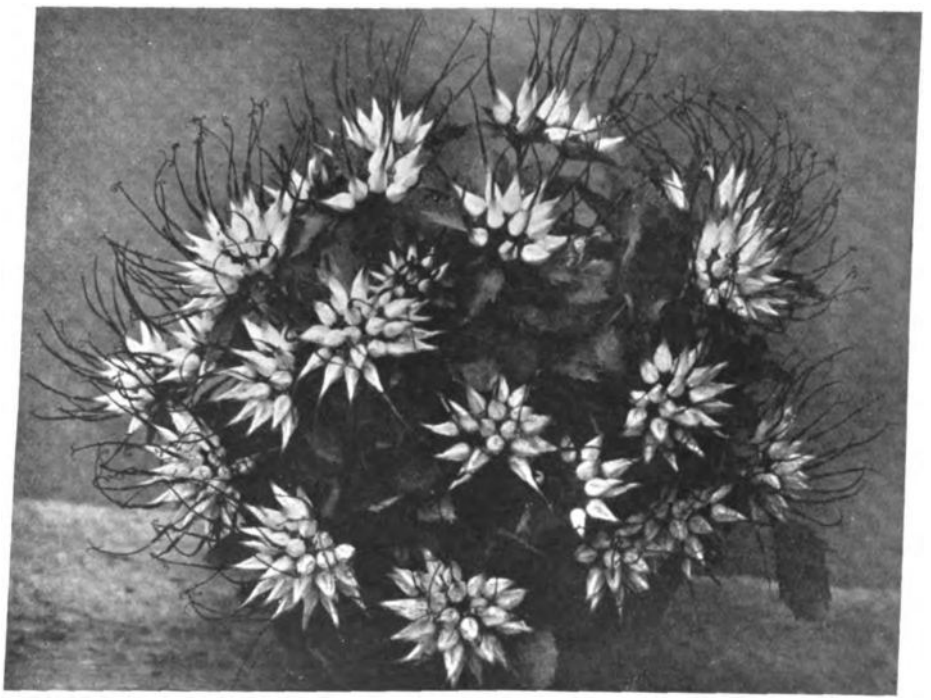
OWING to its comparative tenderness, the Cherokee rose, Rosa lævigata, is little seen. This is not suprrising, as it is unsuited for growing anywhere except on a warm wall, and that in a very mild part of the country. I know of one very good garden in the south-west of Scotland, close to the sea, and with a climate of exceptional mildness, where the Cherokee rose flowered well for a number of years against a warm south wall. It is a truly handsome rose, with fine glossy foliage and very large single pure white flowers. It is worth growing by those who have a favoured climate for the British Isles and a good wall against which to plant it.—S. ARNOTT.

PHYTEUMA COMOSUM.

ONE of the strangest looking alpine flowers in cultivation is Phyteuma comosum, and, although at the same time this plant has great beauty, it is so comparatively rare in gardens that one can never quite get so used to its oddness as to appreciate its beauty fully.

Naturally the plant is a cliff dweller, fairly plentiful throughout the Dolomites, and not difficult to grow in the garden. In case you should be going to the Dolomites, I will give you not only a hint or two about collecting P. comosum, but at least two stations where you may see the plant without danger or difficulty. First, I will tell you where you may find the second—no, the third, finest specimen in the world. I believe Mr. Mark Fenwick has the second finest. The third finest specimen grows close to the road on the left-hand side as you go up from Riva to Storo, a mile or so out of Storo. (This, by the by, is hardly the Dolomites, but it is not far away.) Farrer and I saw it there some sixteen years ago and we agreed to leave it there. I saw it again several years later as I passed in a motor. It is a superb specimen and you cannot miss it. But having divulged the secret, I trust no one will go and attempt to take this plant. If you try you will quite certainly fail, even with ropes and ladders, and you will almost certainly break your neck. So much for the third best specimen. What about the best you ask? At a recent R.H.S. show I exhibited a pan specimen of P. comosum from my alpine house, and Mr. Mark Fenwick told me that he had always thought his own specimen was the finest, but that he had to confess that mine beat it. This plant of mine was given an award of merit. Its photograph accompanies these notes and saves me much trouble in a vain attempt to describe the strange mauve and violet bottle-shaped flowers. The other station I can give for the phyteuma is not quite so far off the beaten track, in fact, it is at that popular centre of the Dolomites, Cortina. Here two great and very comfortable hotels dominate the hillside just above the town. Stay at either of these and it is an easy stroll, between tea and dinner, up through the woods immediately above the hotels to a range of limestone cliffs.

Daphne Cneorum dwells in these woods, and the lovely Rhodothamnus chamæcistus at the foot of the cliffs, while in the cliffs themselves grows P. comosum in fair quantity. And you can get at the plants without danger of breaking your neck, though in getting roots from the steel-hard rock you are likely to break your trowel, your knuckles—even your heart. But the plant is not difficult to establish even if you do not secure the whole root complete—which you seldom will. Slugs, with their almost uncanny intuition for the catalogue value of alpines, love P. comosum; but slugs apart, the plant is not difficult to grow in the rock garden. A natural hole in a big limestone rock in which some wild plant formerly grew is the ideal place for it, or failing this ideal, a deep crevice between two rocks. In the alpine house it seems to flourish better than in nature. In a garden I visited recently I saw a flourishing colony of P. comosum growing in a cold frame in a bed of deep limy sand and surrounding the elder plant grew a family of a dozen or two lusty self-sown seedlings. It is such sights as this that make



PHYTEUMA COMOSUM, AN ALPINE OF STRANGE BEAUTY.

a nurseryman's eyes glitter! My host stayed with me the whole time.—CLARENCE ELLIOTT, *Stevenage.*

ROSE HEDGES.

A ROSE hedge is a charming addition to any garden where there is space for it. Though roses are not suitable for a boundary fence, there are many places where they can be used instead of uninteresting shrubs, as, for instance, a dividing hedge between one part of the garden and another. In some old-world gardens there are hedges of clipped yew. These form an excellent background to a lower and less formal hedge of roses, the dark, sombre yew serving to throw up the lighter beauty of the foliage and blooms of the roses.

Up to now, the common sweet briar has generally been planted for hedges; but several other roses, including some of the climbing varieties, can be used for this purpose.

Among the dwarf-growing kinds, nothing is more compact than the Scots roses, all of which are suitable for a hedge round the rose garden.

Rosa Hugonis grows well and produces bright yellow single flowers towards the end of May. It forms a large bush, and is easily increased by cuttings taken in the autumn. The many-coloured polyantha roses are excellent for low hedges, and the taller-growing R. altaica can also be used. The latter bears yellow-white flowers with deep yellow centres, and is very free-flowering; while the old-fashioned pink China monthly rose is very hard to beat for this purpose, as it blooms continually throughout the summer and autumn.

There is nothing more fragrant than a sweet briar hedge; its scent after a shower of rain is delightful. To be really effective the hedge should be about 5ft. in height and the same in thickness. Unlike most roses, sweet briars do best in a light, sandy soil, as they dislike clay or heavy, wet land.

All the Lord Penzance hybrids are of strong growth and suitable for hedges. Meg Merrilees, a bright crimson; Flora McIvor, white; and Julia Mannering, a pink, are particularly good. For an impenetrable hedge they can be grown up to 10ft. in height and nearly as much through; while for a lower hedge they may be planted in single or double rows about 4ft. apart. Cut them back hard the first year; but later on, only thin out the old wood and any twiggy growths, and bend the long flowering shoots as nearly horizontal as possible, so as to limit the height to about 4ft. or 5ft.

Of course, hedges of this description cannot be trimmed as closely as those formed of shrubs on which the shears are used. But they can, and should, be judiciously pruned at the proper season. If the flowering branches are tied in here and there, the hedges will be kept fairly true to the required shape. To encourage the young growths to develop and prevent the bottom of the hedge from getting thin, all the old wood that has flowered should be cut out at the base.

Before planting the rose trees, the ground should be thoroughly prepared by deep digging or trenching, and some good manure or decayed vegetable matter added to the lower spit.

As a rule, roses do well on heavy soils, to which such materials as bonfire ash, mortar rubble or sand can be added. In all cases a top-dressing of manure is beneficial.

The best time for planting roses is in October and November, or in February and March; and it is a mistake to bury the roots too deeply.—HAZEL ALLAN.

THE CHARM OF A ROSE HEDGE: UTILITY AND BEAUTY COMBINED.

CASSIOPE TETRAGONA.

STILL frequently known as Andromeda tetragona, the title given to it by Linnæus, this charming little member of the erica family deserves the fullest consideration of the cultivator of alpine flowers. It is not only attractive, but its foliage is evergreen and is pleasing in itself with its imbricated appearance and arrangement in four-angled stems. It is absolutely hardy under ordinary conditions, as it should be, seeing that it is widely spread over both Arctic and Sub-Arctic regions; and I can only recollect losing one plant through weather conditions, and this loss would probably not have occurred had the cassiope been in a less draughty place. It was lost in one of those trying winters of ours, when snow was followed by rain and then by a biting wind and severe frost, which proved too much for a plant in a wind-swept, draughty position. Others in more favourable conditions did not suffer, even although they had not their natural winter covering of snow to shelter them from the inclemency of the season. Given an open position in sandy peat, never allowed to become too dry in spring, summer or autumn, but not in sodden soil, there is no reason why this delightful cassiope should not gladden the owners of many more gardens. And it is a great beauty, only some 7ins. or 8ins. high, if allowed to grow as much, a foot across, and hung with lovely pure white, lily of the valley-like bells of waxlike texture. When of good size it may be increased by division.—S. ARNOTT.

WINTER ACONITES.

STRANGE as it may seem, the average grower of bulbs among amateur gardeners knows very little from practical experience about winter aconites, often the first of blossoms to greet us in the morning of the year. It may be that his eyes have never been gladdened by a sight of a drift of their golden yellow flowers opening in the fitful sunlight of a cold January day. He may have perused some list and glanced casually through the names under "Miscellaneous Bulbs," but Eranthis hyemalis has conveyed no idea to his mind of a dainty little flower which comes at the beginning of the year, and which we commonly call the winter aconite. Perhaps if the "trade" boomed it, or it came under review at some exhibition by the general public, they would want to know more about it; but long before the "light footsteps of the spring" are manifest—indeed, before scarcely any spring flowers appear—these charming winter visitors have fulfilled their mission and vanished. It is a delightful little blossom, nestling in its frill of green leaves, and makes a brave show of gold at a time of the year when there are few other outdoor flowers to bear it company, save only the yellow blossoms

A FINE DARK COLOURED STRAIN OF SCHIZANTHUS.

of the winter jasmine as they hang over the wall. There are several reasons which might be advanced for the growing of these little bulbs in every garden, however small. First, because the flowers are very charming, and come at a time when any bright colour is welcome in the garden; (2) they can be planted in any odd corner, but chiefly round doorways, or where the blossoms can be seen from the windows of the home, under trees, in the rock garden, round steps, at the edge of paths, or on banks among shelter of foliage or grass; (3) once the bulbs have been planted one need not meddle with them for years, as they improve with keeping. Seldom does the weather hinder them revealing their faces, as they will push through snow and show their golden glory. And the final reason why everybody who loves a garden should grow the winter aconite and plant the bulbs profusely is, perhaps, the best. It is the matter of cost.

For about 3s. one may have a hundred of the bulbs, which means that in your garden, long before the spring treasures appear—nay, scarcely have given signs of their presence—you will have in these lowly blossoms more than a hundred golden faces to greet you, reminding you of the passing of winter and that spring days will surely come!—W. LINDERS LEA.

THE BUTTERFLY FLOWERS.

Sow Schizanthus Now.

AMID all the half-hardy annuals grown for greenhouse decoration in spring the schizanthus stands supreme. Well grown plants blossom with astounding profusion, and the colours are so gorgeous as to baffle description; even that popular name, the Poor Man's Orchid, does not do full justice to a collection of handsome plants.

First of all, procure only the very best seed. I specially recommend the Wisetonensis grandiflora strain of Messrs. Blackmore and Langdon, the American hybrids known as Dr. Badger's strain, and the true to colour varieties of Messrs. Sutton; but a good dealer will, for a reasonable price, furnish varieties of superb nature and delightful colours. The retusus types, not so frequently grown in pots, are in my opinion almost equally as good as the others, and room might be found for a few of them too. Except where one or two colours are particularly desired, I advocate mixed seed, for the flowers invariably show a wide range of colours and tints in various markings and combinations.

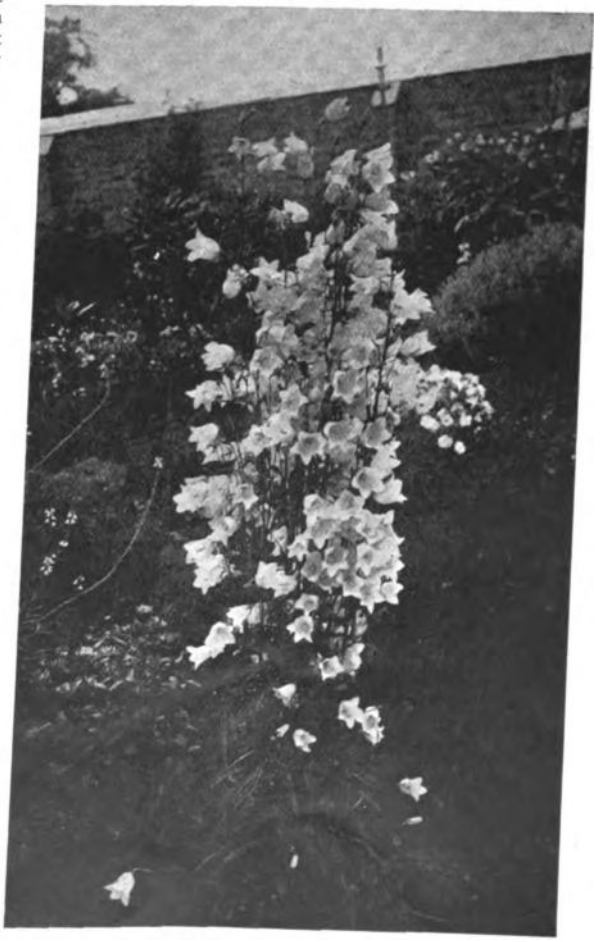
Seed is best sown as early as possible in late summer and germinated in a temperature round about 60° or 65° Fahr.; this can be secured in a frame easily, but shade from strong sunshine is necessary at first. Seedlings appear in a week, and they are then kept near the glass; in fact, at all times is it advisable to grow these plants near the glass, since short sturdy growth is one of the main keys to success. Seedlings are pricked off into boxes in the usual way and again, when sizable, transferred to 3in. pots. Some growers put three plants in a pot; while this can be done with named varieties, it is always better, I think, to keep one plant to a pot. Let the plants remain in the frame as long as possible, for the schizanthus is essentially a cool greenhouse subject. Water regularly, taking care neither to give too much nor too little.

When the plants are 3ins. to 4ins. high, pinch out the tip and continue pinching them as they grow, so as to get neat compact bushes. In February they will be ready for 6in. pots, in which they are flowered. The compost should consist mainly of a fibrous loam, and a little dry cow-manure may be added to enrich it. Pot firmly at this stage, and when roots fill the pots feed twice weekly until buds appear. Shade from strong sunshine prolongs the life of the blossom.—CLYDESDALE.

BELLFLOWERS FOR VARIOUS POSITIONS.

WHEN we bear in mind their all-round capabilities, there are few hardy plants more useful in and about a garden than campanulas, and, in particular, the taller sorts that are such a feature of many gardens. Most of them are free with their blossoms; they will grow in any moderately good soil and thrive under conditions where other plants would barely exist. It is because of this that they do so well in the suburbs of towns. For borders, some of the old and well tried sorts, like persicifolia, the peach-leaved bellflower, and pyramidalis, the chimney bellflower, in both blue and white forms, are well known. In many places they constitute the stock and are largely drawn upon for potting and bringing into bloom early in the year. In addition to the two old standard sorts referred to, one does not forget sorts that are of service in a garden, such as macrantha, with royal purple trumpet-shaped flowers borne on tall spikes; Burghalti, with lavender blue flowers; and grandis, of a rich blue. Telham Beauty, of the persicifolia type, is a tall-growing variety with thin wiry stems, with large single bells of pale blue. Glomerata dahurica, purple, and its white counterpart, the clustered harebell, though only growing about 18ins. in height, is a favourite border plant with many. We owe much to campanulas for their long season of blooming, and this contributes much beauty to a garden from early summer. We cannot forget, too, the claims of sorts of lowlier growth that come to our aid for edging paths and for planting in positions where taller plants would be out of place, such as carpatica Riverslea, with deep blue flowers; pusilla, with shining heart-shaped leaves and pale blue blossoms; and turbinata, yielding a profusion of large individual blooms on quite dwarf plants. There is a great choice in the selection of campanulas open to the would-be grower, and the gardener taking them in hand for the first time will find them easy to deal with. Unfortunately, a number of growers allow the plants to occupy the same spot for several seasons without troubling to divide them, and this accounts for some of the spikes being puny. Nothing is gained by allowing campanulas to develop into large clumps; on the contrary, they, as a rule, take up space rightly belonging to other plants in a border.

Every two years it is best to take stock and divide. It is the individual plant which produces the finest spike and the best flowers. As with the tall sorts, so with the cushion and carpeting sorts; they, too, must be overhauled at intervals to curtail their growth and to thin out the weakliest.—W. F.



THE WELL TRIED CAMPANULA PERSICIFOLIA, A GOOD ALL ROUND BELLFLOWER.

NURSERIES OF THE BRITISH ISLES.—II

MESSRS. BARR'S GROUNDS AT TAPLOW

THERE are few firms which can lay claim to such a long record of service in the interests of horticulture in general and in the growing of bulbous plants in particular as Messrs. Barr and Sons of Covent Garden. One has to go back to the sixties of last century to discover the beginnings of the firm, which was founded by the late Mr. Peter Barr in 1861 under the title of Messrs. Barr and Sugden, by which it was known until 1882, when the name was altered to the present one of Barr and Sons. Originally the firm dealt only in high-class seeds and bulbs, and, soon established a name all over the world. In the early sixties nursery ground was acquired in Garrett Lane (between Lower Tooting and Wandsworth), not far from the famous nurseries of Mr. Robert Parker and Messrs. Rollison and Sons. There, were planted a valuable collection of bulbous plants, many classes of irises, and also the collections of new hybrid daffodils raised by William Backhouse and Edward Leeds, which had been purchased by Peter Barr. A very complete collection of helleborus species was also grown, many of which are now unobtainable.

In 1889 the firm removed their nurseries to Long Ditton Surrey, and old travellers on the South Western Railway must well remember the feasts of colour afforded by the daffodils, tulips, irises and summer-flowering herbaceous plants cultivated at these nurseries. Owing to the encroachment of buildings, Messrs. Barr found it necessary to seek new ground and in 1911 established themselves at their present nurseries at Taplow. From 1861 until the present day represents sixty-five years of continuous service to gardeners the world over. The founder of the firm was one of the pioneers in the horticultural world of last century, and the energy which he showed in the development and improvement of many types of bulbous plants, notably the daffodil, has been and is being still carried on by the present members of the firm. Under the *régime* of the founder, the firm acquired a reputation as the leading growers of daffodils, of which they have since always made a speciality, and year after year Messrs. Barr's present to the daffodil world a number of novelties of considerable merit. Yet their interests were sufficiently wide for them to grow and popularise many other plants, including irises peonies, tulips and liliums, to mention only a few. The interest in irises, tulips and lilies has been sustained and increased, and in addition a flourishing alpine department has been set going, containing many new and rare alpines, as well as the commoner members of the rock garden. In 1910 ground was procured in Cornwall for the purpose of growing the new seedling and better kinds of daffodils. This not only ensures early-flowering, but also a thorough change of soil and climate from Taplow. All along the line it is a record of progress, and the future, we have no doubt, will only add success to past successes.

Lovers of the daffodil should not fail to pay a visit to the nurseries at Taplow during the month of April, round about Eastertime. It is then when the beds are a blaze of all shades of yellow, made all the more attractive by the rise and fall in the levels of the individual beds and the contrasting blocks of colours. Looking along one of the beds, one cannot but call to mind Wordsworth's pen picture of a "host of daffodils waving and dancing in the breeze." They are among the most elegant and graceful of our flowers, and with their delicacy and refinement of colouring they easily take first place among spring-flowering subjects. To see these beds in their full splendour is to convince one that no garden should be without one or two of their representatives. There is, indeed, no flower which so well conveys the spirit and atmosphere of spring as the daffodil.

A SEA OF YELLOW NODDING HEADS.

ANOTHER CORNER IN THE NURSERY.

While the general effect and appearance will fascinate the amateur, the daffodil enthusiast looks for something more. It is he who wishes to know what this and that variety is like, and how it grows and if it is likely to prove a valuable garden sort. These, and a hundred and one other questions, he will find answered for him by a careful survey. A most alluring assortment of varieties is on view, extending from the giant trumpet-flowered kinds to the dainty poetaz and tazetta varieties, and it may be interesting to mention a few individual sorts which appealed to us on our visit this spring. The most noticeable bed was probably that filled with the gorgeous waving plumes of King Alfred. There seems little doubt that this is one of the finest daffodils for ordinary garden purposes which we have. Not only is it desirable on account of its vigour and deep colour, but its flowering period is a long one. Arion, a fairly new Leedsii, is a most distinct and beautiful flower as well as being a neat grower, and is most effective when seen in a drift. Among the other striking Leedsii noticed were the snow white Venus, which is a fine early sort and excellent for association with King Alfred, as both

Digitized by Google

bloom at the same time, and the care-free Lady Godiva.

Among the many fine jonquil hybrids the charming white Fairy Nymph stood out as distinct from its neighbours. Among white trumpets were Mrs. Robert Sydenham, a good garden variety; Peter Barr, the largest flowered white trumpet daffodil, one of the first raised and still one of the best; and Silver Gift, a more recent variety with really beautiful snow white, medium-sized flowers. In the new seedling daffodils there were many interesting flowers on view. One seedling, No. 3853, was particularly striking, and appeared to be a much improved Lord Kitchener. The large and handsome snow white blooms of Viscountess Northcliffe, a triandrus hybrid, were also to be seen in association with many other recent seedlings. The selection offered in these novelties is an extensive one. One other grand garden variety, Bonaparte, a fine yellow incomparabilis, formed a perfect sheet of yellow; while Sunrise looked a good market flower, being a very early red cup. Many interesting hybrids, such as Triandrus × Leedsii and Trumpet × Poeticus, are all good. Silver Fleece, one of the former, being particularly so.

In April, also, many of the early-flowering tulips are to be seen, and the brilliantly coloured Thomas Moore is sure to attract attention. The tulips showed the same care in cultivation as the daffodils, and in the spring of this year were very far ahead.

Messrs. Barr's have long been known for their interesting collection of rock and alpine plants, and many of these are to be seen in company with a number of early-flowering irises for which this firm is also famous. The patches of aubrietias and alyssum, with the kaleidoscopic shades of the new Spetchley polyanthus-primroses, make a vivid colour display in the early months of the year. A noticeable feature of the nursery, and one which will strike many amateurs, is the number of beech hedges, which prove exceedingly useful as wind screens, even in winter; as is well known, the beech holds its leaves for a considerable time. It is a practice which might be well adopted in many a wind-swept garden.

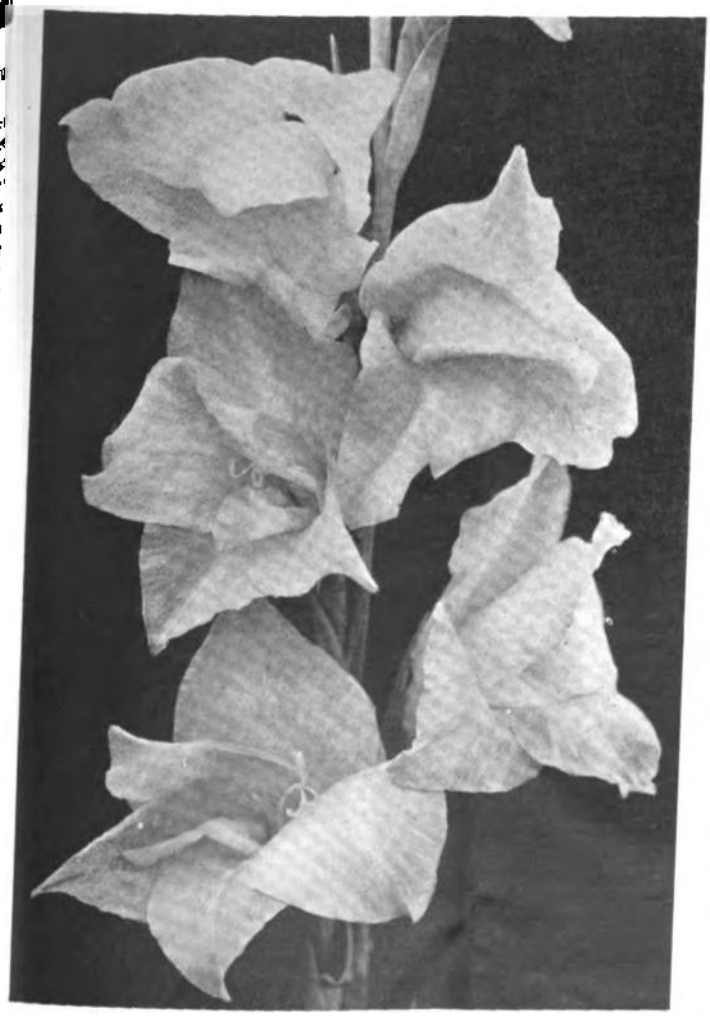
A GREAT PROVINCIAL SHOW

THE Southport Flower Show goes from strength to strength. In 1926, although only in its third year, the area under canvas was considerably larger than that at Chelsea. That the Southport Corporation has been able to accomplish this in this short time is nothing short of miraculous. It speaks volumes for their enterprise and skill of management. It might be imagined that the show might be a success from the number of visitors, owing to Southport's popularity as a summer resort; but it is more than that. It is a success as a business proposition, as is shown by the number of our largest nurserymen and seedsmen who have supported it from the start and are continuing to do so. A large buying public obviously attends, and it is through them that the latest and best of our garden plants are spread far and wide through the north of England.

This year's Show was noteworthy for two things, the magnificent collections of stove and greenhouse plants and the gladioli. Many keen gardeners of an older generation said that such groups of caladiums and other stove and greenhouse ornamental plants had not been seen since the days of the old York galas. If anything should increase their popularity again, it would be a view of the massed exhibits of Messrs. Cypher and Sons, Mr. W. A. Holmes and Sir G. H. Kendrick, among others. Their exhibits were a host in themselves and worthy of the very best that English houses can produce. It is to be hoped that their lead will increase the waning popularity of numbers of incomparable stove and greenhouse plants.

GLADIOLI.

In the opinion of many, there has never been a finer show of gladioli staged at any flower show. Not only was the quality of the individual spikes extraordinarily high, but the numbers of varieties staged only shows to what a point of perfection the modern gladioli has been raised. It must have been a difficult task for the judges to pick and choose among the different groups. Among the non-competitive groups the most striking was that of Messrs. Sutton, who showed



LADY ADA FITZWILLIAM, A FINE LANGPRIM HYBRID.

RED LADDIE, A CARNATION OF GOOD FORM AND COLOUR.

Digitized by Google

massive spikes, mostly of the large-flowered varieties, arranged in large baskets. This style of display suits those of striking colour particularly well. Red Emperor, with its rich clear crimson tone, was magnificent, as was Early Sunrise, a glowing flame colour, and Imperator, a pure white.

Messrs. Kelway also staged a fine exhibit, not only of better known varieties, but also of novelties. Of the latter two were easily singled out, a large-flowered variety, Queen of the Roses, of a very pure tone of rose and a deeper throat. The shape of the flower was excellent and the texture perfect. The second was a Langprim, Lady Ada Fitzwilliam, most distinctly hooded, of a fine flame colour with a deep cream throat. Other non-competitive exhibits of gladioli included Messrs. R. H. Bath, Limited, who, though not real specialists, staged a fine exhibit among which were to be seen the deep crimson, Crimson Glow, with darker markings, and Dawn, a lovely salmon flower of good shape with a darker throat; and Messrs. Unwin, whose large exhibit of primulinus and large-flowered hybrids showed what care is taken in their cultivation at Histon; all the varieties staged were in the best of condition, and the wide colour range made their exhibit most attractive. This exhibit was considered one of the finest ever staged. Messrs. Daniels Brothers, Limited, staged gladioli along with montbretias and asters, among the gladioli being the brilliant crimson, large-flowered Vesuvius, the soft salmon General de Wet, and the canary yellow Souvenir. And lastly, Garden Supplies, Limited, staged gladioli among an attractive exhibit of rock plants, dwarf conifers and montbretias.

Others in competitive classes who had excellent exhibits of gladioli were Messrs. Artindale, with L'Arques, a bright terra cotta, and the magnificent La Lys, a creamy yellow of large size and good texture without being too stiff; and Messrs. Lowe and Gibson, whose collection of primulinus hybrids was worthy of all praise. Many of the newer sorts were to be seen, such as Andromache, the only absolutely pure yellow self; Canopus, the palest of yellows with a lemon throat; Ethlyn, a soft apricot yellow; and Midsummer Dream, a real geranium red, an uncommon colour in gladioli. Messrs. Bees, Limited, also staged gladioli. Most striking were the primulinus arranged in large vases, among them La Reine Victoria, a fiery salmon; and Fire King, a brilliant vermilion with an orange throat. Messrs. Webbs showed gladioli and other border plants, among the former the good salmon Odin was most noticeable. Mr. Alfred Edwards staged a fine collection of primulinus hybrids, among them Seedling A, rose flushed orange; L'Oise, deep cream with rose flush were very good. Mr. P. Gardner and Messrs. W. J. Garner also showed gladioli of good quality.

HERBACEOUS FLOWERS.

Among general herbaceous plants one of the best exhibits was that of Messrs. Isaac House, who staged their fine perennial scabious in various colours, including the fine white Miss Willmott. Then, again, Messrs. Dickson and Robinson showed what they could do with dahlias of every variety and colour, magnificently staged. Other herbaceous plants were staged by the Chalk Hills Nurseries, among them Achillea eupatorium, that should be much more often seen; Messrs. Prichard had Dracocephalum atroroseum, montbretias and the magnificent flame crimson Kniphofia Lord Roberts; and Mr. Jones's phloxes were very fine, among them Europe, blush white with rose ring, Telma, salmon with deep eye, and Exquisite, white with rose centre. Messrs. Carter staged a fine exhibit with a centre of Lilium tigrinum Fortunei giganteum, surrounded by mixed large asters of all colours and with baskets of lilies and gloxinias at the side. Mr. Amos Perry had a most interesting exhibit with a little pool filled with water lilies in the centre, surrounded by some less commonly seen plants such as the rare Montbretia rosea, the excellent perennial Stokesia cyanea cœrulea, that should be far more often grown, and watsonias of various shades. Messrs. Blackmore and Langdon, as well as staging delphiniums of various excellent sorts, had a wonderful exhibit of the begonias for which they are so famous. Among them was a new break called Begonia crispa marginata, a frilled single with orange centre and rose edging, a most striking plant. Two other begonias, Bryon Langdon, an enormous salmon double, and Sydney Robinson, one of the best oranges, were most noticeable. The beauty of Messrs. Wells' exhibit was much enhanced by magnificent spikes of Liatris pycnostachya, the deep mauve-purple spikes of which are the glory of the late summer garden, as also are the orange-crimson spikes of Kniphofia nobilis, one of the best of the red-hot pokers.

Messrs. Reamsbottom showed St. Brigid anemones; Messrs. Forbes of Hawick showed fine collections of phloxes and pentstemons, among the latter one of the best of all, the rose-scarlet George Horne, with large pips; Messrs. John Peed showed crotons, lilies and hydrangeas; Messrs. Hewitts and Messrs. Bees fine collections of delphiniums; Messrs. Russell clematis and tree ferns; Messrs. Waterers a fine collection of herbaceous plants, such as lilies, gladioli and phloxes, as also did Messrs. Harkness, together with a few of the lupins for which they are so famous.

Messrs. E. F. Fairbairn had a fine exhibit of phloxes well arranged in big vases, among them the deep rose Signal and the true rich purple called The King. Messrs. W. H. Simpson had not only fine spikes of gladioli, but excellent antirrhinums, among the latter The King, a really good orange-scarlet of good substance and magnificent tone. Messrs. Clibrans, as well as their fine stand of stove and greenhouse ornamental plants, had a nice table of streptocarpus and gloxinias in good variety; Messrs. Bakers showed a mixed group of herbaceous plants such as kniphofias, delphiniums, phloxes, hollyhocks and gladioli. They all showed signs of the excellent material for which this firm is famous. Messrs. Keith Luxford showed early chrysanthemums in good variety and carnations.

DAHLIAS.

Messrs. Treseder and Sons staged a fine collection of cactus dahlias in great variety and showing excellent cultivation, as did Mr. H. Woolman, whose cactus forms were most noteworthy, among them the fine Ballet Girl, white shaded vermilion, and Canary, a good lemon yellow. In Messrs. Jarman's exhibit of dahlias two deep black-crimsons were striking, Conquest and the large decorative King Harold. Messrs. Dickson and Robinson's stand was noticeable from the fact that the blooms were arranged without wires, and very attractive they were, too. Edgar Jackson, an orange-vermilion, looked particularly well. Messrs. Hewitt also staged an excellent show of dahlias, among which the brilliant scarlet-crimson Martial was most noticeable. Messrs' Dobbie had a fine show of dahlias for which they are so well known, along with potatoes and roses. Among the first was the good crimson Glen Etive and the charming anemone-flowered Seafield.

CARNATIONS.

Mr. Engelmann won the silver challenge cup with a wonderful collection of perpetuals, as usual magnificently shown. Among the varieties were Red Laddie, the deeper form of the ordinary Laddie, the deep lavender Arnos Grove and the scarlet Spectrum. Messrs. Allwood showed perpetuals in good variety, among them the fine yellow Maine Sunshine and the scarlet Edward Allwood.

FRUIT AND VEGETABLES.

Good collections of apples and peaches in pots were shown by the King's Acre Nurseries; and peaches, nectarines and plums by Messrs. Rivers.

The Hon. Vicary Gibbs' exhibit of vegetables has never been better, and Mr. Beckett deserves every credit not only for the magnificent cultivation shown, but also for his staging of vegetables.

ROCK GARDENS.

The rock gardens were limited in size and were much alike in form, with a central stream round which clustered rocks. They were too obviously planted for late summer plants, and so would be almost impossible in practice, although the general display was a most effective one. However, Mr. T. R. Hayes well deserved his success in winning the silver challenge cup, with a subdued design in which the rock was excellently placed. Good use was made of dwarf conifers.

Further details and List of Awards will appear next week.

GLADIOLI AT VINCENT SQUARE

CONSIDERING the number of important provincial shows which have been well patronised by the trade during the last few weeks, it is surprising how the supply and quality of the plants at Vincent Square keep up to the standard. This Show in itself was noteworthy for the excellence of many plants, especially gladioli. Dahlias of every type were well represented, while miscellaneous groups of hardy flowers and fruit occupied a fair space.

A splendid group of gladioli was staged by Messrs. R. H. Bath. Varieties which are particularly suitable for garden decoration were on show. Xanthia, a brilliant orange primulinus hybrid; L'Exuette, a cherry red variety blotched with yellow, belonging to the same class; and the large-flowered varieties, Duchess of York, bluish purple; Principine, carmine red; and Jack London, striped salmon, were a few of the best.

Messrs. Hewitt's gladioli were in excellent condition and of remarkable size. Red Emperor, a glowing scarlet red; Rose Precoce, a beautiful rose-coloured gladiolus; and Love's Fire, a striking scarlet self, were perhaps the most prominent varieties. A large and imposing gladioli group was staged by Messrs. Kelway and Son. Numerous "Langprim" hybrids of recent introduction were on show, as well as such well known varieties as Rev. J. Stubbs and Golden Girl. Langport Scarlet, A. E. R. Gilligan, T. S. Hope Simpson, Kelway's Defiance, T. W. Sanders, Beau Brocade and The King were all noticeable. The Orpington Nurseries staged gladioli of both types. White City and White Giant, two fine large-flowered varieties, and the old favourite, Willie Wiseman, were included. Mr. G. Whitelegg had some fine primulinus hybrids, particularly in shades of orange.

The Foremarke Challenge Cup, which is awarded each year for the best twenty spikes of gladioli in not less than ten varieties, was won again this year by Messrs. G. Maw and Sons. Gertrude and Cally were the best specimens. Messrs. Dobbie showed massive spikes of pedigree seedling gladioli.

A handsome collection of fruit was exhibited by Baron Bruno Schröder. Peaches, nectarines, grapes, apricots, plums, melons and pears, all large, well ripened and in

BURPEE'S NEW SWEET PEAS

3 Striking Novelties

THREE entirely new varieties—each as fascinatingly attractive as it is novel. Two distinctively new colours, and a brilliantly dark blue. Lovers of Sweet Peas will be delighted with these novelties.

DELIGHTFUL

A rich terra cotta cerise suffused orange or scarlet red. A colour never before produced—the most appealing, in its glowing beauty, of all the richer toned varieties; bright and shining even on dull days, intensified in hot sunshine and startlingly brilliant under artificial light.

GLADNESS

A soft coral pink, intensified by a suffusion of a deeper shade toward the base of the standard and wings. A distinct new sweet-pea colour, which might be called a geranium pink—the softest and daintiest of all pinks—with its exquisite delicacy still further enhanced by a lemon keel.

ROYAL BLUE

A true Royal Blue, but full of life and brilliancy instead of dull and uninspiriting, as is the case with existing varieties; undoubtedly the brightest of all sweet pea dark blues. A flower of great substance and enchanting beauty, extremely prolific in fours.

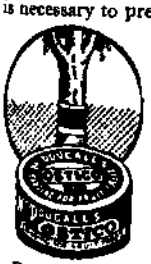
FRUIT-TREE BANDING

is necessary to prevent the wingless females of the winter and other moths from crawling up the trees to deposit their eggs which, in the spring, hatch out into fruit-destroying caterpillars.



Banding with "OSTICO" is the most reliable means of protecting next year's crop. It catches and holds the moths as they ascend the trees.

Only one application is necessary. "OSTICO" is always "sticky" and does not run.

NEW AND RARE NARCISSI

AND A SHORT SELECTION FROM SOME OF THE OLDER VARIETIES.

F.C.C., R.H.S., signifies First-Class Certificate, Royal Horticultural Society. A.M.—Award of Merit. The date after raiser's name indicates the year the Daffodil was put into commerce. The Letters and Figures placed before each variety denote its position according to the Classification of the R.H.S.

1b BEERSHEBA (Engleheart). This is a real advance in white trumpets and is built on somewhat new lines. Trumpet long and slightly funnel-shaped; segments long and slightly pointed. Stalk longer than most of the pure white Daffodils. A very distinct and beautiful show flower; growth vigorous and free. F.C.C. R.H.S., 1926. **£8 per bulb**

2b BERNARDINO (Worsley). A seedling from Lulworth, but much larger and having a taller habit of growth. Perianth creamy white, cup large and prettily crinkled at the edge, deeply tinted orange apricot. Highly recommended. **8/- doz. 9d. each**

3a BRILLIANCY (Engleheart). This may best be described as an enlarged and glorified Barrii Conspicuus. It is a very tall plant, very early flowering, and a great increaser. Delightfully scented. **10/6 doz., 1/- each**

1a CERVANTES. A very early yellow trumpet Daffodil, fine for forcing, extremely florriferous. **16/- per 100, 2/3 doz., 3d. each**

4a EMPIRE (Crosfield, 1911). One of the finest Giant Leedsii yet sent out. A large and perfectly formed flower, with a fine pose. Segments pure white, cup pale lemon passing to white. A quick increaser and good seeder. Early. **27/6 doz., 2/6 each**

3b FIREBRAND (Engleheart). A somewhat starry flower, but well set up and lasting; cup most intense fiery red, segments creamy white. A good grower and rapid increaser. Mid season. A very good pot plant. **18/- per 100, 2/6 doz., 3d. each**

3b FIRETAIL (Crosfield, 1910). A large firm flower 3½ in. in diameter, of best lasting quality. Segments creamy white, broad and overlapping. Disc large, quite flat, of deep red throughout. A.M., Birmingham, 1910, and F.C.C., April 13th, 1921, and F.C.C., R.H.S., May 9th, 1922. Very late. **9/- per bulb**

1c GLORY OF NOORDWIJK (D. Groot and Sons). An enormous bicolor about twice the size of Empress. A.M., Mid. Daff. Soc., 1902. Mid season. **22/- per 100, 3/- doz.**

4a HON. MRS. J. L. FRANCKLIN (Pearson, 1908). A Giant Leedsii of perfect form and extreme lasting quality. Segments pure white, flat and imbricate, slightly pointed at tips. Cup (almost a trumpet) long and regular, slightly reflexed at brim. A large up-standing flower, equal if not superior to any in the market. Plant tall and very vigorous; grand for pots; mid season. **22/- per 100, 3/- doz., 4d. each**

1c LADY MINE (Pearson, 1923). A very bright clear bicolor trumpet Daffodil. The flower is of good form, substance and pose, and is carried on long stalk. Its habit of plant is quite remarkably vigorous and free. **15/- doz., 1/6 each**

1a LEMON GIANT (Pearson, 1921). A remarkably fine trumpet Daffodil of perfect form and a pleasing and novel colouring. The well formed perianth measures 5½ in. in diameter, and is of a clear light lemon tint. The trumpet is golden yellow, 2 in. long by 2 in. across the mouth, which is slightly reflexed and gracefully serrated. The plant is very strong with broad foliage, and the flower is carried on a long stalk. Mid-season. **5/- per bulb**

1c MOIRA O'NEILL (Engleheart). The most refined and beautiful bicolor trumpet yet offered. The large flower is perfect in shape and pose, and the plant is extremely vigorous, having leaves broader than Emperor. **30/- per bulb**

1a POTENTATE (Pearson, 1911). A very large early trumpet Daffodil, of perfect form, bright clear yellow. A most robust grower and wonderfully free; a grand show or garden plant. Early. **2/6 per bulb**

TENEDOS (Engleheart). Without doubt the finest Giant Leedsii yet produced. Flowers of largest size, borne on very long stalks, plant very vigorous and a quick increaser. Segments pure white, of great substance, slightly pointed. The large cup is pale lemon on opening, passing to white when fully developed. A.M. Mid. Daff. Soc., 1923. F.C.C., Mid. Daff. Soc., 1924. **£4 10s. per bulb**

1c VESTAN (Copeland, 1923). A huge bicolor trumpet Daffodil, but not at all coarse. Very vigorous and free. Attracted attention on our stand at Birmingham, April 19th, 1923. **3/6 per bulb**

2b ZILLAH (Mrs. R. O. Backhouse, 1923). A very fine new variety, flower large, segments broad and imbricated, creamy white. Cup large and rather spreading, yellow, deeply edged bright orange-scarlet. A good strong grower. Much admired on our Show Stands at R.H.S. and Birmingham, 1923. **30/- per bulb**

BURTON-ON-TRENT

We won at the above Show, held 11th and 12th August last, TWO GOLD MEDALS for our WONDERFUL COLLECTION OF GLADIOLI. We offer one Bulb of each variety shown in this collection of 50 different varieties at 8/6, two Bulbs of each variety, in 50 varieties, 16/-, six Bulbs of each variety, in 50 varieties, 45/- The new and most attractive Gladiolus at the Show called BURTONIA, raised by us and only stocked by our firm, only 500 to offer, 2/6 each.

OUR GOLD MEDAL CROCUSES.

The earliest flowers of Spring Exhibition Mixtures for Naturalising.

	Doz.	100	1000
Mixed purple and blue	8d.	4/6	40/-
Mixed striped	8d.	4/6	40/-
Mixed white	8d.	4/6	40/-
Mixed all colours	8d.	4/6	40/-

Crocus, special selected for Window Boxes, Pots and Flower Beds.

	Doz.	100	1000
Special blue, named	9d.	5/-	45/-
Special purple, named	9d.	5/-	45/-
Special striped, named	9d.	5/-	45/-
Special white, named	9d.	5/-	45/-
Special yellows, extra	1/-	8/-	75/-

EXHIBITION TULIPS.

THE DARWINS.—The most sturdy-growing, strong, upright stems with massive flowers:

	Doz.	100
Bartigon, bright fiery red	1/6	10/-
Clara Butt, clear pink, flushed salmon rose	1/-	7/-
La Notre, rose pink shading to silvery pink, centre blue and white. Extra forcer	2/-	14/-
Prince of the Netherlands, extra large solid flower of perfect form, rich brilliant cerise red, extra strong stems. First-rate bedder	2/6	15/-

The above 7 varieties, 12 bulbs of each, 10/-.

	Doz.	100
Professor Rauwenhoff, deep cherry rose white base margined blue	2/-	12/-
Princess Elizabeth, extra fine rich soft rose, slight silvery flush at margin, centre clear white	2/-	14/-
Wm. Copeland, violet shading to lilac; when forced the colour is a beautiful soft lavender	1/-	8/-

The above 7 varieties, 100 bulbs of each, £3 10 0

NOVELTY COLLECTION.

THE COTTAGE TULIPS.—The most graceful novelties:

	Doz.	100
Amber, light amber coloured. Award of merit	1/10	13/-
Erasmus, large creamy white, long stem. Award of merit	1/10	13/-
Grand Yellow, very deep yellow, extra fine	2/-	15/-
Mrs. Francis King, very fine satiny rose	1/10	13/-
Nectar, vivid carmine red with clear white base. Award of merit	2/-	15/-
Spinosa, white flower on very tall stem	1/10	13/-

	Doz.	100
Sirene, the wonderful lily-shaped flower, of a very fine glistening satiny rose. First-class certificate, London, Amsterdam	1/10	14/-
Pearl, finest light rose	2/-	15/-
Prof. Westerdyk, wonderful lilac rose, very tall, splendid forcer	2/-	15/-
Triton, glowing carmine rose pure yellow base, the most attractive tulip yet raised, a real beauty	2/-	10/-

Novelty collection ten extra selected bulbs of each of the above 10 varieties, 100 in all, 10/-.
25 Bulbs each of the above 10 varieties, 250 Bulbs in all, 20/-.

Quality.—All bulbs which are not to satisfaction upon receipt may be returned to us and we will gladly refund money and postage. Complete list of other rarer tulips, daffodils, etc., gladly mailed on request.

New Border Carnations.

Our illustrated list for 1926-7 will be published in a few days, and all who wish copies will please apply early. Our own customers will receive copies as soon as published.

Special offers of June-flowering IRISES are made in the same catalogue.

perfect condition, were on show, and bore evidence of great skill in cultivation.

Several firms staged dahlias. Messrs. J. Cheal and Sons concentrated on star and mignon dahlias. Both these types are invaluable for garden decoration and cut flowers. They are graceful in habit, exceedingly free flowering, and carry their blooms well above the foliage on stiff wiry stems. This firm showed some most desirable varieties for bedding purposes, and among them were the mignon dahlias Grace, Meta, Dazzle and Etna; while for the herbaceous border their star dahlias, Horsham Star, Hindhead Star and Salmon Star, would be most attractive. Dahlias of all types and new hybrid sidalceas were shown by Mr. H. Hemsley. Some of his neat button-like pompon dahlias were very effective. Enormous decorative and cactus dahlias, seven of which were recommended for trial at Wisley, were exhibited by Messrs. J. Stredwick and Son.

The new perennial scabious raised by Mr. Isaac House are beautiful as well as being extremely useful border plants. Miss Willmott was a new large-flowered white novelty, Clive Greaves a rich violet mauve, Mrs. J. C. House a rich lavender, and Isaac House one of the darkest of all the scabious. Herbaceous phloxes of brilliant and varying shades were shown by Messrs. J. Cheal and Sons. Some of the finest varieties were Le Mahdi, Elizabeth Campbell, Jules Sandeau, Etna and Evelyn. Mr. F. G. Wood included a number of good late-flowering plants for the rock garden in his collection of hardy plants.

Mr. G. Reuthe staged a general collection of hardy plants, such as Eryngium planum, Echinops bannaticus, Liatris pychnostachya, Anemone japonica Prince Henry and several good shrubs. Roses were exhibited by Messrs. A. J. and C. Allen and Mr. J. Pemberton, and carnations by Mr. C. Engelmann and Messrs. Allwood Brothers.

A most interesting collection of dried specimens of some of the plants collected by Mr. Harold F. Comber during an expedition to the Andes was exhibited. Photographs of a number of the plants in their native habitat were also on show. Some of the plants collected should prove of great value for the garden.

NEW AND RARE PLANTS.

FIRST-CLASS CERTIFICATE.

EUCRYPHIA NYMANSAY.—A robust and free flowering hybrid between E. pinnatifolia and E. cordifolia which received an award of merit in August, 1924. The flowers are large and the foliage a deep glossy green. A very fine shrub. Shown by Lieutenant-Colonel Messel, Handscross.

AWARDS OF MERIT.

ANARRHINUM BELLIDIFOLIUM.—A herb from southern Europe with a feathery spike-like raceme of minute pale mauvish-blue flowers. It grows to a height of about 2ft. Shown by Mr. T. Hay, New Lodge, Hyde Park.

MONTBRETIA LORD LAMBOURNE.—Large blooms of deep bronzy orange shaded at the base with yellow are borne on thick, wiry reddish stems. The petals are slightly reflex and the yellow stamens are shown up well against their glowing colour.

M. E. A. BOWLES.—The flowers of this variety are somewhat smaller, measuring about 2ins. across, and the petals more rounded. The colour is a bright rose-cardinal. Both these montbretias were shown by the Hon. Mrs. Montagu, Attleborough.

PHLOX MAUVE QUEEN.—A clear lavender mauve variety with a conspicuous white centre. The truss is of medium size.

P. LORD LAMBOURNE.—A soft salmon pink phlox with a well shaped truss. A beautiful colour. These two phloxes were raised and shown by the Hon. Vicary Gibbs, Elstree.

ORCHIDS.

PCTINARA LA PAZ.—This interesting hybrid was raised by crossing Sophro-Cattleya Faboris with Brasso-Lælio-Cattleya The Baroness, and thus combines the genera brassavola, cattleya, lælia, and sophronitis. Although the young plant does not appear to possess a robust constitution, the flower is comparatively large, and with all the segments of model formation. The sepals and petals are clear yellow, the labellum orange yellow. Exhibited by Baron Bruno Schröder, (gardener, Mr. J. E. Shill). First-class certificate.

LÆLIO-CATTLEYA × JACQUINETTA (C. Empress Frederick × L.-C. Lustre).—A bold flower of rich purple colour throughout all the segments, with a deeper tint on the labellum and midrib of the petals. Shown by Messrs. Stuart Low and Co. Award of merit.

FLOWER GARDEN

LILIUMS.

How to Pot for Foreing.

A GOOD general compost in which to grow liliums when they are intended for forcing is turfy loam, half-rotted leaf-soil, peat and very coarse sand. Pots 6ins., 7ins. and 8ins. in diameter are the most suitable sizes, as all lilium bulbs are not of similar size even when they belong to the same variety. Probably, for forcing purposes, Lilium longiflorum (also known as L. Harrissii) is the most popular, because the flowers are pure white, large and trumpet-shaped. Few sorts are easier to force, provided the cultivator gives them fair treatment. This includes sound drainage, evenness of moisture while the bulbs are in the frame, and judicious feeding while the plants are growing on towards the flowering stage. Liliums like moisture if it is not stagnant. They also dislike dryness before they are potted, so that it is advisable to have both pots and compost ready for use before the bulbs are unpacked when they are received from the bulb merchant. The pots must be clean and dry when used, especially on the inside. Many crocks are not needed, but the few used should be carefully placed and covered with a thin layer of the fibre from the general compost. Place each bulb on a pinch of sand and charcoal scattered on the soil, then carefully pack more compost round the bulb so that the pot will be three parts filled, with the crown of the bulb just clear above it when the potting in completed. As the stems grow the pots cae be filled with some of the compost in ths usual way. Do not apply too much water. Keep the newly potted bulbs in a darkened frame until growth is free. Other varieties may be potted in the same way.—HANTS.

LATE PRIMULAS AND CINERARIAS.

Final Potting.

THE latest batches of these plants often afford us the best flowers, especially in gardens which are, through their positions, very sunny, because the subjects here dealt with thrive best in cool and intermediate temperatures. From the early part of September to the end of November, approximately three months, the newly potted plants are very active in both root and leaf growth. From December to the end of January very little growth is made except in a few instances. This late and final potting is, therefore, a very important work, which should be carefully carried out. Clean pots, crocks and sound drainage are essential matters. The shift to larger pots should not be a large one, just sufficient to permit of the fingers being inserted between the old ball of soil and the side of the pot. The

Digitized by Google

compost should be carefully mixed and consist of fibrous loam, made fine, but with the fibre retained, two-thirds; sweet leaf-soil, half-rotted, one-third. To each bushel of the combined parts add builders' old mortar rubble, pounded to ensure good mixing, sufficient in quantity to make the whole porous and encourage free root action. Very firm potting is not required, nor is it desirable. Many crocks are not needed; one good-sized hollow potsherd over the drainage hole and three or four neatly placed round it will be sufficient. Do not have the collar below nor above the new compost; water carefully without wetting the leaves, and ventilate judiciously.—CHRISTCHURCH.

ANNUALS FOR THE GREENHOUSE.

HARDY and half-hardy plants in pots are valuable assets to any greenhouse for spring decoration; in fact, were it not for these subjects, many gardeners would have a difficulty of maintaining a continuous supply of bloom throughout the season. Although a book could almost be written on the various plants suitable for spring decoration, perhaps if I confine myself to a few of the most popular of these useful plants it will suffice: Clarkia, mignonette, stocks and wallflowers will provide the greenhouse with a supply of beauty throughout the spring.

Sowing should be started without delay and continued until late autumn in successional batches. Some growers recommend sowing mignonette in seed pans and pricking off into 5in. or 6in. pots, but five plants to a pot; but if five or six seeds are sown in a 3in. pot, and when the plants are ready potted on into the flowering pots, the plants are more likely to make sturdier growth, owing to the roots not being disturbed. The seed should be sown in a compost of 2 parts sweet maiden loam, 1 part leaf-mould and a good sprinkling of sand; and for the final potting 1 part old charred cow-manure and 1 part lime rubble added.

The pots should not at any time be allowed to become dry, as this causes the roots to get bound; an occasional watering with soot water is extremely beneficial.

Clarkia elegans should now be sown in a light compost, and when large enough to handle pricked off into 3in. pots. Place in a cold frame and shade for a few days, afterwards plenty of air should be given. With an abundance of air and sunshine the plants should make good growth. The plants, when ready, should be repotted into 5in. or 6in. pots. For final potting use compost of two parts loam, one part leaf mould, one part sand and half part old decayed manure. Pot moderately firm and remove to the frame again. As soon as the chilly nights arrive the plants should be taken to a heated greenhouse and staged near the glass, admitting air whenever favourable. Where large bushy specimens are required the plants should be stopped once or twice, but if the plants are kept dwarf stopping is not necessary. It will also be necessary to give the plants occasionally a light fumigation with a nicotine compound to keep them clean of aphis.

Double wallflower makes a charming pot plant for spring if sown now in seed-pans or large pots. The young seedlings should be pricked off when large enough to handle and before they are likely to become pot-bound potted firmly into 5in. pots.

The double variety of wallflower is not grown so much now as it was twenty years ago, and yet as a pot plant, when fully grown, will rival either the daffodil or hyacinth both for beauty and perfume when in flower.

Of the stock family the East Lothian is best for spring flowering and should be treated in the same manner as wallflower. As the plants require it, stake and tie them up and, lastly, avoid keeping the plants too damp, for nothing is more detrimental to their growth than a superfluous quantity of water.—G. BARTON.

KITCHEN GARDEN

STORING BEETROOT.

IT is important to lift beetroot in the early autumn to prevent damage by frost. When digging, be very careful not to cut the roots with a fork, or they will "bleed" and be of little use for cooking. Never cut away the foliage from the top of a beet, but twist the stalks off about 2ins. above the root. Place the roots on the ground in little heaps after digging and cover with leaves. After about a week the beets may be taken up and stored. By far the best way of keeping the beets is to place them in sand or some light soil. This should not be absolutely dry, although on no account must it be at all wet. Make a heap of the sand up against a fence or in the corner of a shed. Then push the roots in singly up to their crowns letting the leaf stalks stand clear. Now cover the whole with a layer of fine and somewhat moist soil. This should be deep enough to bury the stalks of the roots completely.—L. B.

MUSTARD AND CRESS.

MUSTARD and cress is such a useful salad that it is a wonder more people do not grow it. Crops of the little seedlings can be raised with the greatest ease throughout the autumn and winter in any frost-free position. By far the best method of culture is on the following lines. Get some shallow wooden boxes and remove the tops and bottoms. Then, over the wooden frameworks thus secured, tack pieces of wire netting. To fit the netting, cut flannel, or any thick material, and, after soaking well with water, place in position. The seed is scattered rather thickly on the material, and this is kept continuously moist. Cress takes longer to germinate than mustard, and should be sown about four days in advance of the latter. The rate of growth depends on the warmth of the situation, but in an ordinary living-room the salad will be ready for cutting in from two to three weeks. By sowing at intervals it is very easy to arrange a succession of crops.—S. LEONARD BASTIN.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE FLOWER GARDEN.

The month of September is a good time to plant many of the irises with bulbous root-stocks, and they include I. Histrio, I. reticulata, with its several varieties, I. alata, and others. Insert the bulbs 2ins. deep, and 4ins. to 6ins. apart. They are ideal for groups on the rock garden, and produce a fine bit of colour in the early spring. The sparaxis, especially pulcherrima, thrives well in this district, the bulbs being left in the ground throughout the year. Bulbs can be planted now, 4ins. deep, and the soil need not be rich for these delightful flowers that appear in July and August. S. pulcherrima may be readily raised from home saved seeds. Another glorious plant for the rock garden, beds or border is Anemone fulgens, which may also be planted this month in fairly rich soil. The flowering season is prolonged by planting again in the early spring. Snowdrops, scillas, winter aconites, bluebells, etc., should be put out during the next few weeks.

Bedding Calceolarias.—Cuttings are now available, and these should be inserted in a cold frame in which has been placed 3ins. of sandy soil on a hard base. In this frame we arrange various marguerites and other subjects that may require a little protection during the winter months.

THE KITCHEN GARDEN.

Spring Cabbage.—Directly the seedlings are large enough, they can be transferred to their final quarters. They often follow the onions, with excellent results, give the plot a liberal sprinkling of old soot and then lightly fork it over. Destroy any leather jacket grubs as the operation proceeds. Hardy coleworts may also be planted.

General Remarks.—Continue to plant out lettuce and make another sowing of hardy varieties. Endive can be placed in a cold frame if one is available, and potatoes must be lifted when the weather is suitable. Most herbs, such as thyme and sage, can be increased by cuttings set out in the open ground, and celery is earthed up during a spell of dry weather. When earthing up celery, remove all weeds, side growths and decayed leaves, tie each plant with raffia, which will keep the soil from the heart of the plants. The soil should be well pulverised and made firm.

At this season the question of storing vegetables for winter use will arise, and there is nothing better than a cool, airy shed from which frosts can be excluded if needed. Onions do not object to a little frost, providing they are dry and such roots as carrots, turnips, beetroot, etc., should be embedded in sand or sifted ashes. Here they will be preserved in good condition. Potatoes are covered with straw to exclude light, and it should be remembered that frosts must be kept out or the tubers will be ruined.

THE FRUIT GARDEN AND ORCHARD.

Now is a suitable time to make plans for the planting season, and making notes of fresh varieties. New plantations may be trenched and in orchards the holes can be prepared as the opportunity occurs. If the soil is poor, collect a quantity of old turf and stack it ready for the planting season. Early planting is advised and it is best carried out as soon after the leaves have fallen as possible.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE KITCHEN GARDEN.

Onions.—The harvesting of this crop is worth a deal of attention, for on the perfect ripening of the bulbs depends their keeping properties in storage. Lift carefully those bulbs which have completed growth naturally and lay them with their roots looking southwards to dry. Large breadths of onions can only be ripened where they grow, but smaller quantities spread out in frames, where they can have protection in wet weather or on the stages in vineries, will ripen more completely than in the open. Odd bulbs among the crop that are dilatory in finishing their growth should have the top gently bent over at the neck to check this and hasten ripening.

GENERAL WORK.

Weeds.—The month of September is always impressive by its prolific production of weeds. Well kept ground may have a crop blown in from badly tended roadside and other places; while the gardener who adopted a "ca-canny" policy in the earlier part of the season will be painfully aware of the source from which they come. At this season they are apt to be overlooked and consequently do great mischief in choking plants on seed beds and others that are ripening their crops. They keep the ground cold and damp, absorbing food that could be better utilised, and generally spoil the look of things, leaving behind a heritage of worries for future years. Also for the above reasons clear the ground of vegetable remains as the crops are gathered. Retain the soft, clean portions for composting or digging in, rejecting the hard stems of brassica, as they decay but slowly in the soil. My own practice is to have the required amount of manure carted on to the brake and get the ground trenched. And if it is found by the various simple methods in practice that the ground is in need of lime, this is applied as the work proceeds.

Shrubs.—For those who have time at their disposal, an interesting and useful side line is the propagation of a few flowering shrubs of such hardy types as philadelphus and deutzias in variety, ceanothus, buddleias, cotoneasters, weigelas, viburnums, etc. Take shoots of the current year's growth, fairly firm and about 1ft. long, formed as cuttings in the usual way. And if with a "heel," it is all to the good. These will root freely in a cold frame inserted about one-third their depth in sandy soil and given the usual treatment prescribed for cuttings.

Doune, Perthshire. W. MCCARRELL.

39th YEAR

Mrs. PYM'S Famous Plants

AT VERY MODERATE PRICES.

Send for Catalogue of Choice Hardy Perennial Plants for Rockeries, Crazy Paving, Borders, Beds, etc. Plant now for success, and get plants established before winter. Prompt despatch. Correctly named. Carefully packed and guaranteed to arrive in excellent condition.

Orders over 3/- post free, under 3/- please add 4d. extra.

All per dozen, quarter dozen same rate.

Strong Transplanted Plants. Glorious Hardy Primulas should be planted now in the open garden or potted for early bloom in cold house when flowers are scarce. Primula japonica, extremely showy, rich colours, will thrive anywhere, 6/-. P. **pulverulenta**, rich crimson, 6/-; **P. sikkimensis**, scented, lemon yellow, 6/-; **P. Bulleyana**, rich orange, 6/-; **P. Cashmeriana**, large heads, purple, 6/-; **P. denticulata**, large heads, lilac, 6/-; **P. Veitchii**, fine rosy purple; **P. Wanda** (gift of the Ideal Homes Exhibition gardens last spring), free flowering, beautiful rich purple, 7/-.

Pot Now for early blooming in cool house. **Cineraria**, prize exhibition and stellata, 3/-; **Cyclamen**, choicest strains, 6/-; **Nicotiana** (tobacco), white or crimson, 3/-; **Schizanthus**, new, compact, very large flowering, splendid colours, 5/-; **Primula malacoides**, semi-double, mauve, soft rose, rose pink and robusta, a very vigorous variety, mauve, 5/-; **P. kewensis**, very early, golden yellow, 4/-. **Many thousands splendid plants, Catalogue free.**

Wallflowers, strong spring sown; **Brilliant**, blood red; **Belvoir Castle**, golden yellow; **Eastern Queen**, salmon red; **Ruby Gem**, rich satiny ruby; **Vulcan**, rich velvety crimson, and new, large-flowering hybrids, 9d.

NOTES FROM MY GARDEN

THIS year, on the whole, has been an excellent one for rhododendrons. The growths are good and firm, although in some cases the leaves are not so large as they were last year, owing to a cold spell in May. Each year shows more clearly that force of circumstances will make certain rhododendrons alter their season of growth. One of Farrer's introductions, a plant close to R. decorum and an early grower, has been cut each spring for the past four years. Apparently, it has learned its lesson, for only now is it making its growth and in most cases this is not second growth. Many of the new shoots are 18ins. in length and are ripening well, so that there will be little danger of their being caught by the first autumn frost in late October. One of the commonest causes of failure in rhododendrons has just come to light and this may be an object lesson to others. Some years ago a bed was made in gravelly soil in full exposure and was planted with hardy hybrids. For a year or two they flourished well, but after that they began to grow thin and straggly, with little bloom. A day or two ago they were dug up and the reason for their failure discovered. Originally they must have been grown in a heavy soil or clay; they must have been planted without loosening and teasing out the roots, with the result that the clay of the original balls had combined with the gravelly soil to make a ball so hard that a pickaxe was necessary to break it. It is obvious that the tiny fibrous roots have been strangled and the plant stifled in consequence. The lesson is clear; not only must the ground be loosened and prepared for rhododendrons, but great care must be taken to loosen and free the roots from caked soil before they are planted. I am quite sure that 50 per cent. of the failure of rhododendrons, hardy or otherwise, is caused either by lack of care in freeing the roots before planting or by too deep planting, another fault that is frequently seen; the latter, indeed, is not confined to rhododendrons, but applies to almost all shrubs. In every case the root system should be examined and the ground prepared according to the nature of the roots. For instance, it is no use making a small hole and bending a tap root in coils in order to find room for it; the hole should be deep. On the other hand, for fibrous root systems width and not depth is essential. This may seem to be elementary, but it is surprising how many people are careless in this respect.

Last spring I mentioned that I had thinned severely such plants as Spiræa sorbifolia and a philadelphus from China, in order to make them flower. This treatment has been eminently successful and has proved to me once and for all that many shrubs which run to growth and not flower are the better for a constant use of the knife. On the whole I think that wholesale thinning is more satisfactory, if it is done early in the spring. On the other hand, if whole plants have to be removed, this is better done in the autumn, so that the frost can get in about those that are left and so ripen the wood.

So much is written about the glory of Chinese shrubs that one is apt to imagine that they are all good and so plant them indiscriminately. For the information of others I can mention one or two that are not worth growing. One is Buddleia Forrestii, a wonderful plant in Upper Burma and Yunnan, but apparantly unsuited here. It grows at an extraordinary rate, but however much it is pruned and cut back it sets few flowers and those that do appear are poor in colour and last only a very short time. I also consider that few of the species of deutzia are worth growing. The hybrids are so infinitely better in quality of flower, that species, where you have them, can be relegated to out-of-the-way corners. Care ought also to be taken over the selection of berberis. They happen to flower, berry and colour well with me, so having ample space at my disposal I can plant indiscriminately, but in neighbourhoods that do not suit them so well, it is better to enquire as to the best varieties suitable for the neighbourhood before planting. There are few new species that can equal old favourites like the forms of B. stenophylla and B. Thunbergii, or such species as B. Wilsonæ and B. pruinosa. E. H. M. C.

THE EDITOR'S TABLE.

WE have received a box of beautiful gladioli from Messrs. Kelway and Son of Langport, Somerset. The flowers arrived in good condition, indicating that the gladiolus carries well and should prove a good market flower, once it increases in popular favour. The spikes of flowers look most effective in a vase, and they last for some considerable time in bloom, the flowers opening gradually up the spike. Under artificial light, too, their shades of colour stand out well, especially those of a pink and scarlet tone. Among the blooms so kindly sent were representative varieties of the famous Langprim strain, of which Red Rover, a rich crimson and a novelty for 1926, is very fine. Others which were included were Golden Girl, Sylph and Rev. J. Stubbs. Among the large-flowered sorts are the very large salmon rose Countess of Leicester, the rosy scarlet Brooklands, the salmon red Empoclus, and Kelway's Painted Lady. There seems little doubt that, with its grace, beauty, long flowering period and wealth of colour tones, the gladiolus is the flower of the future for outdoor as well as indoor decoration.

FRAGRANCE IN THE ROSE GARDEN

TOWARDS the close of one of the most attractive of his stories, our great statesman-novelist outlined his picture of a garden. It was Lady Corisande's garden: "No flowers are admitted," Lord Beaconsfield says, "that have not perfume. It is very old-fashioned." It was formed upon a gentle slope, with turfen terraces, walled in on three sides, the fourth consisting of arches of golden yew, and had been given to Lady Corisande "in order that she might practise her theory that flower gardens should be sweet and luxuriant, and not hard and scentless imitations of works of art. Here in their season flourished abundantly all those productions of nature which are now banished from our once delighted senses: huge bushes of honeysuckle and bowers of sweet pea, and sweet briar, and jasmine, clustering over the walls, and gilly flowers scenting with their sweet breath the ancient bricks from which they seemed to spring."

"It was very old-fashioned." Here we find the theory, apparently ineradicable, which is held to-day as it was then, that the old roses are more fragrant than the new ones. In one sense, indeed, the theory is true. Raisers of new roses to-day raise scented and scentless roses. So did the raisers of yesterday, but it is only the fragrant roses that have survived. The scentless have disappeared, as will soon disappear the scentless roses of to-day. I think, however, that the proportion of fragrant roses produced to-day is probably as high as it ever was. Certainly we have a larger field to select from.

A PLEASANT ARRANGEMENT OF ROSE BEDS.

But I must come to the garden, for the question I wish to consider is, How shall the Lady Corisande of to-day arrange and plant her garden? The "turfen terraces" we may at once admit, for now, as then, nothing so well sets off the beauty of the flowers as smooth, well made and well kept grass walks.

Then we come to the bowers of sweet briar, and sweet briar in some of its forms should never be lacking in the rose garden. A hedge of sweet briar may, where circumstances admit, be planted on the windward side of the garden, and the use of Lord Penzance hybrids, which give a range of colour from nearly crimson to pink and white or terra cotta, will add much to the interest of the hedge; or large bushes of the Penzance briars or common sweet briar may be disposed in convenient places about the garden, or trained in bowers or screens so that we may enjoy the delightful scent of the leaves whatever wind may blow.

The common sweet briar, now obtainable from nurserymen, is a tall-growing plant with arching stems. This tall, arching plant, however, is not the true sweet briar, R. rubiginosa, which is a dwarf plant about 2ft. or 3ft. high with smaller leaves, which, according to Colonel Woolly Dod, have a more pronounced scent. This dwarf, highly scented form is at present difficult to procure, but as it grows wild in many parts of England, particularly in the chalk districts, it should not be long before it is generally obtainable if any demand for it should arise, as I hope may take place. There are, however, few organs of the rose that are so readily affected by changes of climate and cultivation as the foliar glands. This was noted many years ago by Professor Crépin in reference to European roses, and the changes produced in the glandular organs of the moss rose by change of habitat have more recently been the subject of observation in India. It seems probable, therefore, that we have much yet to learn as to the methods of cultivation that may bring us the greatest amount of perfume from the scented leaves of our sweet briars.

AN OLD-WORLD ROSE GARDEN.

Next we may turn to the climbing roses, particularly to the Wichuraiana hybrids, which may be trained to cover arches, pillars or bowers. Here there is one rose, and one only, that is quite indispensable, the Wichuraiana Evangeline. The flower is single, pale pink with whitish centre, and, though pretty if it opens in fine weather, is rather easily spoilt by rain; but the perfume is delightful. I know of no climbing rose that equals it in this respect, and when an arch or pillar of this rose is in full flower, it will, on a summer evening, scent the garden for yards around it with a sweet and rich perfume. I have four or five arches of

Digitized by Google

this rose planted in different parts of the garden that they may afford this delightful odour.

Though no other rose appears to scent the garden as does Evangeline, some of the other Wichuraianas have a pleasant perfume, particularly François Juranville, Purity and Léontine Gervais. The multifloras are usually scentless, but an exception is found in Tea Rambler; and the hybrid Bourbon Zéphirine Drouhin, though only a semi-climber, has a delightful perfume.

Except for these, we have to turn to the hybrid teas and their climbing sports. One of the most fragrant of these is Colcestria, a large but somewhat loose flower of pink colouring. It is fairly free in flowering, but not quite continuous, as there are decided gaps between the flowering periods; but its fragrance is delightful. Another good H.T. that may be used as a climber is Avoca, a crimson rose of fine form and fragrance. It will clothe an 8ft. pillar, or may be grown on a low wall or screen, and when so used it is much more free and continuous than when treated as a dwarf rose and pruned hard back.

summer evening as one entered the garden was very pleasant. The pink rose Ellen Poulsen has some fragrance, though it is not often strong, as also have Léonie Lamesch and Cecile Brunner; while Eugénie Lamesch reminds some people of the violet perfume.

A few big bushes 6ft. or so high and allowed to develop to some thickness should certainly find a place in the scented rose garden, and for these we may look in the first place to some of the hardy rugosa race or Japanese roses.

Some of the best of these are Rose à Parfum de l'Hay, a crimson rose of poor form but delicious fragrance; the pink hybrid rugosa Conrad F. Meyer and its cream-coloured sport Nova Zembla; and the white Blanc Double de Coubert; while, if the list can be extended, the pink Delicata and crimsons Mrs. Anthony Waterer and atropurpurea may be added.

In this form also may be used the hybrid tea Grüss an Teplitz and Zéphirine Drouhin (H.B.), which I have already mentioned.

THE RAREST CHARM OF AN ENGLISH GARDEN, A PERGOLA IN ITS DRAPERY OF WHITE AND GREEN.

Climbing Chatenay and Climbing Ophelia are both good examples of climbing hybrid teas, and sweetly scented.

Climbing Richmond, out of doors, has been disappointing, and, though Climbing Château de Clos Vougeot is better, and I have had it doing well for a time, the plants have never lasted with me for very long. Still, it has such fine crimson colour and excellent fragrance that it is worth trying.

For a fragrant white climber, resort will be made to the hybrid noisette, Mme. Alfred Carrière.

The polyantha pompons have, as a rule, little or no fragrance; but the white Yvonne Rabier is an exception and is sweetly scented. This, according to Mr. Daniels (THE GARDEN May, 1911), is a cross between a Wichuraiana and a dwarf polyantha. In order to get the best effect from its fragrance it should not be pruned closely, but grown into a bush 6ft. or so in height. Mr. C. C. Williamson, the President of the N.R.S., used to grow it in this manner near the wall of his house, at the entrance to his garden, and the perfume on a

Turning then to the hybrid teas, which must, of course, form the mainstay of the rose garden, I shall place at the head of my list Mrs. Bryce Allan, a pink flower of most delightful fragrance. The colour, perhaps, is rather a hard pink, but the plant is a good grower, and carries its well formed flowers on strong stems. Other fragrant pink roses are Columbia, Lady Alice Stanley, Mme. Abel Chatenay, Gustav Grünerwald, and one must not omit Mme. Butterfly and Ophelia; while the fragrance of Mrs. George Norwood is excellent, but it is too poor a grower as a cut-back to recommend for the ordinary garden. The day of the hybrid perpetual has already waned, but those who can still find room for a few of these old roses will find no fault with Mrs. John Laing and Ulrich Brunner on the score of fragrance.

Among the crimsons we may fine plenty of choice, and, though it ranks among the hybrid perpetuals, I must still put at their head Hugh Dickson for its fine perfume, notwithstanding its want of flowers during the summer after its early

Digitized by Google

flowering is over until the autumn flowers arrive. The old bedding roses General McArthur and Richmond will bring us plenty of fragrance, and among the taller growers there are Florence Haswell Veitch, Laurent Carle and Avoca, which I have already referred to. A rose I like for its form and fragrance is Dora van Tets, though I could wish it was a better grower; while William Bowring, though rather weak in the stalk and not too well formed, is one of the most fragrant roses we have.

The very dark crimsons also provide some highly fragrant flowers, and of these Château de Clos Vougeot, Hoosier Beauty and Etoile de Hollande must certainly be included, also, if a place can be found for it, George Dickson, for when we find a flower good enough to bring indoors it is lovely in form and perfume; but I do not know where it is to be placed in the garden, on account of its disabilities—a bad head-hanger, the flower generally quartered, the foliage subject to mildew, and the growth awkward and inconvenient. These defects make a sad list, yet I would not myself discard it, for the few magnificent flowers one can pick in a season make up for many deficiencies.

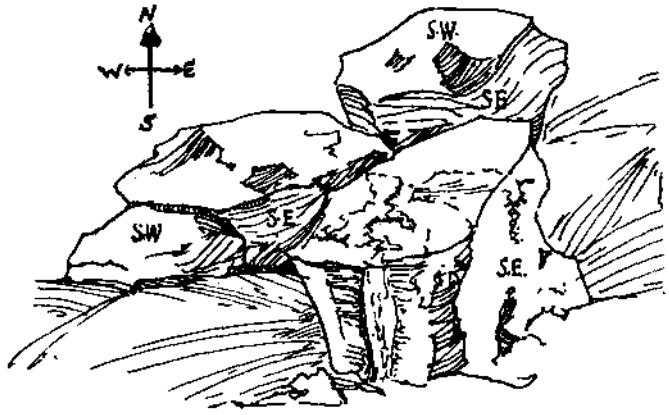
Of cream or white shades there are three outstanding roses—Westfield Star (a sport from Ophelia), Mrs. David McKee and Marcia Stanhope. They are all delightfully fragrant, with slightly differing perfume, and grow well; but Marcia Stanhope must be watched for mildew, and early preventive measures taken. I may also add the tea rose Mrs. Foley Hobbs, a lovely flower but useless in the garden from its head-hanging habit.

It is, perhaps, a question whether any yellow roses can be admitted. There are, however, two which should receive consideration. The first is the Duchess of Wellington, which makes fine growth and in fine weather is a good garden rose with quite a distinct perfume. If, however, it prove wet, Duchess of Wellington becomes one of the most useless of roses, the petals cling together and the flowers rot without opening. The other, Mabel Morse, does not suffer from this defect and my friends generally tell me it is fragrant. I can certainly detect some scent, but it can hardly be called pronounced, and if Mabel Morse finds a place I think it must be because it is in other respects a good garden rose, and there is no other of its colour more highly scented, unless, indeed, we resort to the Dijon teas, a race which is rather going out of favour.

Such being the material, it remains to arrange the roses in the garden. Here individual taste and the conditions of the site must come into play, and I can only lay down a few general rules: (1) Try to arrange for a sweet briar hedge on the windward side of the garden; (2) mass round the entrances highly fragrant climbers and pillars; (3) arrange for some big bushes and pillars of fragrant roses in the midst of the garden; and (4) in arranging the dwarf growers mass the colours into well thought out effects. H. R. DARLINGTON.

DESIGN IN THE ROCK GARDEN

YOU can set no greater pitfall for the jobbing man—or the professional gardener, for that matter—than to ask him to build you a rockery. It is the same problem that Lancelot Brown and his followers tried to master and in the end mastered them—the problem of copying nature in an unnatural setting. These raised beds, to be seen everywhere, stuck all over with spears of rock like blanched almonds, are like the nightmare creations of Brown's brain and I hope will die a decent death before this generation has passed away!



No, a real rockery, however small, is a workmanlike affair, not to be put together in a hurry and sprinkled on top with any rocks left over. The rock garden or rockery may be for a variety of purposes and its treatment will vary accordingly.

There is the case of the gravel or sand pit, which provides the chance of forming a sunk rock garden. The banks of the pit will be built up in a slope, varying from a batter of half-an-inch to a foot to a slope of 45° or less. Here and there a ridge will be run out to drop steeply—sometimes almost vertically—to ground level. In a hard rock the sides of the bank will fall back sharply from such ridges; in a soft sandstone, more gradually. Rock steps should be placed to allow one, to reach the higher level and in so doing to see some of the plants at closer quarters. The bolder convex surfaces and ridges will be enhanced by planting dense shrubs, like Genista hispanica, Cytisus præcox, Escallonia langleyensis, Fuchsia globosa, olearias and some shrubby veronicas. Too many rock cliffs will give a restless and unnatural appearance, but when decided on should be built up with some of the boldest and tallest slabs and planted on top as suggested. Contrasting with such upstanding features, the concave sides of the pit must have the rocks built up in ledges with the flatter slabs and planted with dwarf shrubs (Veronica Autumn Glory, Cotoneasters humifusa and microphylla, Juniperus Sabina procumbens and Iberis corriæfolia, etc.) and creeping plants. Mass the rock roses here with vaccinium—where non-calcareous soil—and the host of alpine pinks, saxifrages, gentians, erinus (which will seed itself happily into the rock crevices), Polygonum vaccinifolium and Veronica rupestris. Let them spread themselves in mats till they have clothed the banks in evergreen and deciduous drifts. When you have the *forms* of your plant groups schemed, then you may begin to plan your colour arrangements. This is true for all rock garden work.

Very often a slope has to be retained with rockwork. According to the situation and the depth to be retained, this may have to be a wall, properly built in cement, or a dry wall with blocks of roughly squared stone, or it may be a soil bank informally built up with slabs of undressed stone. If a rock bank is to be made, the first thing to be decided is the disposition of the main ridges and strata and for this a visit to the quarry gives the best idea of how to plan the slopes and stratifications. An example of the trend of the rock surfaces is shown in the accompanying sketch, where the strata slope downwards to the south-west and the rocks break vertically in this direction and at right-angles to it. Such an arrangement is ideal since it gives sun-baked shelves to the south and south-west, clefts and rock faces to the south-east and south-west

Digitized by Google

as well as, of course, shady clefts at the back of the rocks, where ramondias and other shade lovers may be established. Whatever direction is chosen, the same trend of the strata should be kept throughout the garden. A wonderfully restful and natural appearance is created where this simple guide is followed.

When the ridges and margin of the bank are mapped out, the sections may be designed in detail. The gullies may be made into miniature moraines, where some of the treasures of the garden may be given a home after their own heart—for instance, Dianthus neglectus and D. alpinus, some dwarf campanulas, Gentiana verna, Raoulia, Potentilla nitida and some androsaces. The knolls and summits will be planted with dwarf or larger shrubs, according to the scale of the rock garden, and with aubrietias in all shades, double arabis and alyssum to clothe the bare shoulders quickly. Cistuses and alpine rhododendrons will be at home here, as well as the other shrubs mentioned previously. From high clefts let Saxifraga lingulata hang its silver rosettes, with sempervivums in moderation and dianthi revelling over the sunny rock faces. Spaces will be left on the slope of the bank for massing mossy saxifrages, Primula Juliæ or gentians; or if on a peaty soil—sheets of pinguicula with sundews and Primula farinosa.

Most fairylike will the bank be in spring if miniature daffodils, winter aconites and squills are thickly planted. To guard against dullness in the summer months, these patches may be sown with low annuals, or planted with nemesia, verbenas or Phlox Drummondii. EVELYN N. COWELL.

AUTUMN COLOUR in an AMERICAN SHRUBBERY

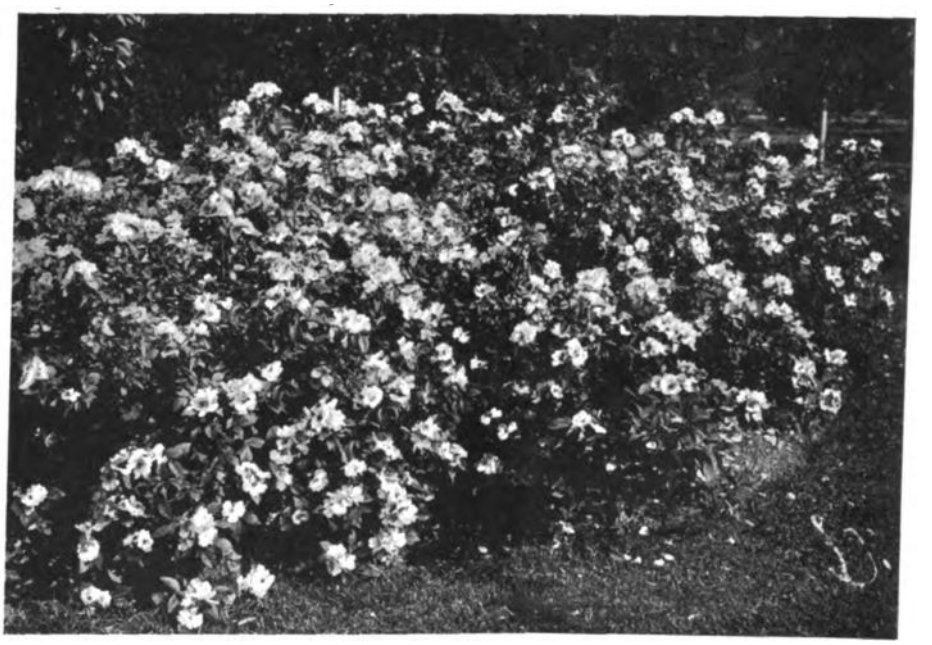
Mr. Marshall is owner of one of the best arboretums in the Middle West, and in this interesting article he describes the use of native shrubs for colouring in the autumn. The information he gives should be of great use to all who love autumn tints—and who does not?—for most of the plants he mentions are well known in this country.

AUTUMN, mellow and lovely, following close on summer's breathless heat, transforms the landscape from uniform green to marvellous banks of colour. The distant forests, half hidden in autumnal haze, blend into the foreground with vivid reds and yellows. For the first time during the year the trees and shrubs assert their true personalities, for at no other season does their individuality so markedly stand forth.

In the eagerness of collectors and nurserymen to acquire the unusual, Japan, Siberia and China have been combed for a host of importations. All of them, perhaps, have some intrinsic mark of merit, but the particular adaptability and beauty of our own native stock should not be overlooked.

No finer background, for instance, can be found than the sassafras. Vacillating between tree and shrub, it is by this very virtue well adapted to plantings where height and denseness are desirable. Its mitten-shaped leaves, soft green during the summer, become saffron as the season wanes, changing again to deeper shades tinged with red before they finally drop off. Grouped near should be the cornels—some in reality small trees, others shrubby in form. Bursting into bloom while the landscape is still bare, with four-petalled white and pink blossoms, they are, with the shad bush (amelanchier), among the first shrubs to bloom. After this splendid show is over, they drop back into the ranks of green until frost is in the air, when again they flash forth in brilliant tones of scarlet, crimson and russet.

After the last leaves have fallen, Cornus stolonifera stands forth against the winter landscape a mass of red branches: this particular variety of dogwood is more commonly known as red osier. The pale whiteness of the under leaf contrasts with the bright upper surface of scarlet. The silky dogwood, C. Amomum, lover of wet ground and stream border, stands out well with its twigs of deep purple amid the falling leaves. The hairy C. asperifolia, brown-branched, looks best when planted with C. Baileyi—the latter usually found around our Great Lake region together with C. alternifolia. This last differs somewhat from the others, in that the leaves are found in little tufted bunches, rather breaking up the regularity of the other cornels when planted together. With its alternate leaves it is a most vigorous shrub, ranging on the Atlantic seaboard from one extreme to the other.



ROSA SETIGERA, ONE OF THE MOST CHARMING OF ROSE SPECIES.
Splashes of purple, green, bronze and red appear on the one bush.

Then, for a change, there might be the Hamamelis virginiana, or witch hazel. When all other shrubs are preparing for the winter, the witch hazels optimistically begin to flower. Even in August, one may see the tiny buds unfolding. September, October pass and it gaily blossoms. Cheerful, delicate things they are.

Using these higher tree-like shrubs as a setting, one may place the somewhat lower Rhus canadensis, the most fragrant member of the group. Nearly all the rhus family have interesting fruits. Dull, rich red berry clusters stand out from the red and yellow of the leaves. Here belong the twins, glabra and typhina, so often found together in their native state. In fact, more than a second look is often necessary to separate the smooth from the staghorn. They are lovely, with huge fruited cones standing out against the scarlet leaves. By all means here should also be the feathery-leaved forms called lacinata. In fact, the family as a whole is a most versatile one, ranging from R. copallina, the mountain sumach, down through the strange R. cotinoides with its smoky pedicels, to the several poisonous members of which the less said the better.

Nor in plantings should one fail to remember the possibilities of the buckeyes, or horse chestnuts. Æsculus arguta, with dark green leaves during the hot summer days, turns to the most brilliant orange in the frosty air. Octandra and parviflora are also typical natives and not to be neglected. Their dull russets lend an interesting though somewhat subdued note to the gayer sumachs.

Conspicuous for their autumn shading are also the viburnums. The hobble-bush, V. alnifolium, takes a particularly brilliant red. V. Opulus, or the high-bush cranberry, found in our extreme north, blossoms generously with clusters of white flowers, soon replaced by green

Digitized by Google

berries turning to yellow splashed with vermilion. The leaves themselves turn a daring red, persisting late into the season. Most interesting of all the viburnums from the standpoint of exotic coloration is V. acerifolium. The purple drupes crown a bush of scarlet. It startles one on finding the very next neighbour has forsaken the conventional hue for one of pinky white or a delicate shade of old rose. Imagine, therefore, what a range of shades one may find where a whole cluster is planted.

By all means the downy viburnum, V. pubescens, should be placed near for the sake of contrast. This is somewhat smaller in stature, and turns the deepest purple. Many of the leaves are downy, others quite smooth, affording most unusual shading to the shrub. Viburnums dentatum and cassinoides, and Symphoricarpus racemosus as well, can be placed near by way of variety and for their lovely berries.

Another crimson beauty of very early autumn is Itea virginica. Though it colours in late August, the vivid scarlet stays well into the autumn, holding its own with the other, perhaps better known, species not indigenous to our country. Rosa setigera, or the Michigan rose, is another good plant. Of the innumerable roses here, it is one of the quaintest and most charming, not so much for bloom alone as for dignity. Splashes of purple, green, bronze, red and yellow appear on the same bush—at times a veritable riot of colour.

Brief mention should be made of the "burning bushes," Euonymus americanus and E. atropurpureus, distinguished for their fruit rather than for their hue. The latter is usually classed as a tree, but is more properly a shrub. Its purple capsule splits open to disclose seeds of the brightest scarlet, a unique colour combination.

The spice benzoin, Lindera benzoin, and the alders, Alnus rugosa and A. incana, are excellent examples of late yellows, more or less brilliant in shading, which can well be placed near by way of contrast. And for a patch of deeper tone one might group the dangleberry, Gaylussacia frondosa, and a plant of elder, though here the shade is a rather tawny one and somewhat subdued. Blending in nicely, a bush or two of Pyrus coronaria ties in with the host of lusty thorns.

These are truly a native family. Rough and hardy, somehow reflecting the rigour of our land, with all the characteristic tenacity necessary for the carrying on of a vigorous existence, they spring up in every fence-row.

Crataegus tomentosa, C. punctata and C. mollis, though similar in late colour, have their separate individualities. C. mollis is the most desirable of them all. Close growing and compact in a fine pyramidal form, it is a joy to use for close planting or even specimen work. Loaded with scarlet apples, it stands out with brilliant orange and red leaves through sheer personality. Therefore, this shrub-like tree is by far the most popular where selection is limited.

G. G. MARSHALL.

NOTES OF THE WEEK

THE MARSH GENTIAN.

GENTIANA PNEUMONANTHE, to give it the name bestowed upon it by Linnæus over two hundred years ago, and by which it has been known ever since, is one of the most beautiful and interesting of our native plants.

The marsh gentian is found in various parts of England, but it is strictly local. As a rule it delights to grow in spongy, peaty turf, pushing its slender, erect stems through the dwarf furze and heathers. In August these stems, with their narrow, dull green leaves, break into blossom, holding upright at their tips the elegant, narrow bell-shaped flower which is streaked with beetle-green on the outside and burnished with sapphire and emerald within. But if the marsh gentian does not vary very much in the colour of its flowers (there is a white form, and a pink has been reported), it shows considerable diversity in size and habit. Generally speaking, the stems are unbranched and bear two to four flowers in a head, but I know of one "station" where very few of the plants (scattered over about an acre) have more than a solitary bloom. Then, as regards stature, one may get a range of sizes from a dwarf form of 2ins. to others of 9ins.; and then there are those splendid stalwarts of Continental sources which stand at 2ft., with blossoms some 2ins. long all along the upper half of the stem. The average height of our natives is probably about 8ins.

Given a cool or moist soil and full sun, the marsh gentian is very easily grown, proving reliably perennial and an unfailing bloomer. I like to see it coming up through other plants of a suitable kind, and among these the Grass of Parnassus, the bog pimpernel, the ivy-leaved campanula, butterworts and sundews can be recommended—and all of them are "British goods."

Though one must refrain from diving into the interesting history, botanical and legendary, of this very unique gentian, I may remind readers that it was known as the Calathian Violet to the botanists of three or four centuries ago. The word "Calathian" apparently implies a likeness of the flower to a wine-cup, while "Violet" or "Viola" was a name loosely applied to many very different plants. Old Gerard's descripton of the plant is so delightful that I must quote a line or two: "The Calathian Violet is the gift of Autumne: the other violets are of the spring: it hath a little leafe, not unlike to that of the small stock gilliflower. The flower is like a little bell cuppe, of so beautiful a colour, that it passeth the very blewe itselfe."—A. J.

AN OUT OF THE WAY PRIMULA.

AMONG the many species of primula which have of late reached our gardens from the East, there are a few which apparently do not take at all kindly to ordinary conditions in this country. One of these is P. Forrestii, a find and an introduction of Geo. Forrest. One hears many reports of the behaviour of this plant in various districts. In some it does well, in others it misbehaves, pines and ultimately dies for no apparent reason. It is a species, however, which, given a position it likes, will thrive and flower well. In the first place it is a sun lover and should be given a place on a sunny limestone wall. The more vertical the position in the wall the better it seems to do, as it must have perfect drainage, especially in the winter. A cranny or crevice in the wall is its ideal situation. Its rather stout, crinkly leaves fit snugly into the rock and in April it pushes forth a sturdy stem with a fuzzy head of glowing orange coloured flowers. Something akin to P. rufa, a species of easier culture and more hardy, when given a good position it is a free flowerer and spreads rapidly, running along the rock crevices. In spring the plants should be gone over and pressed back tightly into their "holes," because it is almost certain that the frost will have lifted them. This is a point which applies equally well to all primulas and is one which is often overlooked. It is a representative of this handsome genus which is well worth growing in every garden where the suitable position and conditions can be furnished.—T.

PRIMULA FORRESTII IN POSITION.

NATIVE MEADOWSWEETS.

WE have only two really indigenous meadowsweets (spiræa) and both of them are herbaceous perennials of no small garden value. The best known in the wild state, S. Ulmaria, is not an altogether desirable plant to introduce, save in the wild garden; but its double-flowered form is a very handsome subject for any moist soil or waterside, and it does not appear to seed as the typical one does all too freely. This variety makes an imposing, upright plant of some 3ft. to 4ft., with an elegant foliage and many branching stems, which terminate in dense heads of blossom. These flowers, moreover, are much whiter than those of the common single meadowsweet and, of course, they last very much longer. This is always one of the earliest of its race to bloom with me, coming into flower about mid-June and often continuing until well into August.

The other species is the dropwort, S. Filipendula, and this stands almost alone among the spiræas in preferring rather drier quarters, it being common to many limestone uplands, where the vegetation is often sparse. In good, moist garden soil S. Filipendula is liable to become gross, yielding much foliage and few flowers, but in any light, well drained stony soil, with full exposure, in the rock garden or at the front of the mixed border, it will always give a good account of itself.

THE FEATHERY SPRAYS OF THE NEW AND IMPROVED GYPSOPHILA, G. BRISTOL FAIRY.

But in this, as in the preceding species, the double form is by a long way the more attractive as a garden plant, the inflorescences being a cleaner white and more lasting. A very striking, yet refined, effect may be realised by planting the gentian blue Cynoglossum amabile, or C. Wallichii among a scattered grouping of the double dropwort.—A. T. JOHNSON.

GYPSOPHILA BRISTOL FAIRY.

OF the many new, hardy plants which have gained the A.M.R.H.S. during the last few years, there is one which deserves more than ordinary attention on the part of the amateur gardener, and that is Gypsophila Bristol Fairy.

This plant is the result of long and careful selection of seedlings of G. paniculata fl. pl., carried out by one of the leading horticulturists of America, who saw great possibilities for an improved form of the old double gypsophila. G. Bristol Fairy has a much stronger constitution and is more robust and larger in every way that the parent plant, bearing as it does much larger panicles of pure white, double flowers of exquisite beauty, the individual pips are fully three times the size of G. p. fl. pl. As a border plant it is difficult to imagine anything more effective than G. Bristol Fairy, to see the foamy mounds fully 4ft. in height is a sight not easily forgotten; it flowers at least a fortnight earlier than G. p. fl. pl. and continues to bloom until cut down by frost. Although I find it will grow in almost any soil, or position, the best results are obtained if it is grown in good rich loam well prepared and manured.

The reputation of G. p. fl. pl. as a cut flower needs no comment, but I predict that Bristol Fairy will supersede that variety in the near future. Apart from the fact that it is much earlier it also has the great advantage of throwing another crop of bloom after the main sprays are cut.

As an everlasting flower it is ideal and is almost as effective in the dried state, owing to its drying much whiter and larger than G. p. fl. pl. when at its best. I still have the original sprays which were exhibited at the R.H.S. when it received the A.M. and they are in perfect condition.

There are doubtless further possibilities with this plant, as at the moment I am making a series of experiments with the object of finding out what it will do for winter work under glass.—W. WELLS.

NIGHT-SCENTED FLOWERS.

MRS. EARLE in her "More Pot-Pourri from a Surrey Garden," quotes a letter from a Manchester business man who points out how certain night-scented flowers "throw out their precious odours and make the garden all the pleasanter and more refreshing for the night stroll after supper." There are really quite a number of these night-scented flowers. They are for the most part white so that the night-flying insects on which they depend for the fertilisation of their flowers may see them gleaming in the darkness. Many of these are not true night-scented flowers, but give out a greater perfume after nightfall. The wild white campion has quite a sweet scent at night, though this does not appear to be a matter of common knowledge. It may well be that the essential oils are distilled during the day by the heat of the sun's rays and condense at night when the source of heat is withdrawn. The true night-scented flowers are, however, those that open their flowers at night and are gone by the morning.

Sweet Rocket (Hesperis matronalis), derives its name from Hesperos, the evening star, because it becomes more fragrant as evening draws in. This old-fashioned plant was a great favourite of Marie Antoinette and it is known in France by the rather charming name of Julienne des Jardins. There is another hesperis (H. tristis), a half hardy biennial which Robinson calls the night-scented stock, but to most of us this wonderful little plant is known as Mattiola bicornis. It is best to sow this annual in little patches here and there, so that when one is strolling round the garden at night one gets little puffs of its almond perfume. The tobacco (Nicotiana affinis) is too well known to need description. It was named after Nicot, who was a French Ambassador to Portugal, for it was he who first obtained seeds from a Dutch merchant. The name tobacco as is well known comes either from Tobago in the West Indies or from Tabasco in Mexico.

The evening primrose must find a place among the night-scented flowers, though the plant has not a very pronounced perfume There is one, however, Œnothera cæspitosa which is said to give out a scent resembling Magnolia grandiflora. The roots of the œnotheras were supposed to be an incentive to the drinking of wine, and it is from this that they get their Greek name. Then there are the half hardy annual daturas which open their great cups as evening draws in and by the morning they fade away. They possess a very sweet smell and require plenty of room for development. In English they are known by the name of thorn-apples, from their great prickly pods.

By far the most interesting of all the night-scented flowers is a little inconspicuous plant, which, during the day, remains with its petals tight closed like so many little brown buttons on the stem. As night comes on, however, these open and disclose the most beautiful regular elongated heart-shaped petals of the purest white. They then give out a most delicious perfume, reminiscent of jasmine and vanilla. This plant rejoices in the name of Nicterinia selaginoides or if you do not like this, you may prefer to call it Zaluzianskya, after a seventeenth century botanist of that name.

Schizopetalon Walkeri is another imposingly named plant which comes to us from Chile. It has pure ivory white flowers which have a delicate almond scent after dark. Lastly, I may mention the yuccas, as they are particularly beautiful and odorous at night.—EDWARD CAHEN.

THE EVENING PRIMROSE SHOULD FIND A PLACE AMONG NIGHT-SCENTED FLOWERS.

NURSERIES OF THE BRITISH ISLES.—III

THE TWERTON HILL NURSERIES, BATH.

JUST as it takes all sorts to make a world, so has it taken all kinds of nurserymen to build up the horticultural world and its products as we know them to-day. Each fits into the general scheme in his own particular way. Some are specialists, others, again, are general, and all are necessary. Each, in his sphere, has contributed something towards the present high standard of excellence of British horticulture, and in that respect is entitled to praise on the part of every gardener, amateur or professional.

In the realm of specialist nurserymen, there are few firms that have done more to add beauty to our gardens in recent years than Messrs. Blackmore and Langdon of Bath. It is something of an achievement to be ranked as one of the horticultural "immortelles," with only some twenty-five years standing, yet that is what this firm has gained for themselves among horticulturists and gardeners the world over. In this country and abroad their name has become almost synonymous with their productions in the sphere of begonias, cyclamens and delphiniums, and their reputation is of the highest order as general growers and raisers of these wonderful blooms, which never fail to attract the attention of every visitor to Chelsea Show. In 1901, when the firm was founded, the main object of both partners in the firm was the growth and ultimate improvement of the tuberous begonia. This has been the main plank of the firm all these years and that they have succeeded in their aim is well known. Blackmore and Langdon's begonias are now recognised as the finest in the world and are grown all over the globe where the climatic conditions make growth possible.

Beautiful as their exhibits are at the various flower shows throughout the country, these are nothing compared to the display in their nurseries during the month of June and on until October. Here the visitor can see the growing plants, and appreciate with his own eyes the merits of the individual varieties. He can sort out and classify his ideas regarding various sorts while walking round, momentarily registering the characteristics of each kind. In that way the amateur or even the professional can reach definite conclusions as to what plants are likely to suit his particular requirements. There is no risk of deception, for the plants are selected on their face value, which is a most important point from the amateur's standpoint. Moreover, many useful hints as to cultivation are gleaned on a walk round and these will greatly assist one towards success with the plants in one's own garden.

BEGONIA LADY ANN, A MODERN VARIETY OF MESSRS. BLACKMORE AND LANGDON'S RAISING.

The Twerton Hill Nurseries have much to offer in that way. The display of begonias in the greenhouses—a magnificent sight—stands as an object lesson to all gardeners as to what can be obtained in the way of bloom from these plants. There are no half measures here, the very best is got from the plant. Naturally, this is the outcome of many patient years of selection and hybridisation, a point which the amateur is apt to overlook when purchasing plants. The stages of the greenhouse with the full complement of double-flowered begonias, presented a really wonderful colour display on our visit in June last. It is no exaggeration to say that it was one of the most pleasant and alluring assortments of brilliant shades that we have seen. From the roofs of the houses were suspended many of the leading basket varieties, which enhanced still further the general decorative effect.

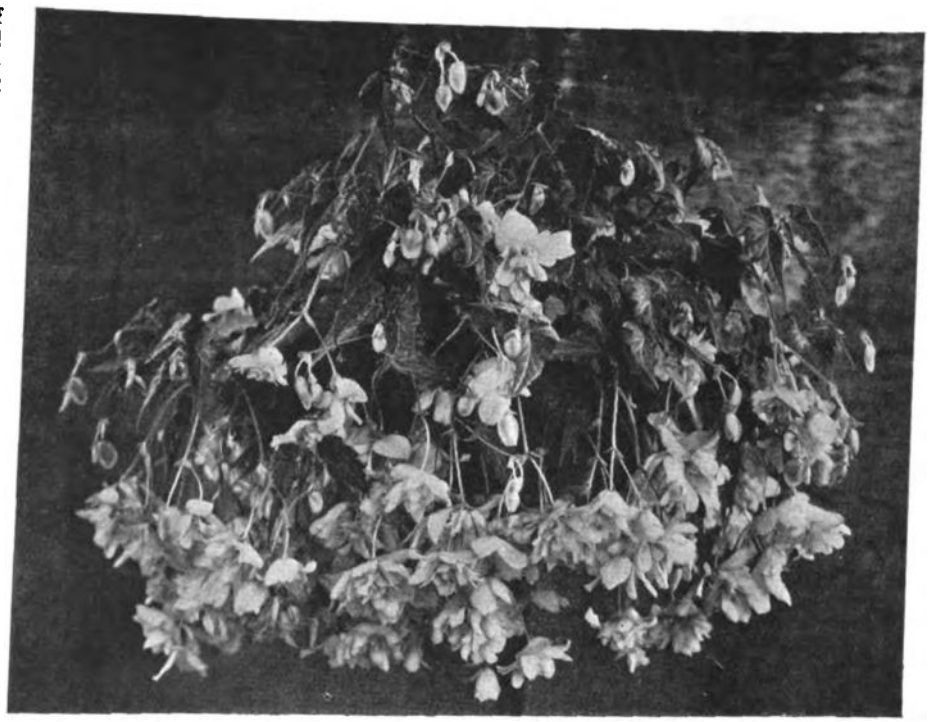
Among the basket varieties, which, by the way, are all tuberous sorts, we noted the old-fashioned Fleur de Chrysantheme, a plant of elegant habit and a profuse flowerer. It is one of the original plants which Mr. Langdon has used in the production of many of his finer varieties, in which the influence of its salmon pink colour is to be seen. All their later varieties, such as Golden Shower, a beautiful golden yellow; Eunice, a light shade of rose pink; Rose Cactus, also rose pink, with pointed petals; and Venus, pure white when fully open, represent the latest evolution in basket plants for the greenhouse or conservatory. From the display which the visitor will see at Twerton in June he will realise that they are unsurpassed for this kind of treatment. Mr. Langdon advocates growing them in flat-bottomed pans rather than in actual baskets, and the results certainly bear out his advice. Three tubers can be planted in pans of 10in. diameter and the result is a well furnished and evenly balanced hanging basket by the summer. One or two of these varieties should be included in this year's order for the sake of conservatory and house decoration next summer.

It is impossible in the short space at our disposal to give an adequate description of the many fine sorts of double begonias which we saw on our visit. The novelties, among which Mrs. E. Ramsden is outstanding, represent real advances in habit, colour and size on previous introductions, although

DELPHINIUM MILLICENT BLACKMORE, STILL ONE OF THE BEST GARDEN VARIETIES.

Digitized by Google

these are already of a high quality. All their named varieties are true to type, being raised from cuttings, and the buyer can be certain that the plants are true. On the stagings of the greenhouses is to be seen a perfect host of varieties, each seeming to outdo its neighbour in size, colour and vigour. It would seem invidious to select any for special mention, but as a guide to those who know little of the begonia, we would suggest the following as representing a few of the best sorts. Hilda Langdon, of large size and of a perfect rose colour, almost a small tree in stature when well grown; Albatross, a pure white; Lord Lambourne, deep salmon orange; Lady Ann, a delicate shell pink; Mrs. W. L. Anslie, still one of the best deep yellows; and Mrs. W. Cuthbertson, lilac rose; Sidney Robinson, a rich orange; and Peace, of a delicate creamy white. These include the pick of the begonia display, although the numerous others are not by any means far behind.



EUNICE, ONE OF THE CHOICE VARIETIES OF BASKET BEGONIAS.

About twenty years ago the delphinium was taken up as a speciality and at the present time it has almost become as great a feature of the business as the begonia. Numerous new varieties have been raised by the firm in the course of time and their success in this sphere is only too well evident by the long list of awards of merit which they have gained from the R.H.S. for their new productions and additions to the delphinium world. A walk round the seedling beds of delphiniums in the nursery is most interesting. One sees all shades of blue, mostly new blends, representing breaks from existing varieties. Combined with the new shades, however, is a great increase in the size of the individual flowers and also in the size of the "pips." In many of these new sorts the "pip" is fully 2½ins. to 3ins. across, giving the flower considerable character and boldness, being either white, brownish and sometimes almost black in colour. Almost every opalescent gradation of blue is to be seen in the modern delphinium, while the latest productions show a decided trace of pink, which although perhaps not attractive to all eyes, is nevertheless pleasant as a new break. Not only does the visitor gain considerable knowledge about the individual varieties, but what is more important from the gardening point of view, he gains some insight into what varieties can be conveniently grouped to form good colour associations. We will mention two which we saw and which in our opinion were most effective. These were three colour groupings in each case—the first of that fine variety Millicent Blackmore, Lord Derby and Blue Boy; the second of George Cochrane, Lord Derby and Blue Boy. One novelty which was brought to our notice at these nurseries was a new variety named Blue Bedder, which is most attractive and flowers at a height of some 18ins., and rarely attains more than 2ft. For those who like novelty in their bedding arrangements, this is a plant for trial.

Among the many other florists' flowers of which the firm hold noted stocks are cyclamen, polyanthus, blue primroses, schizanthus (including a fine dark coloured Wisetonensis strain) and carnations, both border and perpetual varieties.

It is a nursery of which the owners may well be proud and is one which all horticulturists and gardeners should visit if they chance to be in the West Country. They will certainly learn much of what is being done in modern horticulture and appreciate to some extent the efforts of the energetic band of specialist nurserymen, of which Messrs. Blackmore and Langdon are one of the foremost.

CORRESPONDENCE

LILIES FOR THE GARDEN.

SIR,—The article by Mr. R. G. Walter on lilies is encouraging to those who, like myself, long, but fear, to grow them; but further information would be welcome. A classification of lilies into three catagories: those which want, those which endure, and those which hate lime is of prime importance to prevent disappointment.

Next are wanted the proper dates for planting bulbs and necessary warnings as to the behaviour of various species, *e.g.*, L. candidum starts to form new roots soon after the flowers have faded, if, indeed, it is ever at rest, and for success should be as short a time as possible out of the ground and not dried.

Next, notes on propagation are desirable. Why lily bulbs should be so dear is a mystery; but dear they are, and too dear for many. Therefore the keen, but poor, gardener, who wants good clumps, must buy few and propagate for himself. Which species set seed well in our climate. Which require hand pollination. Which must be pollinated from another plant. How long the seeds of each species take to germinate and to grow to flowering bulbs. When seeds should be sown, *e.g.*, as soon as ripe or next spring.

Also notes on other methods of increase and time required to obtain flowers, *e.g.*, which species behave like L. candidum, every scale of which broken from the bulb and planted, will form a bulb and flower in about three years. What other methods are there of inducing rapid formation of bulblets?

Knowledge on these points may be readily obtainable by those who have the necessary books of reference, but a summary and a classification of the species according to cultural requirements would be helpful to many.—IGNORAMUS.

THE PROTECTION OF WILD FLOWERS.

SIR,—Although you published a letter from me on this subject on September 5th, 1925, now that another scheme has been suggested and by an M.P., may I briefly say that the formation of yet another society for the protection of our wild flowers is probably doomed to failure. There are already enough societies more or less interested in these matters, and there is a danger of too much advertisement of increasingly rare plants. We do not want to talk in public about great rarities. That is often how they get known.

Though not a few "grown-ups" need educating in this matter, a greater reverence for all beautiful things, if encouraged at our schools and in our homes, will do more good than the founding of further societies. Incidentally, the *bona fide* naturalist has become a rarity, whereas the number of scientifically trained men and especially women has increased greatly. If some of these teach botany they do not choose rare plants for demonstration or for examination purposes.

A propos the proposed legislation, it was pointed out by "P. R." in the *Westminster Gazette* of August 16th that a principal feature of the Bill is that flower hawkers are to be penalised, but that the right way to deal with them is to educate the public so that it will not buy wild flowers. "What is wanted is not fines and imprisonment," but that the hawker of wild flowers "should be found another job." It is mostly the general public, including well dressed women, who pull up bluebells by the hundred. The same writer thought fit to remark that "many nurserymen sell tame wild flowers . . . and do not hesitate to replenish them from native haunts."

There is an admirable suggestion, on page 474, by Mr. W. Howell, that in schools the boys and girls should be discouraged from collecting plants (may I add because rare), and encouraged to take notes on rambles, and that afterwards they should

Digitized by Google

write an essay on the plant associations noted on the excursions. This is not only in keeping with the modern trend of botanical teaching in Universities and secondary schools, but it should help in the composition of good English, which, like the naturalist of old, is less in evidence to-day.

But the same correspondent, who considers the "over-enthusiastic amateur collectors" the worst offenders, may be reminded that there are in Britain to-day very few collectors for the herbarium who could be accused of doing any serious damage, though, alas! I understand several Cornish rarities have suffered sadly of recent years.—H. STUART THOMPSON.

THE STAGING OF FLOWERS AND VEGETABLES.

SIR,—In the plea for more flower shows made by "R. D.," in your issue of July 31st, I notice the suggestion that vegetables be shown on black velvet. Why? Is not this material quite unsuitable for staging such things? And if one were to suggest the exhibiting of flowers against it, would not the occupation of Mr. Mould and his gloomy assistants at once come to mind? How are poor people to get black velvet? I think a dark leaf-green sateen or muslin of sufficiently heavy texture, excellent background for fine vegetables, and far more in place than a material which properly belongs to a jeweller's window.

As we are to have on this small place of two acres a town flower show within the next week, I am especially interested now in this subject. Our classes for this show number only eleven. For each class there are a prize and two ribbons, and among the prizes are such things as kneeling mats all of rubber, and jars and vases of beautiful form and colour. The flower show is becoming very general throughout America, and it is interesting to see how many banks in smaller cities open their foyers for such shows, often of special flowers, such as the peony or the gladiolus.—(Mrs.) FRANCIS KING, *Alma, Michigan.*

NATURAL REGENERATION AMONG GARDEN PLANTS.

SIR,—Last year Viburnum rhytidophyllum fruited here for the first time, and to-day I was amazed to see the ground beneath it crowded with seedlings. It seems very strange to me that most shrubs and plants reproduce themselves in these gardens so easily without any trouble.

Gunnera manicata and G. scabra, elæagnus, cotoneasters, pentstemons, ericas, cistus, bays, Abutilon vitifolium, berberis, Eucalyptus globulus, Lonicera nitida and even daffodils are a few, taken at random, which come up where one least expects to see them. Doronicum austriacum has proved itself a weed in the woodland, together with the foxgloves.

I think such must be exceptional, and wonder why these plants are so prolific here. I should feel glad if any reader could suggest a reason.—R. MOORE, *Thorpe Hall, Essex.*

"GARDENING WITHOUT A GARDEN."

SIR,—The following have done well with me:

Gentiana verna.—I find this the most accommodating alpine imaginable. Possibly I have got a good strain as I find it flowers freely in all aspects and in any soil (stiff clay, gravel, pure peat, ordinary stones and nothing else, and bulb fibre). During absence, in the winter, it can be left bone dry, and in the summer the pot can stand in a pan of water till return.

Androsace sarmentosa.—Also very good, though its habit is rather too spreading for a pot, as it prefers ramping through aubrietias and dwarf phloxes. It also can be allowed to dry off in the winter and in the summer a good soaking will last for a month.

Soldanella alpina.—Pot culture seems to be the only thing it likes here, though S. montana flowers well outdoors.

Ramondia pyrenaica.

Rock primulas.—Auricula, hirsuta, hybrids of course all do well.

Dianthus.—Ditto, but almost too well to be interesting.

Campanula pusilla.

I think you will find that alpines do not object to soot. It can always be washed off. The exception, perhaps, is Gentiana acaulis. Here it makes great mats, but only produces about two flowers per square foot. Why? When verna covers itself with flowers! And yet the latter is always spoken of as if it was difficult, and sheets of glass and other abominations are recommended. Incidentally they are also recommended for Androsaces sarmentosa and lanuginosa, but are totally unnecessary.—H. SWANN, *Wimbledon.*

PICKING AND STORING APPLES

ALTHOUGH the apple crop this year will not be a heavy one, most people who are fortunate enough to possess a few trees of such varieties as Worcester Pearmain, Charles Ross and King of Tompkins County will be picking quite a good sample of fruit if attention has been paid to proper cultural details, such as feeding, spraying, thinning and summer pruning.

There are several points regarding picking which I should like to mention, for I have found that many amateurs have little idea of when to pick fruit. In the majority of cases the best test as to whether an apple is fit for picking is to lift the fruit upwards so as to bend the stalk. If then the apple parts readily, the fruit is fit for gathering. With most of the mid-season varieties the whole of the crop can be gathered at once, but with early varieties more care is necessary, as these do not ripen so regularly, and most of them are far better if eaten as soon as picked.

Lady Sudeley is quite a good dessert apple for its season if eaten as picked, and the fruit ripens over a period of ten to fourteen days. Beauty of Bath is very prone to dropping before quite ripe, and I always advise a bed of litter under these trees to prevent any apples which fall from bruising. From August until mid-September apples will be picked as they ripen, but on the approach of frost more care must be taken. I have seen some of the very latest apples, notably Sturmer Pippin, hanging on the trees in December without apparently suffering any harm from frosts, but Lane's Prince Albert will drop most of its fruit after one sharp frost, so that when a frost is expected this variety should be picked at once. One peculiarity of this latter variety is that even when carefully picked many of the fruits appear to be bruised slightly when being graded. I have carefully watched these apples and have found that these slight bruises recover, there being no discoloured flesh or rotting in store. Of course, I should never think of storing badly bruised fruits.

That brings me to another detail—care in picking. Last year one of the daily papers published a photograph of a scene in a commercial orchard showing apples being picked into sieves and then thrown into barrels for marketing. Well, that method may do for poor quality fruit which is to be sold quickly, but I would be sorry to see any apples of mine treated in such a way.

After all the care and trouble which has been bestowed on the trees, it always seems a great pity to me to be careless in handling the fruit. Surely it does not take much longer to pick carefully and place in a basket and then grade them in the fruit-room before placing in the trays in which they are to be stored. Of course, in the grading, all misshapen, diseased and under-sized fruits should be placed on one side for immediate use.

As to storing the fruit, those who possess a properly constructed fruit-room will have no difficulty in this matter, but those not so fortunately placed need not despair, for I have kept fruit perfectly in a disused stable, in a cellar and in boxes in an outhouse.

The worst place to keep apples is in a loft where the air is very dry and the temperature fluctuates suddenly. The ideal store will be dark, cool and slightly moist—not wet—but just moist enough to prevent shrivelling. The best fruit-rooms are built partly underground. When I say that the place should be cool and of equable temperature, I do not mean that the place should be airtight, for a certain amount of fresh air is essential to the health and keeping qualities of the fruit, as many shipowners have discovered to their cost.

For those who have only a few apples to store, boxes or barrels are very satisfactory if the fruits are *packed* in them and not simply dumped in roughly. The later keeping varieties I prefer to wrap in paper before packing in the boxes. Newspaper serves quite well, although oiled paper has, in recent experiments, proved superior. When more experience in the use of these oiled paper wraps has been obtained I hope to be able to say more about them. For the present, I content myself with saying that I have had excellent results with newspaper.

One often hears of apples shrivelling in store. There are two likely causes of this, the first being too dry a store-room and the second picking too early. I cannot give any dates for picking, as these vary with different soils, varying parts of the country and our changeable seasons.

Finally, the principal things to remember are—not to pick before the fruits are ready and to handle all fruits carefully.

THE FLOWER GARDEN

WALLFLOWERS—WHEN GROWTH SHOULD BE HINDERED.

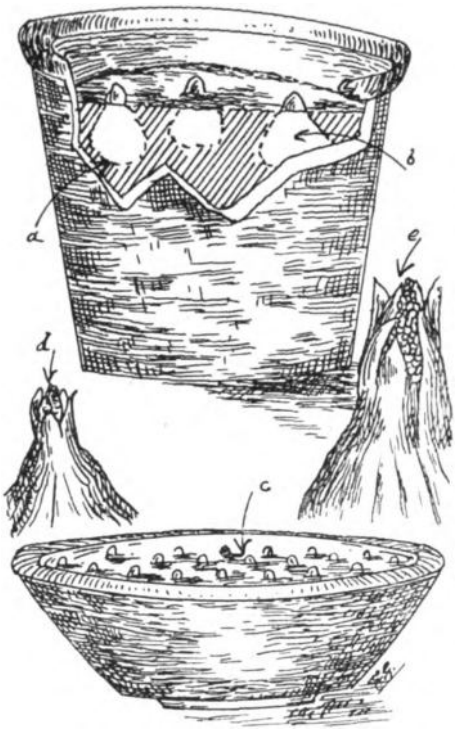
AS a general rule, June is quite soon enough to sow seeds of wallflowers in most districts, but in many localities, whether from fear of being late or a desire to get seed sowing over, one notices that sowings are made in the first or second week in May. This is not all; the seed bed is sometimes one which was manured for a crop previously and, as a consequence of this and to their being given a generous soil where pricked out for the summer, September finds the plants (especially should a spell of wet weather intervene), abnormally large.

Size is no criterion of strength in the matter of wallflowers, and plants, which to some people appear to be very promising because of their forward state, are in reality not so, as invariably they are the first to feel the effects of a sharp frost or two, which kills the centre shoot, and before the winter has far advanced, the borders have the appearance of plants which might have been treated to hot water and been scalded.

Stiff, compact, shrubby plants of moderate size are always preferable to larger ones, among which there is more likelihood of failures. The question which suggests itself in September in the case of over-large, exuberant plants of wallflowers, is whether it is possible to retard them for a time and so miss much of the risk of havoc by frost. My experience prompts me to answer in the affirmative. Most of us who grow wallflowers endeavour, I imagine, to get them into their final quarters, either just before, or just after bulb planting has been done in November. Between now and that time, it is possible to backen or retard them, so that when shifted finally, they will not be leggy or too robust. It can be done in this way: Lift these large specimens and replant them in the same place; they may, and probably will, flag for a few days, but will recover. It will stop them in their career, and to use a common expression, "they will stiffen," but by spring will be strong and bloom as well as those more compact. This plan was forced upon me years ago, after previous failures, but I have learned since that so far as I am concerned, the first, or even the second week in June is early enough for the sowing of wallflower seeds; furthermore, I have come to the conclusion that manured ground is more likely to hinder than help the grower in the long run; that, as a matter of fact, manure is not needed at all! As with some other garden flowering plants, plain living in the case of these, the sweetest of spring flowers, meets their case, and is sufficient to ensure a profusion of blossoms from plants in the picture of health.—CLAREMONT.

BULBS IN POTS AND BOWLS.

MANY kinds of bulbs are very accommodating and may be grown where there is not any garden, if suitable receptacles and soil can be obtained, and light windows are available in a dwelling house. Hard-forced bulbs are not very satisfactory when there are flowers—not very rich in colour—and only puny leaves. Of course, there is a suitable compost, sweet and clean, that nearly all florists sell at a reasonable price, and this compost can be placed in the bowls or flower pots direct and the bulbs planted forthwith. But there is another way of doing these things, namely, potting or boxing the bulbs in the usual way, plunging them under sand or ashes in the open air or a cold frame and lifting, potting or placing in the bowls when they have made a few inches of growth. Associated with tiny ferns in large bowls—somewhat shallow—quite a miniature bulb garden may be created in a few days in the hall or dwelling room. The growing bulbs when ready, are lifted with tufts of compost adhering to the roots and carefully replanted in the pots or bowls and, with ordinary care, they will continue to grow and flower well in due course. At *a* and *b* bulbs are shown potted in a large pot; and at *c* they are shown newly placed in a bowl. Empty, inverted pots may be placed on these till new leaves appear and not be taken out of the house. At *d* a crown is shown malformed from under



course ashes; at *e* one is shown growing normally, taken from beneath an empty covering pot.

THE GREENHOUSE

PLANTS TO WINTER ON GREENHOUSE SHELVES.

DURING the dull days of winter the shelves in the hothouse are in the lightest part of it. On shelves plants are less liable to damp off than they are on stages lower down or on the floor. So we should select the most succulent stemmed and leaved ones for placing on shelves; also those that thrive best in a sunny position. Schizanthus plants are delightful in spring and to secure the best specimens then we should place the plants on warm, sunny shelves during the winter, where they will also receive ample ventilation. Many people still have a fondness for zonal pelargoniums as summer bedding-out plants. The chief drawback in their case is their liability to damp off in the winter unless they are grown in well heated structures. The shelf is the best position for all autumn-struck cuttings. There are lower shelves as well as high ones and on these marguerites and lobelia, heliotrope and young fuchsias will do splendidly. While older cyclamen are better on stages, young ones do best on shelves. Primulas, cinerarias and calceolarias are all suitable subjects for the cool shelf. When bulbs are taken from the ashes and cold frames, they do very well indeed on shelves about 15ins. or 18ins. from the roof-glass. Crassula coccinea does well on shelves high up and sunny. Then there are the plants that are needed to furnish shelves so that they will form a part of the general ornamental arrangement. For this purpose Isolepis gracilis and Panicum variegatum are suitable for shelves in a greenhouse and Tradescantia zebrina and Asparagus Sprengeri are for shelves in a stove temperature.—G. G.

CALCEOLARIAS FOR THE FLOWER GARDEN.

THESE are not grown as generally now as in former years, but there are many lovers of the pure golden flowers who grow plants regularly every year, as I have observed. One drawback to the growth of the plants is the liability of many to die off suddenly about mid-summer or a little later and so cause gaps in the beds. This trouble, however, can be avoided. In the first place the cuttings should be inserted in a sandy bed of soil—three parts sand—in a cold frame in September. The right cuttings are those taken off as side slips as near the base of the plant as possible. When the cuttings are inserted they must be watered and shaded till a callus forms, as rarely do roots form before the month of February, then they grow rapidly. This condition of each plant is easily ascertained as the points begin to grow. In due course 1in. should be pinched off to cause side shoots to form. Of course, where spring bedding-out is the rule the borders will not be available before the end of May and calceolarias must be planted when the other subjects are. But to be quite successful with them and avoid loss through early dying off at the soil level, the plants should be finally planted out early in April in the south and near the end of the month in the north. Plant just as deeply as when they were inserted as cuttings. By the middle of June the plants will be well established and continue to grow throughout the summer.—HANTS.

IXORAS.

VERY few stove plants are more valuable for either decorative or exhibition purposes than are ixoras. As small plants with from one to half a dozen trusses of bloom, few plants can excel them during their period of flowering; while as large specimens, with rich, deep green foliage and noble heads of fragrant flowers, they present a most imposing appearance.

Ixoras cannot be successfully grown unless a high temperature and moist atmosphere can be given during the summer, which is their growing season.

They are readily propagated from cuttings made of short-jointed, half-ripened wood, about 6ins. in length and inserted firmly in small thumb pots in a mixture consisting of leaf-soil, peat, a little fibrous loam and a liberal proportion of sharp silver sand. Plunge the cuttings in bottom heat in a propagating case and very soon roots will be emitted. When ready, transfer to pots a little larger, and eventually into 5in. pots, using a compost similar to that described for the cuttings. Well grown plants in this size pot are useful for table decoration, while medium sized plants with six or seven trusses of flower are of use for many decorative purposes.

The next shift from the 5in. should be into a 6in. pot and future moves must be at the discretion of the grower, according to

Digitized by Google

the size of the plants he requires, but large shifts should be avoided as this results in sour soil and unhealthy plants. When potting these plants it is essential that ample drainage should be provided.

During the growing season afford plenty of heat and syringe frequently. A little liquid manure may be given when the plants are established. Any very vigorous shoots should be stopped.

Should fly, thrip or mealy bug make an appearance, sponging or vaporising must be at once resorted to.

This treatment should continue with shade from bright sun until September when the plants should be placed near the glass in full light and syringing gradually discontinued. The supply of water may also be lessened, but never to cause flagging. The object of this treatment is to ripen the wood formed during the summer.

From October to February reduce watering and the temperature may fall to 60 degrees or 55 degrees, as this is the resting period. About March increase the temperature by degrees to 75 degrees or 80 degrees, and, of course, watering at the root must be increased as growth commences. Use the syringe freely until the blooms show, then maintain a drier atmosphere and a cooler temperature to preserve the flower.—T. H. E., *Kew.*

FRUIT AND VEGETABLES

PREPARING GROUND FOR FRUIT TREES.

IF the intending fruit grower fully realised the importance of thorough soil preparation necessary for successful fruit culture, he would not hesitate to spend time and money on the work. Fruit trees are not like lettuces or even strawberries, which occupy the ground for a few weeks or three years in the case of the latter at the outside; they are expected to remain fruitful for many years. Soil improvement can be effected after planting, certainly, but the foundation must be laid before any trees are planted. Planting should be carried out from October 20th to the end of November, where the conditions of the soil and other matters permit. Trees planted then are much superior in growth afterwards than those planted in spring. During the month of September the soil should be trenched quite 3ft. deep; it does not matter how light the soil may be, it is advisable to trench it and then allow it some time to settle down before the trees are planted in it. The planting, too, should be done while the soil is fairly dry, if possible. In the case of orchards where trees are grown in plantation form, the whole of the soil should be trenched. Where isolated trees are grown, as is mostly the case in small and suburban gardens, a space quite 6ft. in diameter should be dealt with in this way. Some soil should be taken out to the required depth, the remainder trenched and that first taken out placed in to fill up. Thoroughly break up the sub-soil and leave it below; if there are stones in the ground, leave them there; on the top let the soil remain lumpy, it will crumble in due course. At least one peck of wood ashes should be mixed with the surface portion for each tree.—GEO. GARNER.

THE PARASITIC "SUCKER."

THERE are few grafted fruit trees that are not subject to the development of "suckers," at the roots or upon the bole of the stem just under or above the soil—this is especially the case as the tree grows older. The state of the soil, the stock upon which the tree is grafted, and neglect by the owner are other influential factors in the production of unwanted shoots. The latter are a source of danger to the tree, not only from the fact that they represent efforts of the wild stock to assert itself but they harbour and assist insects in their attacks upon the tree. If mildew or American blight attacks the tree, it will probably be the "suckers" upon which the disease is first introduced. Left to themselves, the root "sucker" shoots will multiply and flourish

A COLONY OF "SUCKERS" WITH A ROOTING SYSTEM ALL THEIR OWN.

for several years around the tree, to its great detriment; while those springing from the tree above ground will eventually dominate and kill the fruit-bearing branches.

It is essential, whether these things happen or not, to remove "suckers" of any kind from fruit trees. I have noted many instances

THE MASS OF SHOOTS AND ROOTS CAN BE REMOVED BY A CLEAN CUT FROM A SHARP SPADE.

where their presence has been ignored. Other cases occur where the "suckers" are simply cut out with a knife, maybe just below the surface of the soil, the user of the knife thinking he has got rid of the nuisance; but he is woefully mistaken every time, and under such treatment "sucker" removal becomes a regular yearly operation.

It is best to get down to the root of the matter—literally and practically—and eradicate the trouble once for all. Excavate the soil around the affected tree in the neighbourhood of the "sucker" colony, exposing all its ramifications, and it will be found that a long-standing growth has a root system quite independent of the tree, and of no use to the tree. It of little use to remove the shoot without its roots, therefore cutting out is waste of time.

If the excavation is done carefully, none of the proper roots of the tree need receive injury. It may be found that there are but few tree roots around the "sucker"-infested spot, the "sucker" roots having taken full possession.

When the earth around the "sucker" mass has been removed, it will be seen how and where the mischief has started and the place where the "sucker" is attached to the tree stem. The blade of a sharp spade inserted between the trunk and the mass of roots will make a quick, clean and complete severance. If the cut is not even, however, it should be trimmed with a sharp knife. Around it afterwards, in place of the "suckers," will probably form a mass of fibrous roots that will nourish the tree and make it fruitful.

It often happens that a long, thong-like root will turn its end up towards the surface of the soil and push through as a "sucker." It is best to dig and track this offending root to its junction with the tree and clear it out of the way without mercy. This applies even more to rose trees.

After removal of the "suckers" fill in the hole with good soil and place over the roots a mulch of rotten manure to encourage the formation of fibrous roots of good character. —H. A. DAY.

SPINACH BEET.

THIS most useful green-top vegetable came through the last winter splendidly. The roots were, naturally, very much depleted of any sign of greenery, but they remained, nevertheless, sound, and as the days begun to lengthen new growth soon showed itself in the form of a host of young leaves. For some time now fairly heavy gatherings of this foliage have been made, and will continue to be so, the leafage being in constant demand as a green vegetable. Later on this kind of spinach will give place to what is known as summer prickly spinach —a choicer production than the former. There is also a winter type of prickly spinach, but it is not hardy enough to withstand severe winters on cold soils—hence our resorting to spinach beet, or perpetual spinach as it is sometimes termed. As much of the usual winter green stuff often gets badly crippled in prolonged cold, damp winters, it is a wonder this leaf-beet is not more relied upon, for no matter how harshly the winter deals with its tops, the rootstocks always come through unscathed and are quickly refurnished as the winter passes. It is this feature which makes spinach beet a substantial help in the kitchen during the early days of the year when other vegetables are on the wane. To be thus available seed should be sown in August or early September. —C. TURNER.

CATALOGUES RECEIVED.

Messrs. Dicksons, Limited, Chester. An illustrated catalogue of choice and selected flowering bulbs. Vegetable seeds for autumn sowing, garden tools and requisites are also listed.

FOREIGN.

Messrs. Walter Blom and Son, Limited, Hillegom, Holland. A catalogue of Dutch bulbs of all kinds. Numerous varieties of narcissi and tulips of every type are included, and the hints on the positions in which each variety should be planted and their adaptability will be found most helpful.

MORE ABOUT THE SOUTHPORT SHOW

ROSES.

IN conjunction with the Southport Floral Fête, the National Rose Society held their Jubilee Show. The standard of the roses exhibited reached a very high average. They were, indeed, considered by many to be the finest ever staged in the provinces at this time of the year.

Messrs. S. McGredy and Son had some good seedling roses, three of which, named Sir David Davis, Portadown Yellow and Patience, received certificates of merit. Another seedling rose, named Mrs. G. A. Wheatcroft, was shown by Messrs. Wheatcroft Bros. Margaret Bulkeley, a flesh pink variety, shown by Mr. S. Dickson, was awarded a silver-gilt medal. Messrs. Bees exhibited two beautiful varieties, J. C. Thornton (scarlet) and Hon. Violet Douglas Pennant (blush). Princess Charming was one of the good new varieties exhibited by Mr. T. Hancock. Both Mr. Elisha Hicks and Mr. George Prince's had magnificent displays of well grown roses. Clovelly, one of the best pink bedding roses; W. F. Dreer, a golden yellow rose, delicately shaded with deep peach; and Joanna Bridge, with its straw yellow blooms, were three varieties in excellent condition shown by Mr. Hicks. Angele Pernet, with its vivid orange yellow blooms and glossy green foliage, was outstanding among Mr. Prince's roses. Messrs. Wheatcroft Bros. had fine blooms of Shot Silk, Lady Inchiquin and the pure white Mrs. Herbert Stevens. Almost every exhibitor included Betty Uprichard in his collection. Mr. Robinson among his exhibit of decorative roses, had a particularly good group of this variety. Mr. Gregory staged a splendid collection of autumn roses, many of which such as George Dickson, were in perfect condition. Roses were also shown by Messrs. Dobbie and Co., and some beautiful baskets of roses were arranged by Mr. T. Smith, Mr. J. Mattlock and Mr. H. Drew.

ORCHIDS.

Among the gorgeous display of greenhouse plants, the orchid groups attracted particular attention. Most of the orchid specialists, such as Messrs. J. and A. McBean, Messrs. Charlesworth, Messrs. Stuart Low and Messrs. Sanders, all brought interesting collections and a number of good new varieties. Messrs. J. and A. McBean won the Challenge Trophy for the third time. Beautiful blooms of Cattleya aurea and C. Enid alba were to be seen in their stand. Lælio-Cattleya Carmencita, a fine hybrid, was shown by Messrs. Sanders. Several awards were given to Messrs. Charlesworth's orchids, and among them were Miltonia William Tell and Lælio-Cattleya Marina. Cattleya Suavior var. Excelson, shown by Messrs. Stuart Low was awarded a first-class certificate.

In the amateur section Mr. Adamson excelled and gained a number of awards for his fine orchids. The amateur trophy went to Mr. G. V. Llewellyn, whose orchid exhibit was excellent, and for a group of orchids the Hon. George Vestey won the first place.

TROPHIES.

The People Trophy, for most meritorious non-competitive exhibit.—King's Acre Nurseries.

Sir John Brunner Trophy for most meritorious competitive exhibit.—Messrs. J. Cypher and Sons.

Southport Corporation Trophy for best rock or water garden.—Messrs. T. R. Hayes and Son.

Southport Cinema and Variety Theatres' Trophy for best group of miscellaneous and fine foliage, in Class 2.—Messrs. J. Cypher and Sons.

Rowntree Trophy for best collection of tree or perpetual-flowering carnations.—C. Engelmann, Limited.

J. P Rudolf Trophy for best collection of tree or perpetual-flowering carnations in Class 6.—Messrs. Keith, Luxford and Co.

Southport Boarding and Apartment House Proprietors' Association Trophy.—W. H. Woolman.

Sir Albert Stephenson Trophy for best collection of gladioli, primulinus, or primulinus hybrids only, in Class 9.—Bees, Limited.

Southport Chamber of Trade Trophy for best group of herbaceous, etc., plants and flowers or cut blooms of annuals, etc.—Bees, Limited.

Councillor Hartley Trophy for best exhibit of orchids in Class 14.—Messrs. J. and A. McBean.

Messrs. Clay and Son Trophy for best display of violas and/or pansies in Class 15.—J. H. Milner.

Messrs. Thompson Brothers, Southport, Trophy for best exhibit of sweet peas in Class 24.—Messrs. Herd Brothers.

Southport Hotels and Hydros Trophy for best decorated table of fruit in Class 36.—The Duke of Newcastle.

Mayor of Southport's (Councillor E. Hadfield) piece of silver plate for best exhibit of twelve bunches of grapes in Class 37.—The Duke of Newcastle.

Hon. G. E. Vestey Trophy for best exhibit of orchids in Class 78.—G. V. Llewelyn.

Mrs. J. Rayner Batty (Southport) Trophy for best exhibit of sweet peas in Class 97.—J. A. Grigor.

Southport and District Licensed Victuallers' Association Trophy for best collection of vegetables in Class 239.—W. Robinson.

AWARDS TO NON-COMPETITIVE EXHIBITS.

Large Gold Medals.—Messrs. James Carter and Co., for lilies, etc.; King's Acre Nurseries, for fruit trees in pots; Messrs. Isaac House and Son, for scabious; Messrs. Charlesworth and Co., for orchids; Messrs. J. Peed and Son, for stove and greenhouse plants; Messrs. W. H. Simpson and Sons, for hardy flowers; Messrs. Sutton and Sons, for gladioli; the Hon. Vicary Gibbs, Aldenham, for vegetables; Mr. W. J. Unwin, for gladioli; and Messrs. Dickson and Robinson, for dahlias.

Gold Medals.—Cheadle Mental Hospital, for a miscellaneous group; Messrs. Daniel Brothers, for hardy flowers; Messrs. Dobbie and Co., for dahlias and potatoes; Messrs. E. Fairbairn and Sons, for phloxes; Mr. H. J. Jones, Lewisham, for phloxes; Messrs. Mahood Brothers; Messrs. L. R. Russell, for clematis; Messrs. T. Rivers and Son, for fruit; Mr. T. Smith, Newry, for hardy flowers; and Messrs. Alex. Dickson and Sons, for roses.

Silver-gilt Medals.—Messrs. Allwood Brothers, for carnations; Messrs. Backhouse, for alpine plants; Messrs. Blackmore and Langdon, for delphiniums; Mr. H. Clark, for hardy flowers; Mr. Robert Hayes, for alpine plants; Mr. Johnson; Messrs. Kelway and Son, for gladioli; Messrs. Stuart Low and Co., for carnations and orchids; Messrs. Maxwell and Beale, for hardy plants; Mr. Amos Perry, for aquatics; Mr. E. J. Rigg, for alpines; Messrs. Toogood and Sons, for gladioli; Messrs. Sutton Brothers, for orchids; Messrs. Webb and Sons, for gladioli, etc.; Mr. W. Wells, jun., for hardy flowers; Messrs. Wood and Ingram; Messrs. Waterer, Sons and Crisp, for hardy flowers; and Mr. John Forbes, for pentstemons and phloxes.

GARDENING OF THE WEEK

FOR SOUTHERN GARDENS.

THE FLOWER GARDEN.

For fine bold groups the eremuri have few equals, and some should be grown in every garden of reasonable dimensions. Now is the time to make a start, and old clumps may be divided. These plants enjoy a sandy loam and should be placed at the back of the border, where their tall massive spikes will be most effective. The roots ought not to be exposed any longer than is really necessary.

Sweet Peas.—About the middle of this month seeds may be sown, and from this sowing fine sprays of flowers can be expected in due season. Sow thinly in pots or boxes and winter the plants in a cold frame, admitting air both day and night when the weather is mild. Keep a watch for mice and slugs.

General Remarks.—The shoots of border carnations layered some weeks ago will soon be ready to take up a separate existence. When they are severed from the old plant, they can either be potted up and wintered in a cold frame, or placed in their final quarters. The latter is the best plan in country districts, and the soil should be improved by adding old mortar rubble and well seasoned soot.

Evergreen Shrubs can be transplanted during September and October or in late spring, and where it is decided to move any specimens in private gardens, such work is best carried out in the autumn. If there is still a little mildew on some roses, these should be sprayed with sulphide of potassium. It is unwise to ignore mildew even near the end of the season.

THE KITCHEN GARDEN.

During the last week I have heard of several cases where the late or main crop of potatoes is making a second growth, and often a remedy is sought. There is only one thing to do: lift them at once. Where the tubers are taking their normal course and no disease is present, it is best to allow them a few more weeks.

Vegetable marrows are very susceptible to injury from early frosts, so when a drop in the temperature is expected all fruits that are ready should be cut, and the plants protected with a few evergreen boughs. Runner beans should be picked closely as the cold nights advance. Brussels sprouts are growing freely, and "buttons" are already formed; collect all dead and decaying leaves and bury them in a trench. Continue to earth up leeks, and mustard and cress should be sown fortnightly in a cold frame. Radishes may be afforded similar treatment. Outside tomatoes ought to be gathered and the green fruits will ripen on a greenhouse shelf or sunny window, or they can be made into chutney.

THE FRUIT GARDEN.

Hardy Fruits.—No further time should be lost in making new plantations of strawberries, and the roots of raspberries are all the better for being planted early.

When peach and nectarine trees are relieved of their fruits, the necessary pruning can be carried out while the weather is still congenial. Remove as much old wood as possible, and tie in the current year's shoots, at the same time prevent overcrowding. Specimens that have produced a heavy crop will be benefited by a soaking of liquid manure.

Where it is intended to plant peaches and nectarines during the coming season, it will save time later on if the stations are prepared forthwith. No manure will be needed if the soil is in good heart, but there are few places where lime or old mortar rubble will not be an advantage. All stone fruits need lime. Trench the ground and see that the border is well drained. If the soil is poor, add fibrous loam, which is preferable to manure.

Towards the end of the month grease bands should be placed on the trunks of apple trees.

This season the Japanese wineberry has been very profitable, and a few plants are worth growing to furnish ripe fruits after the loganberries and raspberries are over. The Himalayan berry is also prolific; it is a robust blackberry and should be planted where there is ample space. This plant produces fruit from the old wood for several seasons, a point to be remembered when pruning.

Chepstow. T. W. BRISCOE.

FOR NORTHERN GARDENS.

THE KITCHEN GARDEN.

Potatoes.—To judge from local conditions, those who were wise in time will now have reason to consider the labour involved in spraying the potato crop a good investment. Under present circumstances no good thing can result from leaving them in the ground longer where they are exposed to influences of a destructive nature. And the job is pleasanter to do when the soil is comparatively dry and the tubers come up clean.

There is no new method recorded for storing potatoes, and the old practice of storing sound tubers in the most convenient dry, frost-free places still holds good. And, of course, those tubers of suitable size will have special attention in "gathering" and storing to form sets for replanting. Needless to say the haulm will be cleared off and burned at the earliest opportunity.

Carrots.—The main crop, as it shows signs of maturing, will be lifted and stored. It is a well known axiom in horticulture that frost has an injurious effect on these and excessive rain causes the roots to crack, especially on a heavy soil. Later sowings, given light protection when needed, can be left for present use and will be appreciated in the young state of unimpaired flavour.

Beetroot.—From a bad beginning these have made a satisfactory growth, sufficient to warrant the turnip-rooted sorts being carefully lifted and stored. In this district the best varieties of these are largely superseding the long-rooted kinds, owing to their ease in culture and their adaptability in culinary use, without appreciable loss in colour, crispness and flavour. From experience, their keeping qualities are beyond reproach.

FRUIT UNDER GLASS.

Peach Trees from which the fruit has been gathered may have some of the old wood removed with advantage to the remaining young growth. This should be kept clean by frequent hosings, so that it may derive the greatest benefit from the maturing influence of the light, and see to it that the trees do not lack water at the root. If, too, there is a scarcity of food elements in the soil, it will result in the formation of weak flower buds. Young trees, if making excessively gross wood must needs be slightly root pruned. Given a circumscribed area and a firm medium-rich soil it will be found that the growth of young trees, efficiently handled, will just be sufficient for the formation of a sound basis on which to produce fruit in after years.

Vines Bearing Fruit.—The attendant should study the state of the weather each day. The needs of the vines are air without draughts and any inclemency of the weather, with absence of solar heat, counteracted by a little warmth in the pipes. Late varieties should be given more heat to help in finishing the berries, with protection to outside borders to carry off heavy rainfall.

Vines from which the bunches have been cut should have the laterals partially shortened to induce the "plumping" of the basal buds. Examine the borders as to their needs and give every facility for the proper ripening of the wood. Many prominent growers take this opportunity of cyaniding the house for the extermination of mealy bug.

The renovation of unsatisfactory borders can be proceeded with, as opportunity permits, and may be summarised as follows. Fork out the soil from the outermost edge of the border inwards, coiling up the roots as met with, proceeding thus as far as circumstances allow. Overhaul the drainage, add to it if advisable, re-cover with fresh strong turf, fill in the space with new compost, of the best loam with the usual addition at discretion, relaying the roots in strata and nearer the surface, if possible. If sunshine prevails while carrying out this operation, spray the outside glass with whitewash or other means of shading and continue this for a time.

Doune, Perthshire. W. MCCARRELL.

CONSERVATORY AND GREENHOUSE.

Trachelium cœruleum.—If seed is sown at this time in a cool greenhouse, the resulting plants will prove useful for early flowering next year. Plants raised from seed early in the year and that have done duty for furnishing the stages, should not be discarded, since, if trimmed back and potted on as they require, they will make fine large specimens for furnishing the beds next season. This plant with its cloud of small bluish-mauve flowers is very elegant and is deserving of more general cultivation, which presents no difficulty as it only requires cool greenhouse treatment and thrives in any good potting compost.

Annuals for Conservatory Decoration.—Seed of the many beautiful annuals, as represented by schizanthus, nemesias, clarkias, godetias, viscarias, etc., should now be sown in cold frames or in a cool greenhouse. Care should be taken to sow the seeds very thinly or damping off may result. Careful watering and airy conditions are very essential in this respect. Pricking off should also be attended to before the young plants become at all crowded. The young seedlings may be pricked off directly into small pots, or into pans or boxes, afterwards potting them up when they have attained some size. Mignonette, which resents root disturbance, should be pricked off into small pots, also such slender growing plants as viscarias, in their case allowing six plants to a pot, afterwards potting them on without disturbance. Schizanthus and plants that are naturally of a bushy habit are best grown singly in pots, also clarkias and godetias, unless large specimens are required, when three or four plants may be placed in a pot. Such plants in time will require 8in. or 10in. pots in which to grow. Annuals, although they may be wintered in cold frames, are better if they can be grown in a cool, airy greenhouse, where they are under closer observation for watering, etc., and suitable atmospheric conditions are under better control; most of them grow freely in any good potting compost, and if the loam is not too heavy they are best grown without the addition of leaf-soil to the compost, growth is then much firmer and sturdier, which is important for bringing them safely through the winter.

Schizostylis coccinea (Crimson Flag or Kaffir Lily) and its rose-coloured variety, known as Mrs. Hegarty, although hardy in warm borders in the south and west, is an excellent plant for greenhouse decoration, when grown in pots. The best results, however, are obtained when it is planted out in the summer in clumps of a dozen crowns that can be lifted entire at this time and placed in a 6in. or 7in. pot. Where this has been done or where a stock of plants is growing outdoors, a quantity should now be lifted and placed in pots. If they are well watered and kept shaded for a few days, they will take no hurt and will give a bright display for a long time.

Lilium longiflorum.—When the bulbs come to hand they should be potted without delay; if for any reason this cannot be done, they should be covered with leaf-soil or fibre, as all lily bulbs quickly suffer if left exposed to the air for any length of time. Plant bulbs singly in 6in. pots, or three or four according to size in 8in. or 9in. pots. As this is a stem-rooting lily, the bulbs should be placed sufficiently low in the pots to allow for top-dressing, or the pots may be filled right up at the time of potting; personally, I always practise the latter method. After potting they may be stood in cold frames, or in a cool greenhouse, or, if so desired, may be started right away in a warm house. Water should be carefully afforded until they have made a quantity of roots and have commenced to grow. They are very subject to attacks of green fly, which must be prevented by spraying with an approved insecticide, or by frequent light fumigations.

Lantana salvifolia.—This plant, in the south at least, makes a fine summer bedding subject, while at this time well grown plants in 6in. pots make a fine display on the stages in the greenhouse. It also is, when planted out, ideal for furnishing pillars in the conservatory, its long slender stems in time attaining a height of 10ft. to 15ft., the whole plant being clothed with a wonderful profusion of flowers for the greater part of the year. Where a stock of plants is required for next year, now is a good time to insert cuttings which root readily in a close propagating case.

Housing Plants.—Hard-wooded plants that have been stood outdoors for the summer should now be housed for the winter; any cleaning, staking or tying that may be required should be done before they are taken indoors. The house should be kept well damped down and the plants syringed for several weeks during bright weather to accustom the plants to the drier atmosphere of the house.

Chrysanthemums.—If not already done, early flowering varieties should be got under glass; to prevent mildew they should be sprayed with sulphide of potassium, using 1 oz. to three gallons of water, taking care to wet the under sides of the leaves thoroughly. Plenty of ventilation should be given, but avoid draughts. During cold weather a little fire heat may be used. Some arrangements should be made for plants which are to be kept outdoors as long as possible.

BURTON-ON-TRENT

We won at the above Show, held 11th and 12th August last, TWO GOLD MEDALS for our WONDERFUL COLLECTION OF GLADIOLI. We offer one Bulb of each variety shown in this collection of 50 different varieties at 8/6, two Bulbs of each variety, in 50 varieties, 16/-, six Bulbs of each variety, in 50 varieties, 45/-. The new and most attractive Gladiolus at the Show called BURTONIA, raised by us and only stocked by our firm, only 500 to offer, 2/6 each.

OUR GOLD MEDAL CROCUSES.

The earliest flowers of Spring Exhibition Mixtures for Naturalising.

	Doz.	100	1000
Mixed purple and blue	8d.	4/6	40/-
Mixed striped	8d.	4/6	40/-
Mixed white	8d.	4/6	40/-
Mixed all colours	8d.	4/6	40/-

Crocus, special selected for Window Boxes, Pots and Flower Beds.

	Doz.	100	1000
Special blue, named	9d.	5/-	45/-
Special purple, named	9d.	5/-	45/-
Special striped, named	9d.	5/-	45/-
Special white, named	9d.	5/-	45/-
Special yellows, extra	1/-	8/-	75/-

EXHIBITION TULIPS.

THE DARWINS.—The most sturdy-growing, strong, upright stems with massive flowers:

	Doz.	100
Bartigon, bright fiery red	1/6	10/-
Clara Butt, clear pink, flushed salmon rose	1/-	7/-
La Notre, rose pink shading to silvery pink, centre blue and white. Extra forcer	2/-	14/-
Prince of the Netherlands, extra large solid flower of perfect form, rich brilliant cerise red, extra strong stems. First-rate bedder	2/6	15/-

The above 7 varieties, 12 bulbs of each, 10/-.

	Doz.	100
Professor Rauwenhoff, deep cherry rose; white base margined blue	2/-	12/-
Princess Elizabeth, extra fine rich soft rose, slight silvery flush at margin, centre clear white	2/-	14/-
Wm. Copeland, violet shading to lilac; when forced the colour is a beautiful soft lavender	1/-	8/-

The above 7 varieties, 100 bulbs of each, £3 10 0

THE COTTAGE TULIPS.—The most graceful novelties:

	Doz.	100
Amber, light amber coloured. Award of merit	1/10	13/-
Erasmus, large creamy white, long stem. Award of merit	1/10	13/-
Grand Yellow, very deep yellow, extra fine	2/-	15/-
Mrs. Francis King, very fine satiny rose	1/10	13/-
Nectar, vivid carmine red with clear white base. Award of merit	2/-	15/-
Spinoea, white flower on very tall stem	1/10	13/-

	Doz.	100
Sirene, the wonderful lily-shaped flower, of a very fine glistening satiny rose. First-class certificate, London, Amsterdam	1/10	14/-
Pearl, finest light rose	2/-	15/-
Prof. Westerdyk, wonderful lilac rose, very tall, splendid forcer	2/-	15/-
Triton, glowing carmine rose, pure yellow base, the most attractive tulip yet raised, a real beauty	2/-	10/-

NOVELTY COLLECTION.

Novelty collection ten extra selected bulbs of each of the above 10 varieties, 100 in all, 10/-.

25 Bulbs each of the above 10 varieties, 250 Bulbs in all, 20/-.

Quality.—All bulbs which are not to satisfaction upon receipt may be returned to us and we will gladly refund money and postage. Complete list of other rarer tulips, daffodils, etc. gladly mailed on request.

H. PRINS, F.R.H.S., Bulb Specialists, WISBECH, CAMBS.

CLIBRANS' HYACINTHS

FOR EXHIBITION.

Monster Bulbs, any colour. 12 in 6 varieties - 10/6
6 in 3 varieties - 5/6
Post Paid.

CLIBRANS, 12, Market St., MANCHESTER.

GARDEN DESIGN is best dealt with in "Planning and Planting of Little Gardens," by G. DILLISTONE, 6/-; by post, 6/6. Published at the Offices of "COUNTRY LIFE," LIMITED, 20, Tavistock Street, Covent Garden, W.C.2.

PLANT PESTS AND PARASITES.—A useful booklet on garden troubles by HORACE J. WRIGHT is to be obtained from the Offices of "COUNTRY LIFE," LIMITED, 20, Tavistock Street, W.C.2; 11d. post free.

Burpee's
NEW SWEET PEAS for 1927

GLADNESS A soft coral-pink, intensified by a suffusion of a deeper shade toward the base of the standard and wings. The softest and daintiest of all pinks. Of exquisite delicacy, enhanced by a lemon keel.

DELIGHTFUL A rich terra-cotta cerise, suffused orange or scarlet-red. A colour never before produced—the most appealing, in its glowing beauty, of all the richer toned varieties; bright and shining even on dull days, and startlingly brilliant under artificial light.

ROYAL BLUE A true Royal Blue, but full of life and brilliancy instead of dull and unspiriting; undoubtedly the brightest of all sweet pea dark blues. A flower of great substance and enchanting beauty, extremely prolific in fours.

Notes from Maidstone.

MATRIMONIAL NEWS

There are journals we believe which bring together those desiring to marry, and now that we learn that some fruits require such introductions, and as they are fastidious in the choice of their affinities, it seems necessary to provide a Pomological Matrimonial Agency. Failing this desirable institution, our Fruit Catalogue must serve as a medium, and the marriages which science has blessed are indicated, where known. Of special interest and rarity are those couples which are mutually satisfactory. All planters of Cherries and Plums should gravely consider this point before making final decisions.

NOTES FROM MY GARDEN—II

AS a correspondent pointed out in THE GARDEN a week or two ago, August is the best month for dividing primulas that have formed a mass of crowns during the year. While doing this I found that in some cases plants had increased to such an extent that they were too large for the pocket in which they were planted and had forced themselves practically out of the ground. P. secundiflora appears to be the most tenacious of life. In many cases six or eight crowns were packed so tightly that one long root per crown was their only anchor to the soil. In such cases great care must be taken that these roots are not damaged in dividing them. In fact, with P. secundiflora the division next year will be done a month or so earlier, so that a root system will have more chance of establishing itself before the winter sets in. As a rule slugs do little damage to well grown Asiatic primulas, but this year I find that they have attacked P. sikkimensis and P. pseudo-sikkimensis viciously. Three plants of the latter have been entirely stripped of leaves. They have also eaten several omphalogrammas to the ground, which is more than a nuisance, as these lovely plants are shy seeders in this country.

This summer in eastern Scotland has been particularly fine and flowers have come and gone with remarkable rapidity. Especially is this the case with shrubs. That being so, the worth of Spiræa bella with its flat panicles of rose flowers is more than proved, for the bloom remains flush over a long period and a group of them has shown a soft rose flush for several weeks. This is by no means the most showy of the spiræas, but it is a graceful bush and it has great value as a late summer and early autumn flowering shrub. Just as important are the various shrubby potentillas, which are excellent plants for a cold garden. Their flowering period is long and the various shades from golden, through citron-yellow to white are charming when the shrub garden is inclined to be dull in colour. It is strange how many gardens are without this excellent and easily grown plant. Unfortunately, with us this is a bad year for berberis berries. Cold nights in May prevented most of the fruit from setting and many bushes that were magnificent last year are without berries this season.

Never have the wasps been so bad. Numerous nests have been destroyed, but there is no diminution in their numbers. For the first time I have seen a plum tree with each plum nothing but a hollow shell, with the pulp entirely consumed by wasps. This has been a particularly good honey year, which is probably the reason for this plague of wasps. Still another pest that has increased enormously is the tall Campanula latifolia. I mentioned it last year in an article on my garden. This was originally introduced as a pleasant plant for the wild garden. Now I would give pounds to be able to eradicate it. It is a terrific grower and forms dense thickets, killing out everything, including dwarf shrubs, in its neighbourhood. Let this be a warning to those who may be tempted to try it. However charming a plant may be, if it turns into a pest it is useless in a wild garden, where control is difficult. After all, one of the reasons for a wild garden is the small expense of its upkeep. When much time and labour have to be spent in eradicating plants that tend to take control, much of the joy of wild gardening ceases. Four plants that should be left out are the polygonum, the campanula, the giant parsnip and the spiny aralia. Cutting is little use; the roots must be dug out bit by bit. I cut down several aralias last spring and where one stem existed before, there are now a dozen. E. H. M. C.

HINTS FROM OUR READERS

THERE is no hobby that is so unselfish as horticulture. Therefore, THE GARDEN asks its readers to give freely of their store of knowledge for the assistance of gardeners in general. It has, therefore, been decided to offer a

PRIZE OF HALF A GUINEA

a week for the best original hint published each week, and to pay 5s. for all others published. These hints must be the result of personal observation and experiment, and may consist of any information on horticultural matters. For instance, some readers may know a short cut in the propagation of a plant; others a method of growing a supposedly difficult plant. Other suggestions are a particular colour scheme, a new way of mending a lawn, how to remove a garden pest, a fresh way of arranging a vase, how to keep weeds down on a path, a new way of cooking fruit, a different situation for a plant, an idea for a time-saving tool. There are hundreds and thousands of hints which will assist the gardener. Will you send in your quota to help the gardening public?

HERE ARE THE ONLY REGULATIONS.

1.—Half a guinea will be paid for the best hint published each week.

2.—Five shillings will be paid for all others published.

3.—All hints must be sent in on a post card addressed "Hints," THE GARDEN, 20, Tavistock Street, Covent Garden, W.C.2.

4.—Only one hint per post card, and no hint may exceed 150 words in length.

5.—No hints, whether published or unpublished, will be returned.

6.—Payment will be made on the 7th of each month following publication.

7.—The first issue to contain these hints will be that of September 25th.

By this means we hope that much information hitherto unobtainable will be supplied by our readers for the common weal.

A FREE AND FORMAL ROCK GARDEN

A FREELY PLANTED ROCK BANK IN A FORMAL SETTING, A COMBINATION OF PARTICULAR CHARM.

IT is both formal and free, this garden I have in mind, and the combination has peculiar charm. As you step out of the French windows of the house, you are standing on the paved garden, long, wide, strictly rectangular. The flags themselves suggest a certain orderly method in their disarray. The low wall that guards them is trim and straight to line.

All else is freedom. The little, Puck-like dwarfs of plant-land thrive and make merry. Wild thyme roves in and about, a chartered libertine. Its breath, in high summer, is a fragrant miracle. Viola gracilis, the white and the purple, nods at her humble neighbour from the crannies on either side, and here and there Silene maritima wanders pleasantly. The sedums revel in full sun-glow, and the Balearic sandwort thrives.

This latter is so brave and joyous a wanderer that it is surprising so little use is made of it in pavement gardens. It should be allowed to cover wide spaces with its tiny, rich green leafage that is a joy the year through. In its flowering time it is a foam of pearly white, hiding the leaves. But whether for its leaf or flower beauty, it is useless to grow it in sparse driblets. Like wild thyme, and all the smallest of the rock-children, it needs ample space if its effect is to be real.

One thought of the mind that planned this paved courtyard is bound to make appeal to the poetry in one. Though most of the crannies were filled by choice and with design, some were left for the winds of Heaven to plant with seedlings. It was a spacious thought, as if some rich manorial lord of other days left certain outbuildings with doors open for such casual vagrant-men as chose to claim his hospitality—guests not of his own choosing, but of the wild's.

The whole scheme of this paved garden is enhanced by the lavender growing all down the side of its low guardian wall. A few steps, crowned by Siberian wallflowers, lead to the rose garden, and this, too, is both free and formal, carrying forward the same underlying *motif*. The rose beds are set among smooth, faultless turf. The lily pool in the centre is austere almost in its simple lines. The straight paths surrounding turf and rose-beds are orderly tracks of limestone chips; and beyond them are straight limestone walls, dry-built, with generous spaces between the rocks.

It is the denizens of these crannies, luxuriant in leaf and blossom, that give the right contrast. The rose-beds and clipped lawns do not seem formal now, but are instinct with a pensive dignity. Before the roses add their own notes of colour, aubrietias are in full bloom. Rosea splendens has Micriana and Potter's Selected on either hand, and the three hues blend most happily together. Close to them Alyssum saxatile runs down its strip of wall in a flood of sunny gold, looking always as if new-washed by rain not long before.

Mother of thousands has its place here. When our grandfathers were young, the tiny, creeping beauty, with its pink-white bloom, crept out of wall crannies into their hearts, as it does into ours to-day. No drought dismays it. In a cared-for garden, or in the clefts of dry, neglected walls, its whole aim in life is to cover nakedness with a persuasive tender grace that is almost human in its wistful courage.

Double arabis, too, is here, flowing in white and green cascades next door to pink Erinus alpinus, and next door again is perennial candytuft, free-branched and profligate of blossom. A little farther on you are greeted by masses of that most beguiling alpine, the pink æthionema, garbed all in fresh, young health and beauty.

Digitized by Google

Above this garlanded wall stands what one may call a woodland belt of broom, ablaze with flower—Genista præcox, I believe it is, though by any other name it would make a glorious background for the wall's simplicity. And in among the broom runs white cerastium, budding fast. The country people name it Snow in Summer, an alluring title.

If I dwell upon the spring aspect of this garden, it is because this is the special festival-time of all rock gardens. High summer by and by will bring the roses. Lilies will rise in gracious array from the pool that seems now to give no hint of the wonder-time to come. The formal turf will be a clipped, weedless joy—an emerald carpet leading to the roses' feet.

The wall garden takes on another aspect now. Its effects are less bold and obvious than in spring; but in detail it has its victories, no less renowned than massed battalions. The rock pinks come to their own, and no flower of the whole year has more grace and winsomeness. It is so simple, so full of friendliness and smiles, and always suggests, somehow, that it is ready-gowned to trip it at some country fair.

When the broom has flowered its heart out on the banks above, great bushy clumps of feathery green have grown in front of it; and these break later on into a riot of alternate pink and white. The mallows have come into their kingdom, and there is a curious charm about this old-fashioned plant that is all too seldom cultivated nowadays. Backed by the slender tallness of the broom, its effect is free, yet trim.

Gentiana Farreri lives in one corner of wall garden. It is not a plant that anyone can grow successfully. It is, indeed, so shy and capricious that I class it among those wayward beauties which need wooing with solicitude and patience before they are well won. But, once won, gentiana has no half measures. She simply thrives. All blue flowers have, somehow, a hint of wistfulness about them, perhaps because they are the emblem of persistent hope. Lingering round Gentiana Farreri there will always be a deeper pathos to those who know that the man who gave his name to it gave his life also in pursuit of his work for alpine flora. It is as though blossoms of remembrance grow, not only on his grave, but in many an English garden corner when gentian blue looks up at us.

To complete the picture of this garden, one must take note of the paths spoken of as bordering the rose garden. They are rectangular and strictly weedless; but choice seedlings from the surrounding walls are allowed to claim a footing if it pleases them. It is astonishing how self-sown seedlings will mature and thrive in quarters where one could not hope to plant with the least success.

Through the limestone chips, violas, blue white and golden, have found root-hold to their liking. The moist freshness of the bloom, in contrast with the Quaker-grey of the chips, is delightful. So is the wild thyme's warm crimson, and bugloss when he sounds his bugles up the spring-time months. Iceland poppies, too, wander in little companies, and farinosa, beloved of all folk, finds ampler blossoms here, and richer colour, than on her native highlands, a mile away up the fells. HALLIWELL SUTCLIFFE.

THE VALUE OF FOLIAGE—IV

IN this article I particularly want to draw attention to some hardy trees and shrubs which, while lacking the brilliant colouring described on some former occasions, are notable for their more sober, but nevertheless beautiful foliage. This group offers a tremendously wide selection and in a short article it is really very difficult to start at all, but, once started, far more difficult to cease writing of such beautiful subjects as, say, Paulownia imperialis.

Young plants of this, grouped at 6ft. apart and cut down to ground level in March each year, will make magnificent leaves on single stems. On plants only planted in April last year and so treated, I measured leaves in the autumn 26ins. by 22ins., the stem being about 6ft. in height. P. imperialis, if allowed to grow naturally, will make a splendid tree, its foliage then being about 8ins. to 12ins. across, according to soil and situation. Another beautiful and very prettily foliaged tree is Ailanthus glandulosa; this, treated as recommended above, will throw enormous foliage, beautifully pinnate and fully a yard in length. Both are deciduous. Laurels and hollies are all useful for their evergreen qualities, but there is just one of each which stands alone for its magnificent covering of greenery, the laurel being Prunus Laurocerasus latifolia and the holly Ilex latifolia, the magnolia-leaved holly of Japan. Both are extra good and well worthy of a place in all large shrubberies. One of the finest berberis for foliage is Mahonia nepalensis from Kashmir, its elegant foliage often reaches a length of 2ft.; it makes a grand shrub and when laden with its large clusters of sweetly scented lemon coloured flowers, backed by the brilliant green foliage, it compares favourably with any other of the berberis family, even B. (or Mahonia) japonica Bealei.

VIBURNUM RHYTIDOPHYLLUM, EXCELLENT BOTH IN FOLIAGE AND FLOWER.

There are many beautiful things among berberis, but I must content myself by describing just the one variety or I shall find myself in the berberis bag and writing many pages, not even leaving space for that beautiful hardy evergreen, Elæagnus japonica macrophylla. This is a remarkable shrub and does well in coastal gardens. It bears large silvery-hued foliage and is always very ornamental. For sub-tropical effect the aralias are most useful subjects, bearing as they do such gigantic bi-pinnate foliage and, being rapid growers, soon filling their allotted space. Some of the varieties reach tree size and make truly remarkable specimens, especially when covered with the large heads of creamy-white flowers. The aralias appear to flourish in practically any soil or situation.

There is just one poplar which stands in splendid isolation from among its many relatives, Populus szechuanica. Its foliage is of great size, often reaching 12ins. in width by 14ins. in length; it is of a beautiful shade of green above, lined with pinky ribs,

Digitized by Google

ERIOBOTRYA JAPONICA IS A CONSPICUOUS OBJECT IN ANY SHRUBBERY WITH ITS LARGE SHINING LEAVES.

and beneath it assumes a delicate shade of pink or blush pink. The current year's wood is also brightly coloured. This tree, when more plentiful in the trade, is bound to be largely planted.

Another deciduous tree which calls for attention is Salix magnifica. This, a native of China, is really good, as it bears foliage sometimes as much as a foot in length of a lovely glaucous green colour, also it gives a certain amount of autumn colouring. My experience with this beautiful willow is that it grows best when well away from water, or wet positions, such as some other willows love. Eriobotrya japonica is a conspicuous object by reason of the very large and shining green foliage with which it clothes itself; individual leaves often measure 18ins. in length by 6ins. broad. This tree is more hardy than generally supposed. I have planted out two-year seedlings in very exposed positions, and although they had their foliage simply blown away, they grew and grew hard, for to-day they are flourishing plants, with foliage like boards and as hard as nails. Some of the older leaves turn a brilliant red in autumn and remain on the plant till springtime. But to see eriobotrya to perfection it requires the protection of neighbouring trees, when its foliage will be at its best; in the very coldest parts of the country it can be grown on high walls. Another newer variety is E. prianophylla; this, so far, appears to be hardy and has distinct evergreen foliage, 6ins. to 8ins. in length, rounded at the end and beautifuly dentated. Several viburnums are good foliage plants, but one variety, V. rhytidophyllum will suffice for this article and is certainly good, both for foliage and flower effect. One warning note: If one wants V. rhytidophyllum at its best, *do not plant* in windy positions. It is hardy, thrives well on chalk and in almost any aspect, its foliage is evergreen, 8ins. to 10ins. in length and up to 3ins. in width and of a delightful shade of dark green, the underside being coated with buff tomentum. I had almost forgotten to mention its autumn attraction—its beautiful fruits, red and black, which remain practically through the winter.

There are very many beautiful subjects which I have refrained from describing only because I feel certain they could not be obtained in sufficient quantity, or if described would lead many garden enthusiasts to try them in positions which would only mean failure.

Some such are Magnolia macrophylla, with leaves *two to three feet in length*. Guevina Avellana, Lomatia ferruginea, etc. There are specimens of such as these in the country, but they are few and far between. Rhododendrons offer us some truly magnificent foliage and the whole family of bamboos are most useful, but I must leave it for an abler pen than mine to describe them. Then comes that most varied, brilliant and easily grown family, the acers. I have already mentioned in my preceding article "A Selection of Maples," on page 456 a number of species and varieties which are well worth introducing to the shrubbery.

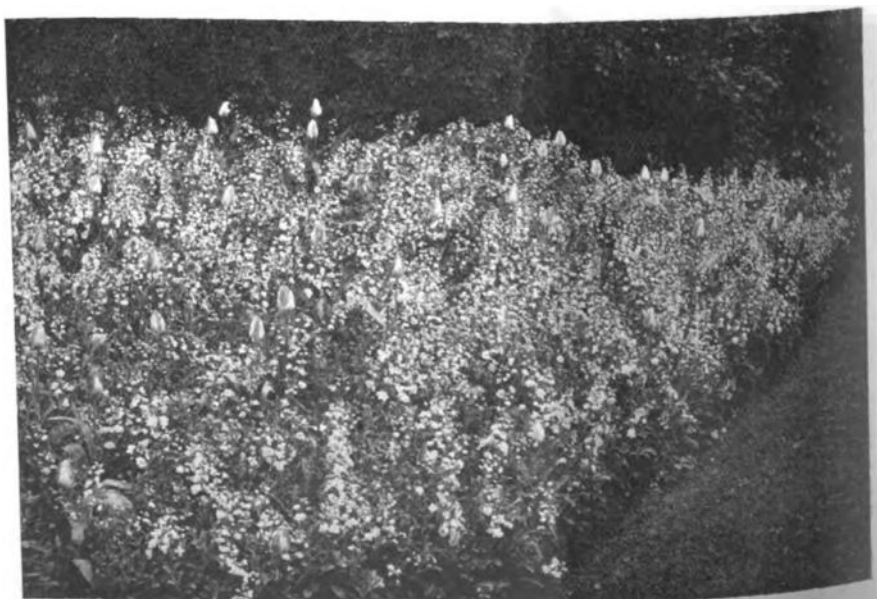
JOHN HILL.

SPRING BEDDING

In this article will be found a few suggested arrangements for the next year's spring garden. The earliest opportunity should be taken to procure the plants and carry out the planting during the next few weeks.

NOW is the time to think about spring bedding. The gardener possesses, and should utilise to the full, the privilege of looking ahead, of turning his back resolutely on the past; and of enjoying, without unduly dwelling upon, his present triumphs. Herein lies one of the secrets of successful achievement. Plan six months ahead and, more important still, do not be turned aside from your plan once it is made. The delights and distractions of modern gardening are so numerous that the temptation to daily with catalogues, to grow twenty things inadequately rather than half a dozen well, is almost overwhelming. But this temptation must be resisted with all the force at one's command, and especially in this matter of planning designs for bedding.

Summer bedding should be cleared by the beginning of October; the beds should be dug, manured and generally prepared for the spring show. It is a mistake to delay this work too long. The fact that the beds are going to look



A SPRING BED OF TULIPS WITH A CARPET OF DOUBLE ARABIS.

Digitized by Google

bare and unattractive for many months ought to have been faced when the beds were made originally, and spring plans should not be jeopardised on this account. Well stocked and well planned spring beds are a wonderful delight and are worth some sacrifices in the late autumn.

Variations without end can be played upon the fascinating theme of spring flowers, the only stipulation for success being, as I have said, that the variations should be developed in the early autumn and not left to mature until a few weeks before the effects are wanted.

The following are a few designs that have been tried with success; details may be changed and one flower substituted for another without upsetting the general scheme of colour and effect.

(1) Lemon-white and orange-coloured primroses, bordered with mauve violas, were intermingled with mauve and silvery pink tulips. This charming scheme was used in four long beds cut in grass surrounding an old grey stone sundial. The beds were seen against a yew hedge on one side and an open wood trellis on the other.

(2) A second scheme tried in the same beds consisted of lilac primroses, aubrietia and pansies. This gave an effect of level, unobtrusive colour which was exceedingly charming.

(3) For late spring, white Canterbury bells with a carpeting of silene (dwarf pink campion) are charming. They flower in June and July, and gladioli should be planted between the bells in spring to ensure a succession. Hardy chrysanthemums may be substituted for gladioli. The Canterbury bells should, of course, be planted in autumn.

(4) Wallflowers and narcissi combine beautifully in spring beds. Good varieties of wall flower are Cloth of Gold, Primrose Monarch, Purple Queen, and Eastern Queen (apricot).

(5) Most bulbs are excellent for spring bedding. A slight variation in the use of bulbs is a combination of primrose yellow hyacinths planted alternately with narcissi, the whole having a carpeting of arabis.

Single hyacinths produce finer spikes and are more reliable in the open ground than double varieties.

Where the cost of bulbs for beds is found to be somewhat heavy, a carpeting of myosotis, silene or arabis is very useful; again, large distant beds need not be planted so thickly as beds in the immediate foreground.

Speaking of bulbs, double tulips are not grown as much as they deserve to be. They are more economical than single varieties, as they fill more space, and they have a longer flowering period. The yellow varieties are specially pleasing.

(6) Polyanthus primroses in white, yellow and orange look well together, and they might have a carpeting of double white arabis which will balance the heaviness of the primroses.

WILD GARDEN CONSTRUCTION

LET us picture to ourselves an undulating area of woodland with open grass glades, as indicated in the diagram.

The higher ground lies to the western side of the pathway shown, with a low dell-like valley separating two mounds, (A) and (B). The mound (B) slopes gently into flat terrain underneath some sycamores in the south-west corner.

The entrance is on the north side. An iron paling (indicated by the dotted line) forms part of the boundary, behind which lies a bank of laurels. A bold hedgerow forms the western boundary.

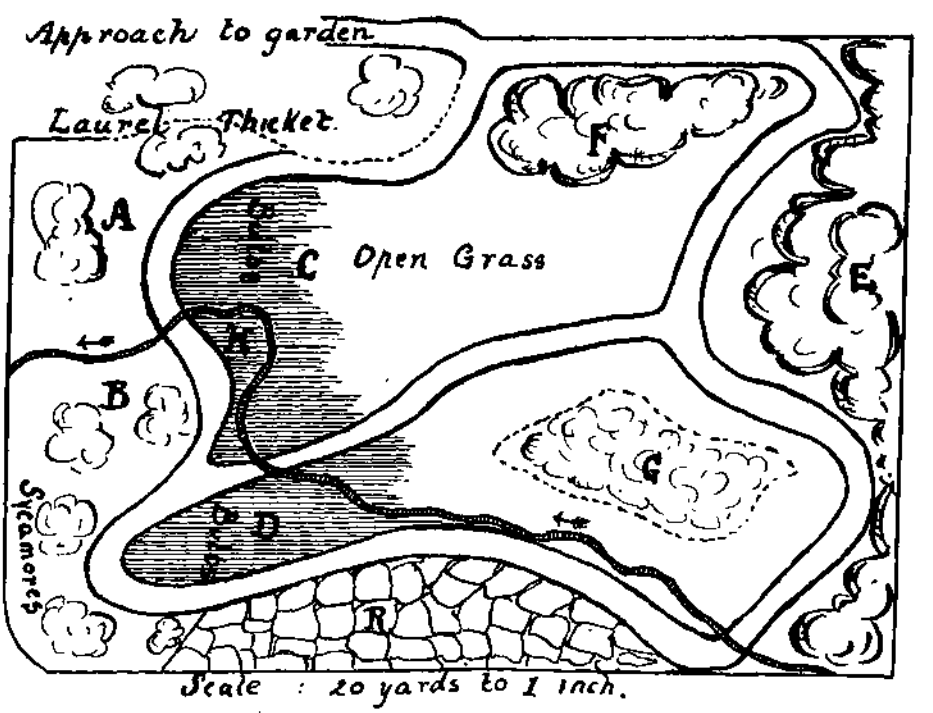
A large rockery (R) forms an outstanding feature on the southern side, which is bounded by a stone wall throughout.

The slopes (A) and (B) are planted informally with lilacs, syringas (philadelphus), buddleias and privet as a background, in front of which stand deutzias, forsythias, euonymus, common yellow broom and evergreen shrubs, including aucubas and butcher's broom. For the grassy slopes we require naturalised bulbs and wild garden plants such as primroses, ferns, American cowslips, giant cow-parsnip (heracleum), bluebells, daffodils, crocuses, scillas and snowdrops—the smaller bulbs strewn about the lower parts in irregular waves. Odd clumps of bamboos (Arundinaria nitida and A. Falconeri) add picturesqueness to the scene.

The low-lying parts (C) and (D) are suitable for more naturalised bulbs, such as bluebells and daffodils, sown broadcast. Dotted clumps are to be avoided in such sites. In the small patch (H) moist and swampy soil, irises would do well—*e.g.*, the yellow water flag (I. pseud-acorus), I. sibirica and I. germanica. The Gladwin iris (I. fœtidissima) and Butomus umbellatus (flowering rush) with water forget-me-nots would also be suitable.

Water is provided by the stream shown on the diagram.

In the plot marked (G) is a clump of Berberis Darwinii, with spiræas and isolated gorse bushes. In the south-east corner are some evergreen oaks which serve to shade this corner. The space marked (E) is also planted with shrubs spiræas, buddleias, elderberries, May trees, laurels, silver birch, lilacs and laburnums.



It is most important in the planting up of a wild garden that consideration be given to a selection of suitable shrubs, only those kinds should be introduced which require little attention in the way of clipping and grooming, and give every year a fine display of flowers. There are many shrubs which require space to show off their beauty, and these will give most satisfaction in the wild garden. The spiræas certainly ought to be included as they are most decorative in flower and foliage.

The eastern wall is constructed of stone, with rough coping, which serves as a bed for wall ferns, Cherianthus Allionii and valerians. The northern boundary is likewise a stone wall, but somewhat lower than the others, allowing a view over the adjoining fields.

The corner (F) is planted with shrubs and trees similar in character to those in the space (E).

E. A. SAUNDERS.

NOTES OF THE WEEK

ROSA WICHURAIANA.

BECAUSE it has been eclipsed in brilliance of colour by the many well known hybrids raised from it, R. Wichuraiana does not, I think, enjoy the esteem it deserves. At this season in particular it can put up a good claim for admiration, for it is one of the latest of all wild roses to flower and it will continue in bloom until practically all the aforesaid hybrids are over. But, apart from this, R. Wichuraiana stands almost alone in habit of growth, it being a creeping, or entirely prostrate, species—which means that it is of unique value as a shrub for covering slopes, rocky banks, low walls and the like. I have also grown it successfully among the dwarfer heaths through which the long slender branches thread their way for 15ft. to 20ft., tossing out at intervals an elegant panicle of snow-white flowers. Individually the blooms are about 2ins. across; they are delicately fragrant and a succession will be maintained from August until autumn is far advanced.

The foliage of R. Wichuraiana is evergreen and abundant, and the fresh glossy green, admirable at all seasons, makes an effective setting for the blossoms. A very robust and generally healthy rose (I have never known it to suffer from aphis or mildew), it will thrive in the poorest of soils, and annual growths of 10ft. are by no means uncommon even on my hot and shallow loam, which it shares with such good drought-resisters as double gorse, Erica cinerea and the lesser brooms.

R. W. var. rubra, which has flowers of a deep rose-crimson, I rather think is a pretty impostor. For though it may contain the "blood" of the true species, it is very different, not merely in colour but in foliage and habit. It sulks where the other prospers, it has a strong inclination towards an upright growth and, with me at any rate, it never escapes mildew. All of which makes one think that they are right who consider it to be no more than a hybrid between R. Wichuraiana and the old Crimson Rambler.—A. T. J.

SOME FORMS OF THE RED CEDAR.

OF the tree-like junipers which may often be met with in our parks and gardens, the Chinese juniper and the North American red cedar are the best and most ornamental. In Continental gardens the upright form of Juniperus chinensis is rarely seen, and this excellent and hardy species is mostly represented by the variety Pfitzeriana, that forms very broad pyramidal bushes with horizontally spreading branches and nodding tips. The low procumbent variety of the Chinese species, too, is rather common in middle Europe under the name of J. procumbens. By A. Henry and other authors it is, probably rightly, regarded as a good species.

Of the red cedar the tree-like type and columnar forms are often seen. This juniper is even more variable than the Chinese one. The most showy form of the red cedar, in my opinion, is the one called var. glauca or var. argentea. It is of rather vigorous growth and its foliage assumes a fine glaucous or silvery grey at least in the spring and early summer. Later on it becomes more greenish. The finest plant I have seen of this variety stands in the famous arboretum of the late Mr. G. Allard, La Maulevrie, at Angers, France. Years ago when I saw it, it formed a broad, rather loose pyramidal tree of about 30ft. high.

The specimen shown I photographed in the interesting evergreen park of Count I. Ambrozy - Migazzi at Malonya, Czecho-Slovakia. It forms a vigorous plant and its

A FINE PYRAMIDAL FORM OF THE RED CEDAR WITH FOLIAGE OF A BLUEY-GREY COLOUR.

blue appearance was doubled by the numerous fruits which are covered with a blue glaucous bloom. Young plants of the red cedar are always of a much more dense pyramidal growth, and therefore much more attractive from a garden point of view.

AN EARLY FLOWERING COLCHICUM, C. BYZANTINUM, WORTH A PLACE IN THE ROCK GARDEN.

The finest low-growing variety of the red cedar is var. tripartita that forms irregular spreading bushes. It is sometimes rather similar to forms of the Chinese juniper, but the scale-like leaves of this species are obtuse and not sharp pointed, and the juvenile acicular leaves of the Chinese are often arranged in whorls of threes and not always in pairs as in J. virginana.—CAMILLO SCHNEIDER.

SOME SCUTELLARIAS.

AMONG the few species of the genus scutellaria that may be met with in our gardens, S. alpina from the European Alps is best known as a handsome hardy rock plant. It forms rather broad and dense cushions which are densely covered with large purplish flowers in terminal racemes. It is a very valuable summer-flowering perennial, its flowers lasting almost from the beginning of July until the first week of September. There is a white flowered variety and also one called var. rosea.

Another variety, var. lupulina, is often regarded as a species, and offered in the trade under the name of S. lupulina bicolor. It is sometimes described as having yellow flowers, but this is certainly a mistake. The flowers are of a rosy or violet colour, but the lower lip is much paler than the tube and the upper one. Hence the name bicolor. Both the type and var. lupulina grow scarcely higher than 6ins. S. baicalensis is a much more vigorous plant. It is a species from eastern Asia, and more commonly known as S. macrantha. It reaches a height of 8ins. to 12ins. or even more, and has fine blue flowers which are of great ornamental value during July and August in a large rock garden or in the herbaceous border.

Both species like rather dry, sunny places and do not need any special care. S. baicalensis is most easily grown from seed in April or May, while S. alpina may be best increased by division in autumn or perhaps better in spring.

Another old-world species, S. orientalis, or pulchella, from the Altai mountains, is occasionally found in the gardens. It is related to alpina, but its leaves are tomentose beneath, deeply dentate, and the flowers are purple with a yellow throat or wholly yellow.—C. S.

COLCHICUM BYZANTINUM.

DURING the second half of August, Colchicum byzantinum makes a very lovely display of soft rosy lilac flowers in my garden, at a time when the rock garden is rather bare of bright colours. As the picture shows, this kind is distinct, owing to the large number of flowers which rise out of each corm. I counted on several established plants from twelve to fifteen blooms. Its very early time of flowering and the abundance of blossoms distinguish it clearly from its close relatives, C. Bornmulleri and C. speciosum, to which a note was devoted in your issue of August 14th. C. byzantinum comes, not from Byzantium (*lucus a non lucendo!*), but from other districts of southern Europe, chiefly Greece and Asia Minor. I grow it in a rather heavy moist soil in slight shade. The leaves produced in spring have a vague resemblance to a veratrum.

From among *spring*-flowering colchicum species I should suggest trying the very elegant pink C. hydrophilum, from Cilicia, and C. montanum (*L.* not *All.*) from south Europe and Orient. C. crociflorum (*Regel*, not of other authors) from central Asia may also be a very delightful early spring-flowering species, but, so far, I have not been able to get the true plant.—F. LEMPERG.

DOG'S TOOTH VIOLETS LOOK WELL IN THE ROCKERY.

THE ALPINE SPIRÆA.

Lutkea pectinata. THIS little alpine spiræa will prove a delight in any rock garden. Small in every way, its lovely flowering spikes are only about 4ins. high, each individual flower having six white small petals with glistening yellow stamens, while its foliage clings to the ground and resembles a mossy saxifrage.

It loves a sunny, fairly dry position, and in such a corner its leaves will colour well in the autumn. We have raised it from seed and increased it by cuttings, and it seems of easy propagation.

Its native home is in the mountains in western Canada, where it covers quite large areas. It belongs to the rose family, and flowers in June and July.—R. MOORE, *Thorpe Hall, Essex.*

A BEAUTIFUL SUN ROSE.

IF ever I were doomed to grow but one sun rose, my choice would assuredly be Helianthemum lunulatum. For this little shrublet of the Mediterranean coast is not only one of the loveliest and daintiest of its race—which is saying much — but I know of none other which will flower so abundantly for so long a period.

Semi-deciduous in this country, H. lunulatum has no sooner refurbished its compact, bunchy cushion of slender, more or less procumbent, twigs with the gleaming silver of its tiny oval-pointed leaves, than it greets the spring with a galaxy of its pretty yellow blooms. This brave show is maintained until about midsummer, when the plant has a brief interlude of rest to break into renewed splendour in August, whence it carries on well into autumn. The blossoms, over ½in. across, are a particularly pleasing shade of yellow, and each petal has at its base a crescent of orange. It is not, perhaps, absolutely hardy everywhere. But it will stand a lot of frost if the root-run is gritty and stony. In addition to this, thorough drainage and full sun are desirable. It may be grown on the flat, but prefers to flop over a rock face. Plants from cuttings will begin flowering when no bigger than a golf ball.—A. T. J.

A PLANT FOR SHADY CORNERS

AMONG spring-flowering subjects there are few more charming plants than the erythroniums or dog's tooth violets. They are little known among the majority of amateur gardeners, and only one, E. Dens-canis, is seen to any great extent in gardens, and that one perhaps the least striking of them all. It is difficult to suggest a reason why they should be so seldom grown. They are of easy culture and only ask for a cool shady corner in the rock garden or under trees in a light, rather moist but well drained soil. The corms are best planted now at about 5ins. deep, and need not be disturbed again. It is an ideal plant for the man who gardens in his spare time, as once it is planted it can be left to its own devices and rarely fails to throw up its beautiful lily-like flowers year after year, generally in April. There are any number to choose from, with flowers of many delicate shades of white, cream, pink, bright yellow and rose, and the best for the amateur are EE. revolutum and Howelli, for a shady rock crevice; and, for a more open and sunny spot, E. americanum. This latter species is one of the choicest of woodland plants and should be given a trial under trees where the shade is not too dense.—T. C.

JAPANESE ANEMONES.

AMONG plants in our gardens that denote by the opening of their blossoms the near approach of autumn, few are more familiar than the Japanese anemones. A. japonica and its numerous varieties, by their profusion, bring a freshness to the garden with their flowers fromAugust and right on into September. The blossoms are thrown up on stout stems well above the dark cushion of leaves. Anemones are, as is known, simple to grow, and give a good account of themselves if planted in loam and leaf-mould with a little rotted manure added. They are popular as town and suburban plants and stand the confines of a town much better than most. Two of their worst enemies are the slug, which attacks the young shoots in spring, and the earwig, which spoils both leaves and blooms unless frustrated. Anemones thrive well in a sunny or partially shaded position. Propagation is effected by divsion of roots in late autumn or spring, or from root cuttings struck in the warmth of a propagator in spring.

It is a matter for surprise that so many appear content to grow one or two of the old sorts like the rose-coloured japonica and its white form, and apparently overlook the fact that there are others in this most interesting family worthy of a place in the garden. Mention should be made that anemones do not like disturbance, and in choosing the site it should be one where they can be allowed to remain. They are capital for grouping in a border with other hardy flowering plants, and, if mulched occasionally with manure, will call for little trouble. In a dry season, however, they need copious supplies of water as they are among the first to feel ill effects of drought. In a mild season it is no unusual thing to be able to gather blossoms to the end of October, and if planted on a wall border where some temporary screen can be given one may catch some of these late flowers.

JAPANESE ANEMONES THRIVE IN SUN AND SHADE.

Digitized by Google

Intending planters should, as far as possible, include some of the after-mentioned varieties to give colour to the garden in autumn: Prince Henry, double rich pink; Lady Ardilaun, large pure white with broad petals; Elegantissima, semi-double, silvery rose flowers; Max Vogel, fine double pink; Whirlwind, pure white semi-double; Alice, lilac and carmine pink; Queen Charlotte, very strong growing, tall, bearing sheaves of deep pink, crimped blooms.—W. LINDERS LEA.

GARDENING WITHOUT SOIL.

NOT everybody realises that it is possible to grow quite a lot of things in the room garden without the use of any soil at all. Gardening without soil, naturally, has limitations, but it is surprising what can be done in this way. Here are a few ideas which the writer carried out with great success, although at no time was any soil, or even fibre, employed.

For instance, ivy cuttings with well ripened stems will grow for years in plain water. If the shoots are allowed to rest in bowls or jars of water, roots will be freely sent out. The upper part of the stem then starts active growth and quantities of fresh, green foliage are produced. A pretty screen for an empty fireplace may be secured by training the ivy stems over a light wooden frame. Change the water in the jars every ten days unless a lump of charcoal has been placed in each. Then the water will keep fresh indefinitely.

Very quaint little moss trees are easily made. Go out into the woods and collect some of those rounded cushions of the fork moss (leucobryum), which are usually so common. Now secure some forked twigs, selecting those that resemble miniature trees in shape. The lower part of the twig forms the trunk of the tiny tree and the forked parts the branches. Over each branch press three or four of the moss cushions, arranging so that the larger ones are towards the lower part and finishing with a small, rounded cushion at the top. The trunk of the small tree is inserted into a hole bored in a block of wood. all one has to do is to keep the moss cushions damp and these will remain fresh and green for a long while. A few of these moss trees form a most charming and attractive table decoration.

Many seedling plants can be grown on a damp sponge. Of course, the bright greenery of grass is attractive especially in the winter. A sponge thickly sown with grass seed and suspended by means of narrow red ribbon makes a very ornamental object for the garden without soil. Some of the common annuals, like flax, Virginian stock, etc., can even be induced to flower on a damp sponge or a piece of moist flannel. To get this effect keep the little seedlings covered with a glass shade of some kind. Of course the flowers will not be quite so fine as those developed in the ordinary way, but it is something of an achievement to grow a plant from seed to a flowering state without the use of any soil at all. A little soilless rock garden is a novelty that is worth carrying out. Get a shallow dish and in the bottom of this place a piece of felt or flannel folded several times. Soak well with water and pile up the tiny rocks or stones to form the rockery. In the rock crevices push tiny fragments of moss and insert little pieces of stonecrop, house leeks or similar succulents. As well sow pinches of seed of various kinds in the crannies. All one has to do is to keep the felt or flannel damp and by capillary attraction the moisture is continually passing up among the rocks forming the little garden.—LEONARD BASTIN.

LOGANS AND HYBRID BERRIES.

IT is an undoubted fact that logan and similar hybrid berries are fast coming into popularity, and rightly so, for most kinds bear immense crops of fruit of the very finest kind.

The loganberry is, up to the present, the most popular of these hybrids. Bushes bear very large crops of long, juicy, but acid, fruits; such fruits make excellent and beautifully coloured jelly, while they also prove popular in other fruit concoctions. The Phenomenal Berry is, with us, almost exactly like the logan; the fruits may be a trifle smaller, but otherwise they prove exactly the same. The total crop is equally as large as that from the former, and the fruits equally as useful. The lowberry is a black loganberry; the fruits are of great size, jet black in colour, and they possess, when fully ripe, the choice flavour of the bramble. A fault is its extreme vigour, as the shoots are frequently 10ft. and 12ft. long. Although the general appearance of the Laxtonberry bushes is that of the loganberry, and the treatment given exactly the same yet the fruits are much different: they are globular, a brighter red, juicy and sweeter than the others. It fruits all summer and bears enormous crops, but the fruits are inclined to break up when pulled; the flowers are "self-sterile," and the plants must be near raspberries, loganberries or brambles, in order to get satisfactory cropping.

The Hailshamberry is also distinct and can best be described as an autumn-fruiting raspberry of luxuriant growth. The fruits are raspberry-like in every way, and borne in bunches at the tips of the young canes. The King's Acre Berry, one of our latest introductions, is a bramble-raspberry hybrid and, like the lowberry, it favours the former in appearance and flavour. In other ways it resembles the logan, *i.e.* in growth and habit; it fruits at the same time, the fruits being black and sweet, with the pronounced bramble flavour. The Wineberry may not be a hybrid but a natural species; it carries large crops of small, round, orange-tinted berries; the flavour is rather poor and, on the whole, the plant is scarcely worth a place. It is ornamental and the fruits ripen at the end of August.

One cannot overlook the brambles or blackberries among the autumn berries, but, of course, they are not hybrids. The Himalayan Berry, said by some to be a hybrid bramble, is a fine variety; it is a vigorous grower, and the fruits ripen rather earlier than the brambles; the flavour of the fruits is fine when they are fully ripe, and they are best used in jams and jellies. Old canes are not cut away in this hybrid, except when thoroughly exhausted.

All these autumn fruits are worthy of their place in a fruit garden, with the exception mentioned above. They are easy to grow; indeed, they all grow luxuriantly, and it needs a brave grower to tackle them at pruning time. In the small garden they do best on arches, pergolas or poles, or they may be allowed to ramble over a hedge or shed. In a fruit garden the best results may be had when they get ample space, a sunny site and good free soil, inclined to the heavy side. Pruning is carried out when the fruits have been harvested, the old canes being cut away at soil level and the new canes tied into position.—CLYDESDALE.

NURSERIES OF THE BRITISH ISLES.—IV

MESSRS. BAKERS' NURSERIES AT CODSALL

IF one was given the choice of a site for establishing a garden and the growing of all manner of plants, there are few who would be likely to alight on Wolverhampton as an ideal gardening spot. Yet such are the anomalies in gardening, that one finds in Codsall, only five miles out of the town and close to the Shropshire border, the flourishing nursery of Messrs. Bakers. The extent of the nursery at present is some ninety acres and the position, which is a rather exposed one, and the soil, which could not be called hospitable, must, we should imagine, prove that the growing of plants can be a rather difficult proposition at times. From the amateur gardener's point of view, however, the situation is a good one in that the plants which leave this establishment should prove hardy in almost any part of these islands. The plants, if they thrive under difficult climatic conditions not entirely conducive to good gardening, will certainly go forward by leaps and bounds when accommodated in a garden where good soil and shelter are provided.

Notwithstanding all these difficulties, however, Messrs. Bakers have built up a most successful business, which shows every promise of extending in the near future. All kinds of plants are grown, but the principal stocks are those of hardy border plants and alpines, and roses, shrubs and trees. Among hardy border plants, chief attention is being paid to the delphinium, astilbe and lupin, with one or two subsidiary subjects, and no doubt, as extension takes place, other kinds will be taken up and developed.

Everywhere there is evidence of their desire to please those whom they serve. They do not specialise in any particular line of work, but rather spread their interests over all branches of gardening wherein they can be of more use to the suburban gardener, a very important point in these days of ultra-specialisation. By their catholic tastes and their tolerant attitude to the amateur and his difficulties, they have done much to raise the standard of suburban gardening in this country and they deserve no little praise from those who desire to see our large industrial areas made the more beautiful by the presence of flowers, shrubs and trees. They have set themselves out to please the amateur gardener, whose ranks are swelling annually, and that they have already succeeded is beyond doubt, if one judges by the extent of their nursery and business. But there is still room for further expansion and improvement and we look forward to the future when still more Messrs. Bakers will become an integral part of the amateur gardener's life.

One of the most interesting parts of the nursery, at least to the ordinary amateur visitor, will be the well laid-out private garden of Mr. J. S. Baker, which is a pleasant and attractive retreat, open to all visitors to the nurseries. It is an innovation which many of our nurseries would do well to adopt, as the amateur grower obtains a much better idea of the characters of the respective plants, how they should be grown and the positions they should occupy in the garden proper. There are many features in this garden, such as the low retaining wall, which will prove to the amateur that each can be utilised and fitted in to his own garden scheme. The Codsall stone, rather attractive in appearance, a mixture of sandstone and limestone, lends itself to this treatment and gives considerable character to the wall. Moreover, the plants seem to take kindly to it and succeed well in

Digitized by Google

its crevices. All over the nursery, and in this private garden in particular, the herbaceous plants do extremely well, and the beginner will learn something more of the value of selecting plants for certain positions and of proper grouping for colour harmony and height. Many groups of delphinium varieties stand out prominently and the tall elegant spikes of such as "Jean" and "David," presented pictures of pleasant tranquillity. Particular use is made of shrubby backgrounds to the herbaceous flowers—an important point in garden design, and the amateur grower will realise their enormous value in this respect alone. Here lies one of the lessons to be learned in this show garden. It demonstrates how the shrubs seen elsewhere in the nursery in their respective lines and rows are to be utilised in association with other plants in the garden. It was here, also, that we noticed a very fine specimen of Cotoneaster salicifolia which had attained some 12ft. in height, although only planted as a dwarf bush some three years ago. It is a shrub, judging from its capabilities as seen in this garden, which is eminently suited as a screen plant, almost guaranteed under reasonable treatment to form an effective screen hedge in about two to three years time. In addition, it has considerable beauty of flower, which renders it doubly attractive. In summer, the blaze of colour is most effective, but in spring the garden is not without charm, with its complement of early-flowering cherries and late-flowering pears. In autumn, too, the display is maintained by the use of chrysanthemums and asters, both of which Messrs. Bakers specialise in to some extent. There is little doubt that as well as being an effective and interesting flower garden, it stands as a prominent educational feature of the nurseries and a monument to the enterprise of the firm. Every amateur should certainly make a point of seeing it when on a visit to the nurseries.

In the nursery grounds, everything is on an extensive scale. The alpine department, almost as large as the hardy border department, is entirely self-contained and possesses its own propagating houses and frames, all arranged in an orderly method. One sees in this department something equivalent to mass production in the raising and growing of alpine plants. The visitor will also notice that the modern concrete frame has replaced the old wooden type with the most successful results, to judge from the growth and general health of the plants.

The shrub department, recently greatly extended, is also on a large scale and offers a wide selection in all kinds of shrubs, all of which are either raised from seed or grown from cuttings on the premises. In that way, good sturdy plants are the outcome and purchasers can be certain of being supplied with real home-grown material—a great asset in these days when so many of our plants are imported. Fruit trees are also plentiful and all looked to be in a healthy condition. Spraying is carried out at regular intervals to insure against disease.

HERBACEOUS FLOWERS DO WELL AT CODSALL. GATHERING FOR THE MARKET.

CORNER OF THE SHRUB GARDEN AT MESSRS. BAKERS'.

Among the many hardy plants delphiniums and lupins were present in the greatest numbers. One break of some eighty thousand delphiniums looked most effective; while, from the point of view of colour, the bed of the new Lupin Delight, of a brilliant carmine shade, stood out from its neighbours.

Another excellent border subject of which we saw a large stock was the astilbe, unfortunately not in flower. The size of the individual plants and their elegant habit were most remarkable. There were other subjects, all showing patches of rich colour here and there over the nursery, but space does not permit of a detailed list.

One more point in connection with Messrs. Bakers to which we would draw attention is that branch of the business devoted to garden design and construction, which we believe has been increasing enormously of late years. The nursery has much to offer in the way of interest and education in horticulture and no amateur will regret a visit to Codsall, where he will learn something of the commercial side of growing plants and in addition will pick up much information which he will find of great service in his own garden.

THE ALPINE PROPAGATING HOUSE.

CORRESPONDENCE

THE CHEROKEE ROSE.

SIR,—I do not think the Cherokee Rose requires any special aspect, as long as it has a wall at its back. I had it for over fifteen years on a west wall. I now am growing it on an east as well as on a south-west wall. It is certainly worth growing.—D. B., *Uckfield, Sussex.*

WINTER ACONITES.

SIR,—Mr. W. Linders Lea in THE GARDEN (September 4th, 1926), expresses some surprise that that charming little bulb, Eranthis hyemalis, is not more frequently grown. Possibly, however, the reason for this is that in some gardens it is a complete failure. It is in mine. For many years I bought every autumn a hundred or more bulbs—probably between 1,000 and 2,000 altogether—but the result was always the same, to wit, about 90 per cent. flowered the first season after planting; 20 per cent. the second and from 1 to 10 per cent. in ensuing seasons. I have now ceased to buy and every year I get a great display of pretty green leaves, but rarely more than half a dozen flowers. If anyone can tell me why this should be so, I shall be greatly obliged. The bulbs have been obtained from three different firms, all first-class, and planted in full sun and also under deciduous trees, but with equally unsatisfactory results. My soil is very light, dry and full of lime. Does this account for my failure, which annoys me very much?

May I say that winter aconites are delightful as cut flowers, if arranged in shallow bowls lightly filled with tufts of mossy saxifrage? A few little red-veined ivy leaves may be added with advantage.—R. E. H., *Bath.*

NAMES OF EARLY POTATOES.

SIR,—In reply to Mr. Geo. Stuart, *re* "Early Potato Names," in THE GARDEN of August 14th, page 462, he now contends that Victory is merely a re-baptised Duke of York; he also says that a raiser must be protected.

As the late Mr. Sim of Fyvie was the raiser of both these potatoes, I really cannot see what bearing protection would have in this particular instance, or how applied. To say that the raiser re-baptised Duke of York and put it out as a new potato under the name of Victory, casts a reflection on the reputation of a renowned potato raiser. As indicated in an earlier issue, Victory was the result of a cross between Duke of York and Fyvie Flower. The raiser gave it to growers in the firm and sincere belief that he had given growers an improved Duke. The really good types of these potatoes found here and there throughout the country, and being re-baptised as Duke, are no doubt remnants of the original seeds of Victory that have been preserved. The climatic conditions and soil of Deeside, and part of Aberdeen and Kincardineshire, appear to suit the healthy development of the Duke of York type to a remarkable degree. We may say that we are clear from all virus, mosaic and wart disease, which these potatoes appear to be heir to. Our potatoes, in consequence, are usually all fine healthy, clean, well developed specimens, and we are easily able to detect a deteriorated stem. It also enables us to speak with confidence on the matter.

It was not to sustain a dogmatic argument that I took up the defence of Victory, nor am I going entirely on my own experience; I have the support of other growers of long experience, and of exhibitors of potatoes.

I note that I made an error in stating "a quarter of an acre" as the scheduled area; it was a clerical one, however, as everyone interested in potatoes knows the scheduled regulations.

Compulsory lifting of potatoes in the middle of August undoubtedly imposes a hardship on many at that season of the year when other important work has to be done. The latter consideration deters many from the planting of early non-immunes.

Mr. Stuart says that there are as good immune early potatoes as non-immune. He is unquestionably right. The Di Vernon he mentions is a splendid potato, of excellent quality, and an exceptionally heavy cropper. Unfortunately, we find it to be ten to fourteen days later than Duke or Victory. Witch-hill, decidedly the best table potato of them all, is but a second early. I note that Mr. Stuart lifted his Di Vernons on June 23rd; here we lifted Victory on June 10th—large tubers.

I believe if the Board of Agriculture devoted a good deal of their money to further the raising of early immune varieties, and the giving of prizes of some value to that end, it would be a real benefit to practical agriculturists. These only to be awarded in the case of the production of an immune potato of equal earliness to that of Duke or Victory. If this could be accomplished, the Board could make it compulsory to scrap and destroy all non-immunes completely, immaterial of what area they were grown upon. It would ultimately save a vast annual expenditure upon our endless string of regulations, printing, postage, etc., and would be the only real solution to this problem.—W. GRANT, *Crathes, Kincardineshire.*

VEGETABLES AT WESTMINSTER

THE Royal Horticultural Society's Amateur Vegetable Show, held in conjunction with the general fortnightly meeting on September 7th, brought home two points. First, that, when properly displayed, vegetable exhibits can be quite as attractive as fruit or flowers; and secondly, that during the last few years the quality of vegetables grown in private gardens has improved considerably, in many cases being equal to that of the vegetables raised by the leading trade exhibitors in the country. In some instances the staging and method of arrangement were not all that could be desired, but it must be remembered that the amateur cannot be expected to come up to trade growers in this matter, for he has neither the same experience nor the same scope. This point was emphasised by the magnificent non-competitive vegetable group displayed by Messrs. Sutton and Sons, a group which was not restricted as to space, variety or quantity of material used. In this collection were countless vegetables of all kinds, admirably grown and staged. Brilliant orange capsicums, red and white blotched ornamental podded French beans, pure white egg plants, and the shiny brown skins of huge selected strains of Ailsa Craig onions made a most attractive contrast against tender green beans and peas.

The foremost amateur group was that shown by Viscount Hambledon, who won not only a first prize, but the Sutton Vegetable Cup also. The leeks, parsnips and onions in this collection were of excellent quality. Sir Charles Nall Cain, Bt., came second in this class, Sir Joseph Tichbourne third and Lord Riddell fourth. The latter had some remarkably good specimens of onions and tomatoes. For a smaller vegetable collection Mr. R. Chetwynd-Stapylton was awarded the first place. Particularly good were his leeks (variety Acquisition). Mr. R. H. Ling took the first prize for a collection of six distinct kinds of vegetables, and in a similar class Mr. J. Day had the best group. In all these vegetable groups it was somewhat surprising to see that, in many cases, the same varieties had been selected. Tomato Best of All, Onion Ailsa Craig, Potatoes Catriona and The Bishop, Cauliflower All the Year Round, were general favourites and, indeed, excellent exhibition varieties.

The onions exhibited were of good size and shape and of fine finish. Improved Reading, Silver Globe and Crimson Globe were some of Viscount Hambledon's prize varieties. Celery Solid White and the cabbage lettuce Ideal, shown by Viscount Hambledon among a collection of salad vegetables, were of splendid size and quality.

Numerous classes were devoted to single dishes of separate vegetables. Major C. B. Krabbe, Sir Charles Nall Cain and Mr. J. H. Hill showed prize beans; and the following were awarded first prizes: Mr. J. Head, for globe beet; Sir Joseph Tichbourne, Bt., for long beet and onions; Mr. S. Thompson, for Brussels sprouts; Viscount Hambledon, for cabbages, cucumbers and onions; the Hon. Sir Ronald Lindsay, for celery; Cheadle Royal Mental Hospital, for celery, peas, turnips (white and yellow fleshed); Mr. R. Chetwynd-Stapylton, for cucumbers; Mr. J. Fleming, for leeks; Mr. J. Wells, for marrows; Mr. R. B. Hoare, for mushrooms; Sir Randolf Baker, for parsnips and carrots; Mr. R. Abel-Smith for onions; Mr. W. H. Tyzack, for carrots; Mr. G. Thorn, for potatoes; and Mr. R. H. Ling, for tomatoes.

As well as vegetables exhibited by amateurs, there were non-competitive groups of flowers and fruit put up by the trade. Mr. T. Rivers had an excellent group of well grown pot fruit. His specimens of the Plum President were bearing heavy crops of large fruit. The peach (variety Sea Eagle) was well laden. A collection of plums in dishes and pot-grown espalier and bush-trained fruit trees was displayed by Messrs. J. C. Allgrove. Several interesting new apple varieties, such as Bedford Pippin, Laxton's Harvester and Beauty of Bedford were exhibited by Messrs. Laxton.

Great strides are being made in the evolution of the montbretia. Large blooms of brilliant and varied colouring are borne on strong wiry stems by these modern varieties. Some of the finest, such as His Majesty, Queen Charlotte, Copper King and Sunshine were shown by Messrs. Barr and Sons. Unfortunately, Messrs. Dobbie's fine strain of China asters, which otherwise would have made a most attractive group, showed marked signs of damage by the recent violent gales and heavy rains. Late Beauty Carmine Rose was a delightful colour; Early Beauty Crimson and Late Beauty Purple were also good. A collection of late-flowering herbaceous phlox came from the nursery of Mr. H. J. Jones.

Gladioli were exhibited by a number of firms. Mr. Alfred Edwards and Messrs. Kelway and Co. had the finest collections. Among Mr. Edwards' well staged group a number of beautiful varieties were noted. Topsy, Xanthia and Ethel, among the primulinus section; while Orby and Caruso, belonging to the large-flowered type, were perhaps the most attractive. Messrs. Lowe and Gibson and The Orpington Nurseries also showed gladioli. All gladioli growers have suffered heavy losses through the recent bad weather, and not one exhibitor was able to show a representative collection.

A particularly good strain of giant-flowered streptocarpus of varying shades was shown by Messrs. Cuthbert. Tritoma erecta and perennial scabious were shown by Mr. Isaac House; Cupressus Lawsoniana Lanei

Digitized by Google

by Mr. H. Lane; and Solidago Hemsley's Dwarf by Mr. H. Hemsley. This solidago should prove a most useful acquisition for the herbaceous border. It grows about 3½ft. tall, is erect in habit, floriferous, and has attractive dark foliage.

ORCHIDS.

BRASSO-LÆLIO-CATTLEYA IRMA (B.-L.-C. The Baroness × L.-C. Golden Queen).—A beautiful flower both in formation and colour. The sepals old gold, the petals yellow with a delicate apricot tinge, the open labellum best described as orange-flame, margined with cerise-purple. From Baron Bruno Schröder. First-class certificate.

ODONTONIA REGINA (Odontonia Gladys × Odontoglossum Doreen).—A charming hybrid which takes the form of a large odontoglossum. The sepals and petals heavily blotched with crimson-purple, the labellum profusely marked with small rose-purple spots. From Messrs. Charlesworth and Co. Award of merit.

LÆLIO-CATTLEYA CANTAB VAR. SUNSET (C. Ballantineana × L.-C. St. Gothard).—A very showy hybrid with a spike of three large flowers. In colour rich purplish mauve, the labellum ruby-crimson with golden venation in the throat area. From Messrs. Stuart Low and Co. Award of merit.

THE AUTUMN ROSE SHOW

THE jubilee year of the National Rose Society has been one of the most outstanding and successful years in the history of the Society. During this season numerous shows have been held throughout the country, and at each one competition among the exhibitors has been keen, and countless rose lovers have flocked to see the beautiful displays of our national flower. Interest at these shows has centred mainly round two classes of roses—those that are of value for garden decoration and those whose chief merit lies in their delightful fragrance. It could be clearly seen at this autumn show that the raisers of new seedling roses had considered these points well, and although the number of awards given to new roses was small, there were several new varieties exhibited which should prove good all-round garden roses.

THE NURSERYMEN'S CLASSES.

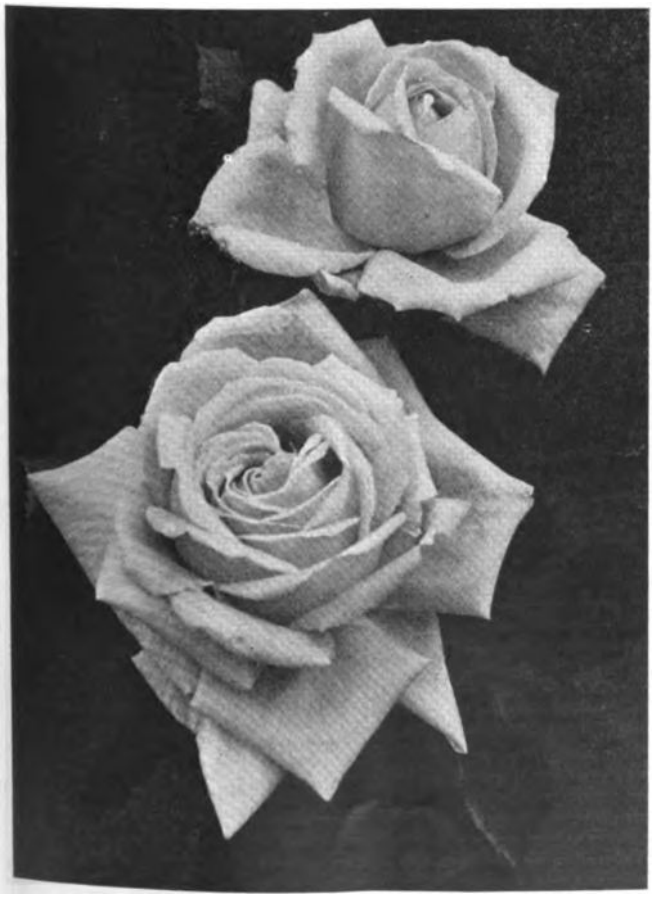
As is usual at the shows of the National Rose Society, the large trade group presented a magnificent spectacle.

Within the limits of space allowed, the exhibitors in the class for the large representative group of cut roses were particularly successful. Of the nine collections, there could be no doubt but that the very best was arranged by Messrs. S. McGredy and Son. This was noteworthy for the splendid quality of the very many blooms as well as for the excellence of the arrangement. They were particularly happy in the finish, and the trails of Phyllis Bide and small vases of Lady Inchiquin, Lady Roundway and other sorts leading up to the larger quantities, had a very telling effect. Their pillars of Mrs. Henry Morse, Margaret McGredy (of glowing colour), Betty Uprichard and Mabel Morse, and the baskets of the deep pink Mrs. H. Barraclough, White Ensign, Diadem and Padre, were most handsome. This memorable exhibit received the silver-gilt medal and first prize.

In the second prize group of Messrs. Alex. Dickson and Sons, there were very charming baskets of Mrs. Wemyss Quinn, Betty Uprichard, Shot Silk and Lady Inchiquin, with generous pillars of Madame Edouard Herriot and Margaret Dickson Hamill. The third prize was awarded to Mr. C. Gregory.

Competition was not so keen in the class for a smaller, though still larger group, of roses, and here the first prize was won by Messrs. R. Harkness and Co., who had a very fascinating series of arches of Betty Uprichard and Mrs. Henry Morse at the back. In the centre and towards the front they placed delightfully arranged baskets of Los Angeles, Lord Charlemont, Hadley, K. of K. and Isobel. Mr. John Mattock, who was second, had a pleasant arrangement of pillars of Isobel, Vesuvius, Red Letter Day and Betty Uprichard. Mr. G. Lilley was third.

The three exhibits of twenty-four varieties of roses in separate vases provided an excellent opportunity for examining the habit as well as the beauty of the flowers, and all those shown were of good garden value. Mr. John Mattock had, in his first prize collection, splendid vases of Mrs. Henry Morse, Hadley, Innocence, Betty Uprichard and Los Angeles, Mr. Henry Street was second, and he included Mabel Morse, Christine, Innocence and Emma Wright. Messrs. A. Warner and Son, the third prize winners, used Mrs. McKellar, of cool lemon yellow colour; Lady Pirrie, Mrs. Henry Morse and other good sorts.



DAME EDITH HELEN, THE BEST SCENTED ROSE OF THE YEAR.

ROSE PATIENCE, ONE OF MESSRS. MCGREDY'S NEW VARIETIES.

Digitized by Google

The method of exhibiting roses in round baskets is also very useful to the visitor as this entails the cutting of the blooms with long stems, and so one may appraise their vigour and freedom in flowering. Messrs. Wheatcroft Brothers were certainly first with four baskets of decorative varieties, for they showed Mme. Butterfly, Mrs. H. Stevens, the Queen Alexandra Rose and Shot Silk splendidly. Messrs. T. Smith and Sons had good baskets of Mme. Edouard Herriot, Ophelia and British Queen in their second-prize exhibit. Messrs. D. Prior and Son won the first prize for three baskets of Polyantha roses even more easily, for the second prize was not awarded. They showed lovely baskets of Else Poulsen, Kirsten Poulsen and Orange King. The exhibition roses in baskets were not of such good quality as the other types. Messrs. T. Smith and Son were first with two baskets of fairly good blooms of Earl Haig and Mrs. John Laing; while Mr. G. Burch was second with George Dickson and Frau Karl Druschki.

Many of the exhibition roses exhibited on boards also showed signs of the recent inclement weather. There were only two collections of twenty-four distinct varieties, and the best, shown by Messrs. T. Smith and Sons, included good blooms of George Dickson, Mrs. C. Lamplough, Frau Karl Druschki, Augustus Hartmann and Souvenir de Georges Pernet. Messrs. Prior and Sons' second prize collection included some weather-stained blooms, but their Snow Queen, M. Louis Crette, Coronation and Florence Forrester were good.

The eighteen varieties were rather better in the first prize exhibit of Mr. George Prince, who had clean and bright specimens of Caroline Testout, H. V. Machin, Frau Karl Druschki, Earl Haig and George Dickson.

Amateur Section.

The roses shown by amateurs varied considerably. Some were badly damaged by rain, others again were of fine quality. Many beautiful roses in vases were exhibited, and in the classes for exhibition roses competition was keen and the blooms were good. In one of the classes for amateurs who grow their roses without any assistance, Miss B. H. Langton won a first for vases of six different varieties, her best being Los Angeles and Mme. Edouard Herriot. General McArthur and Betty Uprichard were among the second prize group of Mrs. H. Cribb. In a similar class Mr. W. E. Moore had prize vases of Shot Silk and Hadley. The vase of roses shown by Mr. A. C. Turner was far superior to any of the others in the same class.

Among the exhibition roses George Dickson proved to be a great favourite. Mrs. Henry Bowles was also used by the majority of the exhibitors, and perhaps the best specimen was seen among the collection of twelve prize blooms shown by Mr. H. Mitchell. In this class Mr. J. N. Hart had excellent blooms of Frau Karl Druschki, and Mr. Gulliver Speight was awarded a prize for a collection of exhibition roses.

The roses shown in baskets varied also, both in the condition of the blooms and in the arrangement. Mrs. H. Cribb, Mr. S. E. Tattershall and Mr. H. Mitchell had good first prize baskets.

As a whole, there was a great similarity between the table decorations, and little originality was shown in arrangement. Mme. Butterfly or Roselandia were used by the majority. In the ladies' section, first and second prizes were won by Mrs. Courtney Page and Mrs. F. Charlton for tables decorated with Roselandia and Mme. Butterfly respectively. In each case the blooms were perfect. A particularly artistic table was arranged by Mrs. Colston Hales. Two large bowls filled with Isobel and Betty Uprichard were set diagonally across the table, and one small vase was placed at each corner. In the open artistic section, both Mrs. L. R. May and Mrs. Tisdall used Mme. Butterfly for table decoration. Mrs. L. R. May's blooms were fresh and spotless and her table gained the premier award. The second prize went to a pretty decoration by Miss M. G. Archer. Dainty Bess, the shell pink single, had been used for this table.

Mrs. Courtney Page again won a first prize for a vase of Mme. Butterfly. There are few who are able to arrange roses so skilfully as Mrs. Courtney Page. Her bowl of mixed roses also took a first prize. The bowl was lightly arranged with roses of all colours and attractive rose foliage. Mrs. Oakley Fisher came second for a bowl of roses. The bowls in this class were all good. In the open artistic classes, the first prize went to Mrs. A. R. Bide for a bowl of Phyllis Bide and Angele Pernet, an attractive combination.

New Roses and Special Awards.

Patience was awarded a gold medal. This is a salmon pink hybrid tea shaded with orange. The buds are pointed and the foliage good. It is a perpetual flowering rose, slightly fragrant, with a free and bushy habit, and will be excellent for either garden decoration or for bedding. Shown by Messrs. S. McGredy.

Dame Edith Helen received the Clay Cup for the best scented rose raised during the year. It is a vigorous growing hybrid tea, with large shapely blooms of bright carmine pink. It is very sweetly fragrant and is said to keep its colour remarkably well. Shown by Messrs. Alex Dickson.

J. Ferris received a certificate of merit. This hybrid tea variety has large creamy white blooms borne on strong stems. It is free and upright in habit and perpetual flowering. As an exhibition rose this variety should be of value. Shown by Dr. Campbell Hall.

Charles P. Kilham, also, was awarded a certificate of merit. This is a bright pink hybrid tea which is shaded and blended with orange. The colour is uncommon. In shape, the blooms are long and pointed and are borne on particularly stiff, strong stems. The foliage is shiny and very dark, and appears to be mildew resistant. Shown by Messrs. G. Beckwith.

Thelma won the Cory Cup for the best new rambling rose. It was shown at the Spring Rose Show, when it won a certificate of merit. It is a vigorous and fairly free flowerer. The blooms are a pale pink. Raised by Messrs. Walter Easlea and Sons.

George Dickson.—This well known old variety was awarded a silver gilt medal for one of the best roses exhibited in the nurserymen's classes. Shown by Messrs. T. Smith.

THE DAHLIA SHOW

THE organisers of a dahlia show need be thorough-going optimists, for, as is well known, the dahlia is the most tender of the flowering plants grown to any extent in our gardens, and the slightest of frosts, which leaves other plants none the worse for its visitation, will destroy effectually the hopes of a good show of dahlias. For some years the weather has been kind to the National Dahlia Society, in that there has been no early frost until after the annual show. This good fortune continues, and on September 8th last the Society had an admirable show of the newest and best, as well as of many old favourite, dahlias at the Royal Horticultural Hall, Westminster.

The large trade groups, aranged in the conventional manner around the hall, made a splendid frame for the competitive classes. These generous displays of bloom attracted the well merited attention of many of the visitors and, as there was a pleasant variety in the styles of arrangement as well as in the types and sorts so admirably arranged, the groups escaped the monotony which at times afflicts such exhibits.

The most effective of the many collections was that of Mr. H. J. Jones, who, with great artistry, associated his dahlias with exceptionally good secondary spikes of delphiniums and brilliant kniphofias. Mr. Jones arranged his flowers in many medium-sized gilt baskets, every one of which was a picture in itself, while part of a harmonious whole, well worthy of the gold medal.

From the pure dahlia point of view, the palm was given to Messrs. Dobbie and Co. for a superb collection of dahlias. This was of varieties chiefly of the decorative collarette type, all raised by them, and the colour associations were delightful; the flowers themselves were, of course, excellent examples of cultural skill. The judges awarded this imposing exhibit a large gold medal.

Gold medals were awarded to Mr. J. B. Riding, Mr. J. T. West and Messrs. J. Cheal and Sons for their admirable collections of dahlias. The first-named specialised in the large decorative types; while Mr. West gave special prominence to the useful small peony-flowered varieties, of which he has raised so many; and Messrs. Cheal and Sons set out in front of their exhibit many baskets of dwarf single varieties of the type now termed "mignon" dahlias, which are on trial at Wisley this year.

In a corner space Messrs. Jarman and Co. set up a most artistic display, largely of excellent cactus varieties, well worthy of the silver-gilt medal, an award which was also made to Mr. J. Emberson for equally good cactus and other varieties; and to Messrs. Carter Page and Co. for an extensive collection of most of the types best suited for garden display. Messrs. Waterer, Sons and Crisp and Mr. H. Hemsley also had interesting collections of dahlias.

Most of the competitive classes were well filled with very good blooms. The outstanding features were the exhibition cactus and the dainty pompon varieties. Messrs. J. Stredwick and Son, in the open classes, and Mr. A. Brown of Leagrave, and Mr. A. T. Barnes of Bedford, in the amateurs' classes, were the chief prize-winners. Their best varieties were Herbert Blackman, Supreme, Mammoth, Mrs. W. Jackson, Mrs. A. Harvey, Edgar Jackson, Edith Page and S. J. Jones. Again the tiniest and most perfect pompon dahlias were to be found in the amateurs' classes, and the blooms, smaller than many a button, of Nerissa, Little Beeswing, Bacchus and other sorts were very charming.

The class for garden cactus dahlias was not well contested, and the blooms that were exhibited did not impress one as being of great garden value; they were mostly weak in the stem, but the miniature peonies were especially decorative. Messrs. Wilham Treseder, Limited, in the open class, had beautiful little blooms of Cherry, Miss M. A. Hay, Our Annie and other sorts.

The Floral Division was a fascinating feature of the Show and contained many well arranged exhibits in bowls, vases and baskets, as well as on dinner-tables; while the sideboard decoration of Mr. J. Emberson was decidedly the best of the many exhibited. Miss E. L. Jones was first in the dinner-table class for star dahlias; and Mr. Courtney Page excelled with other types. A large number of novelties were selected for trial at Wisley, but some of them were scarcely worth the distinction, and it remains to be seen how they do in future.

WARNING!

SPECIAL STATEMENT BY RYDERS, ST. ALBANS

We strongly advise all Bulb growers to apply at once for Ryders 1926 Bulb Catalogue, now ready, for distribution and on no account to place their order for bulbs until they have had an opportunity of comparing Ryders Prices with those of other leading British Bulb Merchants.

Owing to large purchases Ryders have once again secured the pick of the new season Bulbs and are able to offer first grade bulbs at extremely favourable prices, in addition to Special Collections at Special Prices which are a practical and money saving feature of the new Bulb Catalogue.

We warn our Customers to ignore the many tempting Bulb Offers now being posted from abroad. Many such bulbs are of inferior quality and are likely to cause intense disappointment when flowering time arrives.

Make sure that your bulbs are reliable and true to strain. Buy Ryders Beautiful Bulbs at Popular Prices.

Small Orchards

No matter how small or large the orchard, it pays to use Stictite Tree Banding Compound.

Winter Moth rises from the soil early in October or late September, and the females (being wingless), at once crawl up the tree trunks in order to deposit their eggs in the branches.

By banding the trees with Stictite in the autumn you can prevent the eggs being laid, and so avoid having to spray for the caterpillars in the spring,

1 lb. of Stictite will do 9 to 12 trees of about 8 in. diameter.

½-lb. 1/6 (post 6d.); 1-lb. 2/9 (post 6d.); 2-lb. 5/- (post 9d.); 4-lb. 10/- (post 9d.); 7-lb. 17/6 (post 1/-).

Greaseproof Paper, 5 ins. wide: 6 yds., 2d.; 12 yds., 3d.; 25 yds., 6d.; 50 yds., 9d.; 100 yds., 1/6; 200 yds., 2/6.

GARDEN TECHNIQUE

FLOWER GARDEN.

HARDY FLOWERING PLANTS IN AUTUMN—TAKING STOCK.

ONE of the duties which presents itself to the grower of hardy flowering plants at stated periods is the taking stock and making arrangements for division of those which need it. Neglected in this particular, plants soon get out of hand and confusion ensues. No time is better to review the work than autumn, before the foliage entirely dies away: for, in the absence of a label, one is not quite certain of their whereabouts and sometimes unintentionally disturbs plants that are better left alone.

No rule is applicable to all and every clump in a hardy flower border, as constitutions differ so much, and division which would benefit one would be prejudicial to another. Take for example robust growing plants like starworts and chrysanthemums of the maxima type and compare them with, say, gypsophilas and alstrœmerias. The first two can seldom be allowed to remain in one place more than a couple of seasons without being taken up and divided. The last-named, although strong growers and deep delvers, their roots penetrating a considerable distance, are best left alone when established and doing well, and if one attempts to lift them, roots in most cases being brittle, snap off, and they seldom recover for a long time. Before making a start on the work, the better plan is to be quite sure that division is necessary—and that autumn is the best time. As a general rule most lilies should be shifted at the fall of the leaf, and irises of the flag section as soon after the flowering season is over as convenient.

October, however, will be found as good a time as any for most things, as by then many are showing signs of having spent themselves and one can get on with the work before frosts likely to injure, appear. In the case of long borders of hardy plants, it will be found more satisfactory to deal with them in sections, rather than uproot the whole of the plants at the same time, as, should a spell of frost occur to delay the work, the risk of injury is less than the whole of the clumps being left out of the soil.

Fresh Positions.—After a portion of the ground has been cleared, it is advisable to dig it well before any replanting is done, and work in any old manure that may be necessary. It is always advisable to plant hardy things in fresh positions instead of putting them back in the same spot. Care should be taken in dividing clumps not to injure them more than can be avoided. Autumn affords one an opportunity of re-organising hardy flower borders, and of making changes which suggest themselves during the summer when plants are in bloom. It is better done at this time of the year than in spring, as plants have time to get established, while, should a dry season follow spring planting, failures often ensue. If the work is undertaken in October one can often "pick the day" for it, and there is always a deal of satisfaction when it has been completed and borders made tidy, each clump being "tallied" to denote its occupant, a very important point to bear in mind, especially in regard to herbaceous perennials which may have been removed from one position to another.

As we have said, if hardy plants are left alone and neglected to be divided, nothing but confusion can possibly result. It is a duty frequently put off, to the detriment of the plants and the general appearance of a garden. One must have order, and this is only achieved by taking in hand at certain intervals work which, to some, is irksome, but carried out at the right time brings its own reward.—W. F.

VIOLETS IN FRAMES.

VIOLETS which are grown in frames in order to provide early flowers, must have bottom heat in order that growth may be continuous. This heat need not be and ought not to be excessive; a pile of stable litter is generally used or, probably better still, half litter and half fallen leaves, the ingredients being thoroughly teased out and mixed before being placed *in situ*. Rank horse manure should be stored for ten days before use and teased out two or three times. When a heap larger than the frame has been secured, it is then tramped firm—indeed, very firm; the frame is laid on top, 8ins. of good soil spread inside, after admixture with a little artificial manure or guano (say 2lb. per large frame), and the whole left for another ten days. By this time the heat will have risen and started to decline; lift or procure plants and at once plant them in the frame, 8ins. apart, the plants ought to be quite close to the sash when everything is correct. Water moderately well and keep the sash tight for a week, shading during the day. Afterwards admit air more and more until the sash can almost be dispensed with entirely on a fine day; always open on the lee side, however, and keep the frame shut in frost, fog or cold, dull weather. Protect from frost by means of mats and dust the soil with lime if rot or decay sets in. Never let the plants become too dry or red spiders will prove a nuisance and do not give too much water in dull, non-drying days; remove runners as they form and gather the flowers daily. Beginners may buy in plants at this time suitable for the above process.—H. A.

PLANT ALLWOODII PINKS NOW.

ALTHOUGH they have fallen from the front rank of popularity, Allwoodii pinks are still in the van of horticultural progress, excellent plants for those who love profuse and glorious blossom in summer. Experience during the last five years shows that best results are invariably obtained by planting in autumn. This rather upsets the usual plan of things; cuttings are taken early in the summer (or seed may be sown in early May), so that plants are available in August or September for the borders. By winter, such plants are firmly established; they are quite hardy, and may actually grow during what we generally regard as the dormant months. Naturally, such plants blossom much earlier and more freely next summer, this causing them to be considered perpetual-flowering. Readers who have cuttings which are just rooted, and no more, may with confidence plant out during a fine spell yet. Seedlings raised this year may also be put into permanent places. Rock garden lovers are reminded that Allwoodii are fine things in the rock garden.—CLYDESDALE.

POT UP ARUMS.

THE arums, callas or richardias, as the popular "lilies" are various called, need attention about this time. Whether planted out in the open border during summer or kept growing in pots or dried off, they must now be potted up in a loamy compost of a rich nature, say loam 3 parts, sifted dry manure 1 part, and sand ½ part. An 8in. pot will take three medium roots, but, of course, this is only an average guide and much depends on the root-stocks themselves. Water is sparingly given until growth starts in the frame, after which they must go into the greenhouse for safety. Well rooted by this time, they may then be forced into early blossom; but a good number should also be kept under fairly cool conditions, coming into bloom a little later in the New Year. When full growth starts they require water more freely and liquid feeding. This is also a fine time for beginners to buy in stock, bulb catalogues generally listing a few varieties at moderate prices. The most popular species, Æthiopica, is easiest to succeed with at first; Childsii is of more compact growth, producing a profusion of delightful white flowers. Where space is a consideration the popular variety Godfrey is to be recommended, this plant being of medium growth, one of the earliest to flower and a distinct clean white. Little Gem may prove a trifle shy unless well treated, but, being a dwarf, it is always popular for table decoration; it blooms with great freedom. Perle de Stuttgart, an older variety, is also very fine.—H. H.

KITCHEN GARDEN.

THE CLUB ROOT OF CABBAGES.

CLUB root or finger-and-toe is a common disease which only attacks cabbages, turnips, swedes, radishes and members of the cruciferous order. The cause of the trouble is a fungus or minute organism which lives in the soil; the part attacked is invariably the root, which is clubbed or malformed in the familiar way. Growth slows down after attack, development practically ceases and failure is the result. Club root—and this is a point which must be emphasised—is extremely infectious; nevertheless, it only spreads from infected plants or soil, and so a cure is, in a sense, fairly easy. When an attack develops, infested plants should invariably be burnt or deeply buried; care is thereafter taken that no soil is carried to another part of the garden and, at the very earliest opportunity, a heavy dressing of caustic lime is applied and dug in. At least 1lb. per square yard should be given, and quicklime is best; slake it in little heaps, let it stand till it crumbles down, scatter and dig in in a short time. Ground lime is very good; freshly slaked lime quite effective, but a half more is necessary; other limes are less useful, but all have an anti-club effect. It must never be overlooked, however, that the ordinary liming process is not a complete cure immediately, for the simple reason that an intimate mixture of the soil and the lime is impossible by ordinary cultivation. For several years, therefore, no cruciferous plants (cabbages, cauliflower, borecole, sprouts, wallflower, stocks, rape, radishes, such weeds as cress, shepherd's purse, and so on) should be allowed on that plot of ground; this makes the cure certain, and immunity is then secured. Also, growers who have to raise plants in fresh land or in land which they are not too certain about, should always apply in advance of cropping a small lime dressing as a precaution.—LANARKSHIRE.

DANDELION AS A SALAD.

THE blanched leaves of the common dandelion make an excellent salad for mixing with lettuces during the autumn and winter. At this time of the year go out and collect the dandelion plants from fields and hedgerows, choosing only those with strong rootstocks. Pack the roots, with a little soil, into pots or boxes, putting them closely together. Keep in a light position for about a week and then trim off most of the leaves. Following this, place them in a cellar or a dark shed, where there is a fairly even temperature. The leaves develop all the more quickly if pots or boxes are inverted over the clumps. This

tends to keep the atmosphere surrounding the plants close and moist, so that growth is more tender and delicate. Of course a much quicker growth is secured if the dandelions are on a hot bed and it is often possible to find a corner where a few pots or boxes can be placed. In a warm position the roots will need a good deal of water. The leaves may be gathered until the roots show signs of being worn out and these are then thrown away.—S. LEONARD BASTIN.

LIME FOR BRASSICAS.

IT is almost safe to say that every gardener grows some members of the brassica or cabbage genus and though the plants are among the easiest to grow, yet the ultimate crop is not always to the credit of the grower. Years of experience show that one important reason for the irregularity is a failure to realise the value of lime for such crops. No other plants in the garden resent more the slightest tendency to sourness; even a wet season upsets the uniformity of the plants and heavy soil or richly manured land, which should bear first class plants, only does so with highest satisfaction when lime has been used beforehand. Lime, as is known, removes all sourness, but it also promotes those soil conditions so encouraging to the strong roots of all such plants; they revel in the actual presence of lime, and the lime indirectly confers benefits by ameliorating the soil texture, by disintegrating the humus and by promoting drainage. I emphatically urge a lime dressing as a preliminary to cabbages, cauliflowers, broccoli, sprouts, savoys, and so on, and preferably some months in advance, so that the chemical may permeate the ground and make it a place "fit for brassicas to live in." In heavy land, in land super-rich in humus as most garden soils are, two stones per rod are not excessive; half that will often do in ordinary soil; good quicklime, slaked and then dug in is best, but all forms of lime are good.—C.

MISCELLANEOUS

BASIC SLAG.

UNLIKE many other garden fertilisers, basic slag or slag is a commodity which may vary within wide limits. From a garden point of view its value lies in the amount of available phosphate of lime which it contains; it also contains a fair proportion of lime in a free form, but this need not be considered. Fineness of grinding is also of great importance, but samples offered nowadays generally prove quite satisfactory in that respect. It is really a difficult matter to state how the average amateur may decide which kind of slag is best; a firm of good reputation may be depended upon to give value for the price charged, while those who wish to buy low and doubtful grades may seek gratis advice from the nearest Agricultural College. Generally speaking, a highly soluble slag is best in the garden, most particularly in those parts where the winter rainfall is not excessive. The best time to apply slag is between September and February; it ought to be mixed as well as possible with the soil so that its "goodness" may permeate the whole and be readily available for cropping, when the plants make a call upon it in spring. The quantity to apply may vary from 3oz. per square yard, high values, to 8oz. per yard, low percentage slag; this varies from 5lb. to a stone per rod. Slag proves of great value for all kinds of fruit, including strawberries, for turnips and swedes, peas and beans, and many others; it is a fine manure for the lawn when the soil is on the heavy side (it may encourage clovers, however). As a phosphatic manure for heavy land it is one of the best.—HUGH AITKEN.

THE LONDON ALLOTMENT SHOW

NOW that this Society seems to have firmly established an annual show, we should expect that the management will, in future years, divide the competitive classes into district sections. At present competition is open to societies and members of societies cultivating allotments within the Metropolitan Police Area, so that the exhibitors came from Beckenham, Brockley, Hampton, Windsor, Watford, Southgate, Well Hall and other places which are still, as far as cultivation is concerned, country. As might be expected, many of the chief prizes were won by vegetables grown in these districts. It is manifestly unfair to expect allotment holders, no matter how enthusiastic and skilful, residing at Palmer's Green, Chiswick Park, Willesden and East Ham, for example, to compete on equal terms with those from the outer area, while within the limits we have roughly outlined there is a large number who have even smaller chances of success.

It would be idle to claim that every plot-holder is an expert cultivator or that all make the best possible use of their opportunities. But as those who go about the country are well aware, the majority "do their plots well," and the wonderful success attained by the most enthusiastic was abundantly evident at the show which was held at the Royal Horticultural Hall, Westminster, on September 3rd and 4th.

A very comprehensive schedule had been drawn up. There were 1,300 entries, which was said to be an increase of fully twenty-five per cent. on last year, while the quality throughout the many classes, and the many more exhibits, was exceedingly high. In some instances the exhibits closely approached perfection.

Each of the eight collections of twelve kinds of vegetables grown by members of one society on their allotments was an excellent example. They were all composed of splendidly grown vegetables—cauliflowers, peas, leeks, celery, runner beans, tomatoes and such—admirably displayed. The quality was no less high in the class for individual growers, where eleven set out most praiseworthy collections of six distinct vegetables.

As is only right and proper, potatoes were of great importance at this show and we question whether better tubers were to be seen at the recent vegetable show of the R.H.S. The very many exhibits in the single dish classes, as well as the collections, were all composed of tubers of perfect form, clean-skinned, of moderate, useful size and quite true to type. The varieties most favoured by the allotment holder seemed to be King Edward VII, Tinwald Perfection, Arran Comrade, Royal Kidney, Di Vernon and Majestic.

Of the other vegetables, perhaps the very best were tomatoes, runner beans, onions, carrots, beet, leeks and peas, though, except marrows, all were equal to the best exhibition standard. The only fault that could be found with the marrows was that some were a trifle too old for culinary purposes. It is said to have been an unfavourable year for marrows on the allotments and in some commercial gardens. But plenty of marrows have been grown somewhere, for they have been a glut at Covent Garden Market and good marrows large enough for a family of three or four have been retailed at a penny each.

The skill of the allotment-holder is equally as great with flowers as with vegetables, for there were handsome vases of hardy border flowers. Gladioli, sweet peas, dahlias, asters, salpiglossis and roses; while, as was to be seen by the many lovely table decorations, the lady members possess the ability to arrange the flowers with great artistic skill and taste.

BOOK REVIEW

THE demand for horticultural literature must, indeed, be a large one, if one is to judge by the constant stream of volumes on all aspects of gardening which make their appearance every year. Many of these contributions are of a temporary nature. They are suddenly born, flourish for a short time, and then just as suddenly die. Others, again—of which the present work, "A Handbook of Flowering Trees and Shrubs for Gardeners," by R. C. Notcutt, edited by the late W. R. Dykes; (Martin Hopkinson and Co., Limited, price 12s. 6d.)—is one, are more lasting. The reason is evident. These latter are books written by a practical authority, and give first-hand personal knowledge and experience which the keen amateur grower is always desirous of obtaining. This is true of Mr. Notcutt's volume. The book is practical throughout, clear and concise in its style and accurate in its information. Naturally, one does not look for much new information in a tree and shrub volume, since we have already a standard work on the subject; but what one has realised, and what this present work has filled is the need for some practical advice about shrubs.

In a way, the title of the book is a misnomer, as only some few genera are treated in its pages. Certainly these contain the better known and more popular of our shrubs, but it is a little unfortunate that other equally important families could not have been included. After all, it should be the aim of a book such as this to draw attention to subjects which ought to be more grown in our gardens, and not to follow on in the wake of public popularity. Through time, no doubt, Mr. Notcutt will rectify these sins of omission in the present volume, at some future date.

The genera treated in the book are twelve in number and comprise berberis, buddleias, ceanothus, cistus and helianthemums, cotoneasters, cytisus and genista, prunus, flowering cherries, pyracantha, pyrus and viburnums. Useful descriptions in simple language are given for each species and variety, and the amateur will find all the information readily palatable. The author writes from a first-hand knowledge of the subjects. The chapter on Seaside Planting is a most excellent one. Much timely advice is given and the lists of shrubs suitable for this purpose will be found of the greatest help to those who are gardening at the seaside. It is one phase of gardening which is on the increase, and Mr. Notcutt's advice should do much to stimulate interest in the growing of plants on or near the sea coast, and assist seaside gardeners to success in their enterprise.

The introduction is full of homely and practical advice on the treatment of shrubs, including pruning and propagation, which, to the amateur, should prove invaluable. Much of the author's information will be new to many, coming, as it does, from the recent experimental work which has been and is being still carried on at the Royal Botanic Garden, Edinburgh. The amateur should pay close attention to this chapter because most of it is good sound advice and represents much knowledge acquired in the last few years.

The outstanding chapter of the work is that on the Japanese cherries, contributed by Mr. Collingwood Ingram, who is an acknowledged authority on these trees. This chapter should do much to popularise the growing of these beautiful and charming trees in our gardens, more especially since Mr. Ingram completes his chapter with a list of kinds which will prove hardy in this country.

The book is remarkably free from errors in nomenclature and misprints. It is well printed, and the illustrations which appear are good; but one wishes there had been more, especially a few of the shrubs growing in the garden, rather than sprays of fruit or flower. The value of good illustrations in a book of this description is inestimable. With the exception of this fault, if it may be termed a fault, the book is excellent as far as it goes and is well worth the close study of every keen gardener, especially if he be a shrub enthusiast.

G. C. T.

CATALOGUES RECEIVED.

Messrs. Hewitt and Co., Solihull, Birmingham.—A catalogue of roses as well as this firm's famous Wexham strain of delphiniums. This strain of delphiniums combines grace of habit with varied and gorgeous colouring and robustness of constitution. Each spike has an elegant tapering habit, and in many of the recent introductions the spikes are of immense height. A catalogue of choice bulbs, including the best of the modern narcissi, tulips, irises, hyacinths, crocuses, and miscellaneous bulbs was also sent.

Messrs. Sutton and Sons, Reading.—This firm's new bulb catalogue is of more than usual interest, particularly just now, as it is high time that preparation for next spring's floral display be made. Bulbous plants are the chief class of flowers which bloom at intervals from Christmas to May, and during that time, by careful choice, there need be no period when either the garden, greenhouse or home is without flowers. A selection of suitable bulbs to form this succession can easily be made from Messrs. Sutton's well classified bulb catalogue, which contains not only colour descriptions, but useful cultural hints also.

Messrs. Joseph Fison and Co., Ipswich.—The lawn needs particular attention during the autumn. To have a really good lawn it is essential that the weeds be removed, the soil aerated and rolled, and, above all, that food in some form be applied. Lawns soon become impoverished if some complete fertiliser is not added. Messrs. J. Fison and Co. is a firm which has specialised in the manufacture of lawn fertilisers and lawn sand for many years, and every gardener would be well advised to write for their small brochure on turf cultivation.

TRADE NOTE.

For the convenience of residents in the London area a special showroom has been opened by Messrs. Boulton and Paul at 135–7, Queen Victoria Street, London, E.C.4. It is often a little difficult to purchase from a catalogue, and always a great advantage to see and examine the precise article you are buying, and this showroom will be of immense utility to residents in London and the home counties. There will be showroom specimens of the famous Boulton and Paul greenhouses, garden frames, etc., on view, and the keen gardener will find it worth his while to make a visit.

"ACME" WEED KILLER

Awarded Gold Medal at Anglo-American Exhibition and Bronze Medal by Royal Horticultural Society.

Has stood the test of over 30 years.

POWDER.—No. 1 Tin makes 25 gals., 3/-; postage 9d. No. 2, 50 gals., 6/-; postage 9d. Carriage paid on No. 4, which makes 150 gals., 15/-

WAKELEY'S Celebrated Hop Manure

(PATENTED)

THE ORIGINAL AND ONLY RELIABLE SUBSTITUTE FOR STABLE MANURE

AS USED IN THE GARDENS OF GREAT BRITAIN

DIPLOMA AND MEDAL, ROYAL INTERNATIONAL HORTICULTURAL EXHIBITION, 1912

DO YOU REALISE IT?

A large bag of WAKELEY'S PATENTED HOP MANURE at a cost of only 7/- carriage paid to your door (if within 25 miles radius of London, or at a trifling extra if beyond), GOES AS FAR AS A CART-LOAD OF STABLE MANURE, without any of the defects of the latter; gives better results, is easy and clean to use.

Every ounce of Wakeley's Hop Manure is of value to the soil, supplying the necessary HUMUS in addition to the valuable plant food. Worthless rubbish is not added to make weight (as is the case of some artificial manures advertised).

Thousands do realise it, the proof of this is the constant flow of UNSOLICITED LETTERS received from time to time in praise of the wonderful results obtained at such a moderate cost (see Booklet for selection).

BEWARE OF IMITATIONS.—Genuine Only in our Marked Bags containing Guaranteed Analysis.

ILLUSTRATED CATALOGUE giving full particulars and testimonials sent on receipt of post card.

CASH PRICES (including bags):

Small (about 1 bushel)	3/-
Large (about 4 bushels)	7/-
5 Large	33/6
10 Large	65/-
20 Large	120/-

Carriage paid by Pickford's or to any station within 25 miles of London, including delivery if within free delivery radius of Railway Company; 6d. per bag extra for every 50 miles or part beyond. Maximum extra charge Great Britain, 2/6 per bag.

WAKELEY BROS. & CO., LTD.

75a, BANKSIDE, LONDON, S.E.1

Burpee's
NEW SWEET PEAS for 1927

GLADNESS A soft coral-pink, intensified by a suffusion of a deeper shade toward the base of the standard and wings. The softest and daintiest of all pinks. Of exquisite delicacy, enhanced by a lemon keel.

DELIGHTFUL A rich terra-cotta cerise, suffused orange or scarlet-red. A colour never before produced—the most appealing, in its glowing beauty, of all the richer toned varieties; bright and shining even on dull days, and startlingly brilliant under artificial light.

ROYAL BLUE A true Royal Blue, but full of life and brilliancy instead of dull and uninspiriting; undoubtedly the brightest of all sweet pea dark blues. A flower of great substance and enchanting beauty, extremely prolific in fours.

Notes from Maidstone.

MATRIMONIAL NEWS

There are journals we believe which bring together those desiring to marry, and now that we learn that some fruits require such introductions, and as they are fastidious in the choice of their affinities, it seems necessary to provide a Pomological Matrimonial Agency. Failing this desirable institution, our Fruit Catalogue must serve as a medium, and the marriages which science has blessed are indicated, where known. Of special interest and rarity are those couples which are mutually satisfactory. All planters of Cherries and Plums should gravely consider this point before making final decisions.

VOL. XC.—No. 2860. SEPTEMBER 25, 1926 PRICE TWO PENCE.

THE OLD ORDER CHANGETH

IN bygone days, when THE GARDEN was in its infancy, the science of gardening was only known to a few, the magnificent body of professional gardeners who have done so much to bring British horticulture to its present supreme position. Slowly but surely the desire to learn has spread, as more and more people have become attracted to horticulture. A hundred gardens exist to-day where there was only one before; but the hundred differ from the one in that they are tended and cultivated to a large extent by amateurs.

This is a statement of fact that no one will gainsay. In the past, THE GARDEN has appealed to the enthusiastic specialist, to the experienced gardener, to those who have liked searching into the byways of horticulture. There has, perhaps, been too little appeal to the ordinary amateur. We believe that frankness, which has always been a policy of this paper, has been appreciated by our readers. The policy of frankness will be continued, although readers will find that in other respects this issue of THE GARDEN differs from all previous issues.

Since in the past we catered for the advanced horticulturist, we regarded the main issues of horticulture as already learnt. We began above the heads of that enormous body that has come into being within the last few years. In the future we shall cater for everybody. There is *no* suggestion of lowering the quality of the material. Because we give advice on the simpler side of gardening, there is no reason why it should be of inferior quality. Our policy in future is not to give less information, but more, much more.

If you will take this issue as a sample and examine its pages, you will see the various details that will be given, for this is no abnormal issue, except for the coloured cover, which is one of our most popular features, and will be seen oftener in future.

As this is the time of year when most gardeners are thinking of garden design and garden alteration, we have arranged for the grand old lady of British gardening, Miss Gertrude Jekyll, to make for THE GARDEN a series of designs. They will show various phases and features of an average sized small garden. Miss Jekyll is so well known that it should be unnecessary to say that the designs will be strictly practical and adaptable to almost all positions and situations. The first of the series begins in this issue, and we are sure that all readers who are planning or about to plan a garden will find them both instructive and useful. Another page is devoted to roses. Two problems often confront the amateur rose grower: which roses retain their colour, and which are vigorous? The answers are given here. Then follow notes dealing with fruit and vegetables and an entirely new feature, the Busy Man's Page, where the man who can only spare an hour or two to his garden can gain week by week a great deal of information in the minimum of space. This should be exceedingly valuable to many busy people. It will be seen that there is information in the pages of THE GARDEN for most of the gardeners of the British Isles. And all this for 2d. a week—a remodelled paper, a new price.

We have been frank with you as readers of THE GARDEN. We, in turn, hope that you will be frank with us. In the past we were proud of our position as THE paper for the advanced gardener. In the future we hope to be proud of our position as THE paper for ALL gardeners. But in order to gain this position our readers must help with suggestions and advice.

E. H. M. C.

HAVE YOU

¶ *Sown your half-hardy annuals for spring flowering in the greenhouse?*

¶ *Lifted your violet plants for forcing?*

¶ *Taken your pentstemon cuttings?*

¶ *Finished propagating your violas and calceolarias?*

¶ *Planted your lilies of the valley?*

¶ *Pruned your morello cherries? This is the best time for this important operation.*

¶ *Remembered your successional plantings of lettuces?*

¶ *Lifted all your onions and harvested them in a dry shed?*

¶ *Cleared the space occupied by your tomatoes?*

The Holland Park Show.

EACH year the great autumn show at Holland Park improves, and demonstrates more and more clearly what can be done to beautify our gardens in the autumn. Not so long ago gardeners set their hearts on making their gardens supreme during spring and summer, and relaxed their efforts towards having autumn colour from flowers, foliage and berries. Now this is altered, and enthusiasts consider the autumn nearly as important as the other seasons. However, there still remains a great number of otherwise keen gardeners who do not sufficiently realise what modern horticulture has done for the autumn garden. Not only does this apply to flowers, but also to leaves that colour magnificently and berries of vivid tints. Many of the maples and berberis and plants like Rhus cotinus and Cercidiphyllum japonicum have come to stay, owing to the glory of their autumn tints. What can be more wonderful than the berries on some of the pyracanthas? In the same way Gentianas Farreri and sino-ornata, autumn-flowering crocuses, dahlias and Michaelmas daisies have improved the flower colour of the autumn to an extent that our forefathers never believed possible. These are only a few of the plants which make such a marvellous autumn show. Each year the garden can be made more full of colour the year round.

All those who can will have visited Holland Park, but to those who have been unable to spare the time, no better advice can be given than to watch the pages of THE GARDEN carefully during the next few weeks and so learn of the various plants that contributors and readers mention, so that they may be in a position to improve their autumn garden next year.

Owing to the many alterations that have been made in the present issue of "The Garden" and the greatly increased demand received from the Trade for this issue, a very much larger edition has had to be printed, with the result that arrangements have had to be made with the printers to go to press earlier than usual. In view of this the Holland Park Show Report has unavoidably been held over until our next issue, where a fully illustrated account will appear.

ROSES OF GOOD CONSTITUTION

PURCHASERS of rose trees may, generally speaking, be divided into three classes—(1) those who from personal experience of the varieties, and having due regard to the nature of their soil and locality, know exactly what they require; (2) those who on the recommendation of friends or from catalogue descriptions are prompted to acquire them; and (3)—probably a not inconsiderable number—others who, having become enamoured of blossoms staged at some exhibition, give an order for delivery of trees in the following autumn without any knowledge as to their capabilities as garden roses or of their constitution. It is, I think, mainly this latter section of purchasers, who realise, only too often, a certain amount of disappointment when the trees bloom in their garden and it is found that growth is far from robust, and that, even when established, they fall short of their ideal. It is one thing to admire a group of blooms effectively staged in an exhibition tent, which in all probability have been grown for that special object, and quite another matter to attempt to grow similar superb flowers from bushes in one's own garden. Sooner or later one is apt to wake up to the fact that some roses are capricious. Happily, however, there are many roses of vigorous constitution that can be depended upon to do well in any fairly good soil and open situation. They need little or no recommendation, as, owing to their long career and their marvellous freedom of blooming, they carry their own testimonial.

The Glory of Caroline Testout.

From my window where these lines are written this summer morning my eyes rest upon a bush full of silvery pink blossoms, a tree which has occupied the same position close on thirty years. Never once has Caroline Testout disappointed me in all that time in giving of its best. How many thousands of blossoms it has produced it would be difficult to compute! I have always gathered flowers in early June, often in May and always, without exception, in late October. This variety is to be found in many gardens. It is regarded as essential to every large collection, and maintains its popularity because of sheer merit. Every nurseryman dealing in roses knows the value of Caroline, as they are never wrong in recommending it. I have long since come to the conclusion that if ever the National Rose Society awards its D.S.O. for varieties of worth and long service, then surely Caroline Testout will be among the recipients, for it is altogether a worthy rose.

Some Robust Varieties.

One is glad to note that modern raisers are paying much attention to the production of vigorous, robust sorts, and whatever charges may be brought against them in those of recent introduction lacking somewhat of perfume, it cannot be said that they are neglecting the essential of good constitution; The familiar indicator "V" in trade lists is noted by would-be purchasers in selecting sorts of healthy, vigorous constitution, because, among growers to-day, there are not a few whose gardens lie in and near to towns and cities, so that roses possessing robust habit are necessary. In that most popular section, the *Hybrid Teas*, we can claim quite a number that are ideal for the general grower. Here are some of them: General McArthur, Hoosier Beauty, Una Wallace, Rev. F. Page Roberts, Ophelia, J. G. Glassford, Betty Uprichard, Mme. Mélanie Soupert, Clara Curtis, J. B. Clark, Mrs. Henry Bowles and The Queen Alexandra Rose.

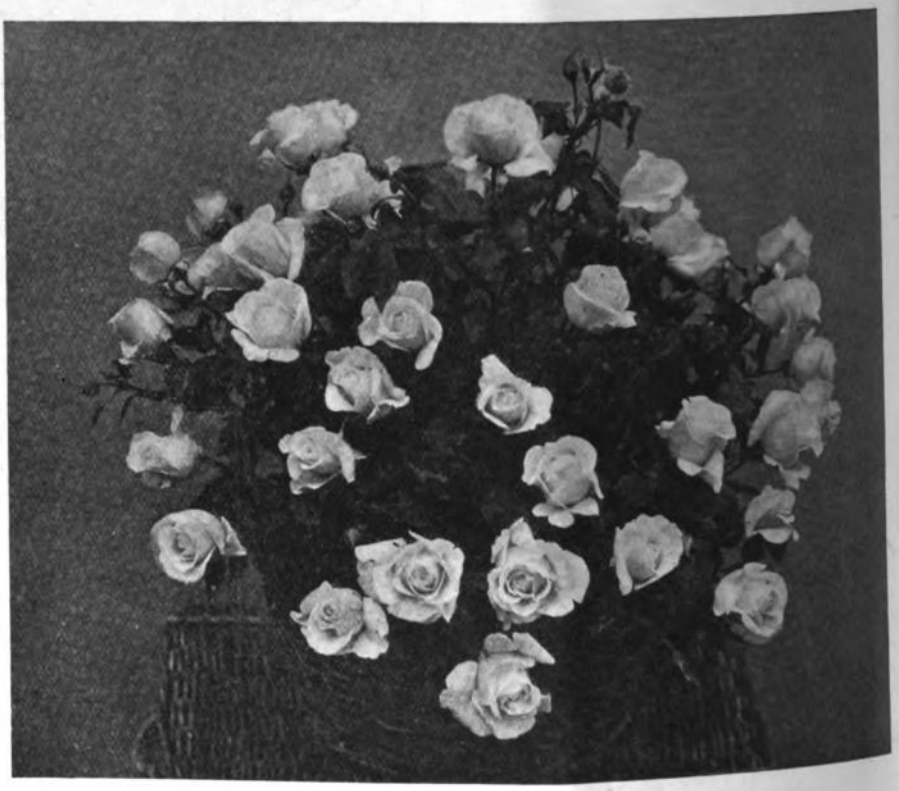
Hybrid Perpetuals.—Hugh Dickson, Frau Karl Druschki, Annie Crawford, Mrs. John Laing and Captain Hayward.

Singles.—Isobel, Mrs. Oakley Fisher and Irish Fireflame.

Climbers.—Albéric Barbier, Paul's Scarlet Climber, Blush Rambler, American Pillar, Excelsa and Sanders' White.

One noted firm of rose growers, in issuing its list every year, takes the trouble to publish the names of varieties they no longer offer for sale because of other and more modern sorts being judged better. Among the names I notice some that do not come up to the standard of vigorous constitution. This I look upon as useful information to prospective buyers. Their slogan is "Grow the best, discard the rest." It is one worth bearing in mind.

W. LINDERS LEA.



A FINE BASKET OF THE POPULAR ROSE MRS. HENRY MORSE.

Roses that Keep their Colour and are not Scorched

ON one of those sweltering days about the middle of July I was in a country garden admiring roses which were opening in such quick profusion. It was early morning as I stood before a pergola covered on one side with that old and not easily ousted variety William Allen Richardson. There were many clusters of half-opened buds revealing the exquisite deep orange yellow tints. Before noon the petals had fully expanded, but the delightful colour had gone, leaving them bleached and washed out. What happens with this rose does so with many others, and unless they are given some temporary shading the sun scorches them to such an extent as to make them almost unrecognisable.

In such a season as the present one, when the thermometer for days stood in the neighbourhood of 80° to 84° in the shade, comparatively few roses were exempt from losing colour, although some did not seem to be much affected. My experience with climbers that keep their colour and do not scorch very much is presumably that of many others. In the glare of hot sun I find that Hiawatha retains much of its crimson, and lasts longer than almost any rose I know. Excelsa (crimson) and Paul's Scarlet Climber came out of the ordeal very well, but American Pillar soon lost its lovely shade of pink.

All roses of a coppery or golden shade are subject to bleaching more or less, but Lady Pirrie and Los Angeles, with me, seemed to be affected the least. Fisher Holmes, one of the oldest of the hybrid perpetuals and seldom seen to-day, kept its crimson scarlet flowers wonderfully well in the trying days of abnormal heat. I cut a few blooms of Edward Mawley, that beautiful velvety crimson hybrid tea, on a day that would try the most "warranted fast colour," and was surprised at the excellent tints.

Among pinks, Mrs. Henry Morse, while not being entirely immune from scorching, came out of the heat much better than one expected, and the same remarks are true of the salmon pink Mme. Abel Chatenay, the blooms of which, I think, are almost as beautiful when slightly bleached as when they first open in the morning before the sun has time to leave its mark upon them. One of my dark crimson roses, Hadley, also gave a very good account of itself in the torrid heat, as did the single Isobel. Margaret Dickson Hamill, one of the best of its class, continues to be more largely grown every year, and though losing some of its fawn yellow colour in trying heat, is a variety to be looked upon as good for the garden. Still one of the most sweetly scented of our hybrid perpetuals, Hugh Dickson proves a grand rose even in almost tropical heat, and as a crimson scarlet it is, in its class, one of the best. Still another, though newer, crimson hybrid tea that is sunproof is Bedford Crimson. In this case fear of scorching is practically eliminated.

PLANTS AT THEIR BEST IN LATE SUMMER

This is the first of a series of contributions to THE GARDEN *by the well known writer on horticulture, Mr. A. J. Macself. It is really an enlargement of our "Worthy Plants" that has been such a popular feature.*

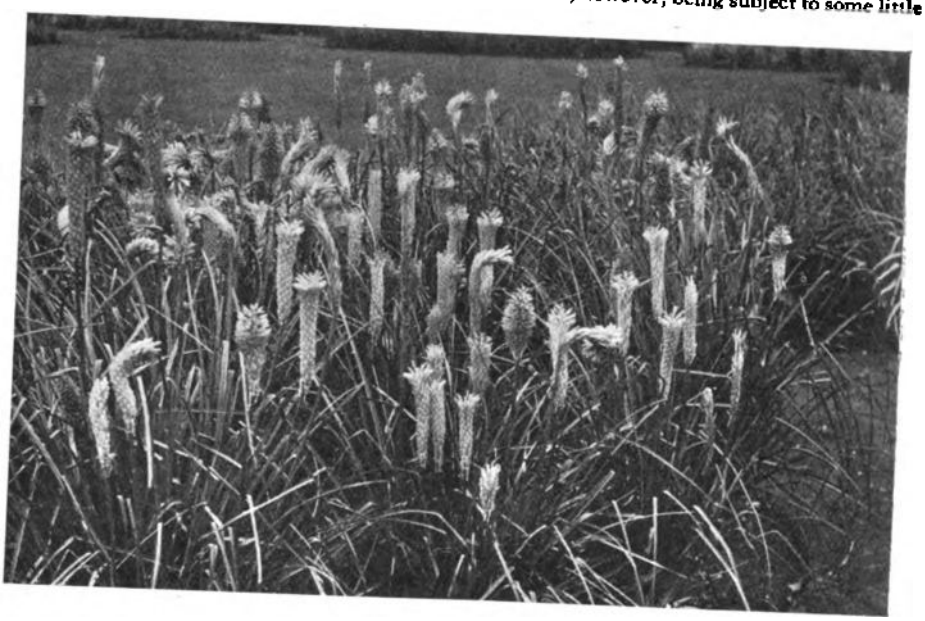
Ceratostigma plumbaginoides.

BLUE is not plentiful in the garden after the gold and bronze of autumn bursts upon the scene, and it is often said that the rock garden has only a tithe of the floral beauty in autumn it has in spring. Strange, then, it seems that a plant which is of easy culture and which bears flowers of a soft, pleasing shade of blue in autumn is as seldom met with to-day as it was twenty or thirty years ago. Under the synonymous name Plumbago Larpentæ I grew this plant before the dawn of this century, and found it luxuriant in growth, the glossy green of its foliage and ruddy hue of its stems being at all seasons delightful. It has been laid to the charge of the leadwort (to give it a so-called popular name) that it flowers too lazily to be effective, but if the simple precaution is taken to thin out the crowded growths of a fair-sized clump, that the stoutest growths may get the benefit of summer's sunlight and air, flowers will not be scarce. A fine mass about 4ft. across, which I have had under observation for several years, is thus treated, and every year, from about September 7th or 10th and on to the end of the month it is one of the best of good things, often flowering through the greater half of October. In some gardens flowers are freely borne in August.

Brilliant as a Burning Bush.

ZAUSCHNERIA CALIFORNICA blooms just now with unequalled freedom. It is an extraordinary plant, and would be far more conspicuous in British gardens if a mistaken notion that it requires coddling treatment were dispelled. It has to be admitted that many plants of zauschneria have been failures, but in the majority of cases the real reason has been that cosy corners have been selected and rich composts provided, with the result that the plants have made rank, soft growth which has fared badly during winter.

In a neighbouring garden is a bank which originally was formed by dumping builders' rubble, road sweepings, ashes and other harsh material. This was covered with ordinary soil held up by rows of rough stones and clinkers. The position is fully exposed to sunshine, and often in summer it is baked so hard that even aubrietias and alyssums are seared and scorched. Here Zauschneria californica has grown so well that sucker-like growths with stems tough as wire wriggle their way to daylight through chinks between the stones and clinkers, and just now the growths are literally ablaze, the shining flame-coloured tubular flowers being as brilliant as a burning bush. Spring planting from pots is recommended.



THE SEALING WAX RED SPIKES OF KNIPHOFIA ERECTA.

A Fine Red Hot Poker.

THE kniphofias—or tritomas, as they are still as frequently called as by the first and more correct name—are a vastly improved and still improving family. By intermixing a number of distinct species, plant breeders have given us some lovely hybrids, varying in size, stature, colouring and in season of flowering—the latter, however, being subject to some little variation according to aspect, environment and season.

At the present time, Kniphofia erecta is the most effective of a fairly representative collection, and among the whole tribe this is particularly noteworthy as possessing distinctive merit. Its colour is deep rich red, almost of sealing-wax tone; but the outstanding feature of the torch-like inflorescence is in the upward direction in which all the tubular florets grow. This is not alone a matter of interesting peculiarity, but has an important practical value. The one drawback to most kniphofias is that the pendent florets around the base of the inflorescence fade and assume the unsightly colour of decay before the topmost florets have fully developed; but in K. erecta this defect is eliminated, and the basal florets, being fully exposed to view, contribute most to the glowing effect of the spike which, in an accentuated degree, justifies the common name of the genus, the "red-hot poker."

LA TOSCA IS ONE OF THE BEST AUTUMN ROSES.

A Jewel Among Autumnal Roses. La Tosca.

WITH all the glory of our modern highly coloured roses of the pernettiana class, we have not lost affection for—or, indeed, the particular need of—this old but exquisite rose, which a quarter of a century ago (the rose was introduced the first year, or thereabouts, of the present century), was hailed with delight as an exceptionally fine autumn rose.

It is just now making a perfectly delightful show, and, as seen in the illustration, is thoroughly capable of making an effective display in a bed to itself.

The colour of La Tosca is delicate blush with quite a silvery sheen, and the form of the flower and habit of growth possess extreme elegance. La Tosca is a rose which should be but lightly pruned in spring, but it benefits in an especial degree by being judiciously relieved of spent growth during July.

YOUR BULBS

HOW TO GET THE BEST OUT OF THEM

Useful Hints about Potting and Planting Bulbs.

FOR some weeks now we have had the autumn bulb catalogues before us and, if the orders have not already been sent in, no time should be lost. There is no doubt that with bulbs, whether these are grown indoors or outside, early planting is likely to give the best results. When bulbs are grown in pots or bowls for winter flowering it is essential to get them settled in soil or fibre by the end of the summer. Either a fibre mixture such as is supplied by any bulb specialist, or a compost made out of rotted fibrous turf, leaf soil and sand, or even gravel so long as it is water worn, make good growing mediums for bulbs in pots and bowls. Hardly any of the early-flowering bulbs grown indoors require a great amount of heat provided they are allowed a good long rooting period. In fact, with the paper white narcissi and the early tulips a brisk heat is positively injurious. Roman hyacinths and other early varieties will tolerate a certain amount of forcing, but this is usually quite unnecessary if the bulbs have had a good chance to develop their roots. Care should be taken not to plant such bulbs as hyacinths and tulips too deep in the pot or bowl, in fact, with these two bulbs the crowns should be just clear.

When bulbs have been planted in fibre the bowls should be put into a cool place away from a strong light. A stuffy cupboard is not suitable: for bulbs are living, breathing things, and they simply must have fresh air. Keep the fibre just moist, but until active growth has started not a great deal of water will be required. Let the water be just off the chill, as if this is icy cold it will check the growth of the bulbs.

Plunging in Ashes.

Bulbs grown in pots, later to be placed in a frame or a greenhouse, are best treated in this way: Choose a corner of the garden where there will be no drippings from roofs or tree branches. On the ground spread a layer of ashes, making the surface quite smooth. Then stand the pots on this and cover with a full 6ins. of light mould, dead leaves, ashes or fibre. The covering should be thick enough to give protection from frost, and the bulbs may remain here for from two to three months. At the end of this time they will have developed a fine root system as well as a certain amount of top growth. In the case of the early-flowering varieties a moderate heat will bring them into full beauty within a short while.

Planting Bulbs in the Garden.

Out of doors very early bulb planting is not always possible. At this season many of the beds cannot be cleared of their summer occupants, but, as opportunity offers, the bulbs should certainly be placed out. After the removal of the summer plants the soil will require very little preparation to make it ready for the bulbs. A good digging with a fork so that the ground is well broken up will nearly always meet the needs of the case. The depth at which bulbs should be planted is rather an important matter. To be on the safe side, when placing in the open garden, the bulbs should be buried about three times their own diameter in the soil. The small bulbs, like crocuses, scillas, etc., will thus be about 1in. to 2ins. down; hyacinths, narcissi and tulips will be from 4ins. to 9ins. below the surface. If you are rather late in your planting, or the soil is on the heavy side, it is an excellent plan to set the base of each bulb in a little silver sand. This very much hastens the rooting of the bulb and you will be well repaid for the trouble. In any case loosen the soil well under the bulb and see that there is no space underneath, as sometimes happens in the case of careless planting.

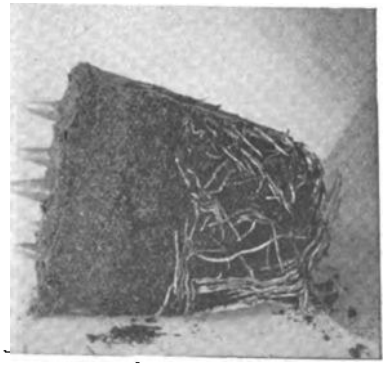
BULBS POTTED READY FOR PLUNGING.

Until the bulb is covered press the soil fairly firmly round it and then add the remainder rather lightly. To protect newly planted bulb beds from cats, etc., there is

THE CORRECT METHOD OF PLUNGING.

nothing so good as a few twiggy growths pushed at intervals into the ground.

When planting bulbs try to conjure up a mind picture of the ultimate effect when



THEY ARE READY FOR REMOVAL WHEN A STURDY ROOT SYSTEM IS ESTABLISHED.

the plants are in flower. Many people plant a number of bulbs and then get a very disappointing result in the spring. Remember that *naturally* most of the bulbous plants grow in clumps. Their chief means of increase is by means of offshoots, and the young bulbs develop quite close to the parents. This is especially the case with the smaller kinds of bulbs, which grow closely crowded together. Even with large hyacinths the distance between the plants should not be too great, or much of the effect is lost. Snowdrops are, perhaps, the least effective of all in the general border. These look best, and usually are the happiest, in some corner of the garden where there is a certain amount of shade. Here the snowdrops will settle down and grow for years, steadily increasing with the passing seasons. In very open situations snowdrops often die away after the first year, although why they do so has never been explained.

Bulbs in Grass.

Bulbs look extremely effective when growing in grass. For this it is far better to choose the corners of the lawn rather than to carry out any widespread planting. Keep the bulbs in the grass to a few limited areas and here let them be thickly planted. Ideal situations are round about the base of a tree or at the foot of a rustic arch which comes close to the grass. In these situations the foliage of the bulbs can be allowed to die down after flowering, and there will be no serious disfigurement of the lawn as a whole. When planting bulbs in grass an old knife is a handy appliance. Cut a little round of turf and carefully remove this. Now dig down into the soil and, when the hole is of the required depth, loosen the earth well at the bottom. Next pop in the bulb and press it rather firmly. Make sure that it is well set before replacing the little cap of turf, for the strong-growing narcissi have a habit of forcing themselves up by means of their roots unless they are securely gripped by the soil. If the pieces of turf have been neatly cut there is no reason why the appearance of the grass should be spoiled.

Best of all for lawn planting are the various kinds of narcissi, although charming effects are secured with crocuses, snowdrops, scillas, etc. With the small bulbs remember the importance of thick planting in order to secure the massed colour effect which is so desirable. Happily, bulbs suitable for planting in grass or for naturalisation in the semi-wild garden are to be obtained at a low price, so that there is no reason why one should plant sparingly.

Wherever bulbs are planted, whether in the border or on the lawn, it is very desirable to mark the place. A gardener should always be able to see at a glance just where anything has been planted, and if there is a label to tell him what it is, so much the better.

In conclusion, one may give a little hint which specially applies to crocuses. Where, as often happens, the bulbs are left in from year to year they should be lifted and replanted every second season. This is necessary owing to the peculiar method of increase to be found in crocuses. The new offshoots are produced on the upper part of the bulbs or corms as they are more properly called. This tends to bring the corms up towards the surface, with the result that they may be forced out of the soil altogether. The flowers will then be poor and small, and nothing like so fine as those produced by corms that are better covered with soil.

Crocuses both of the autumn and spring flowering species and varieties are becoming deservidly popular both in large and small gardens. They come at seasons of the year when ordinary flowers are by no means common, and the colours in their delicate shades are all attractive.

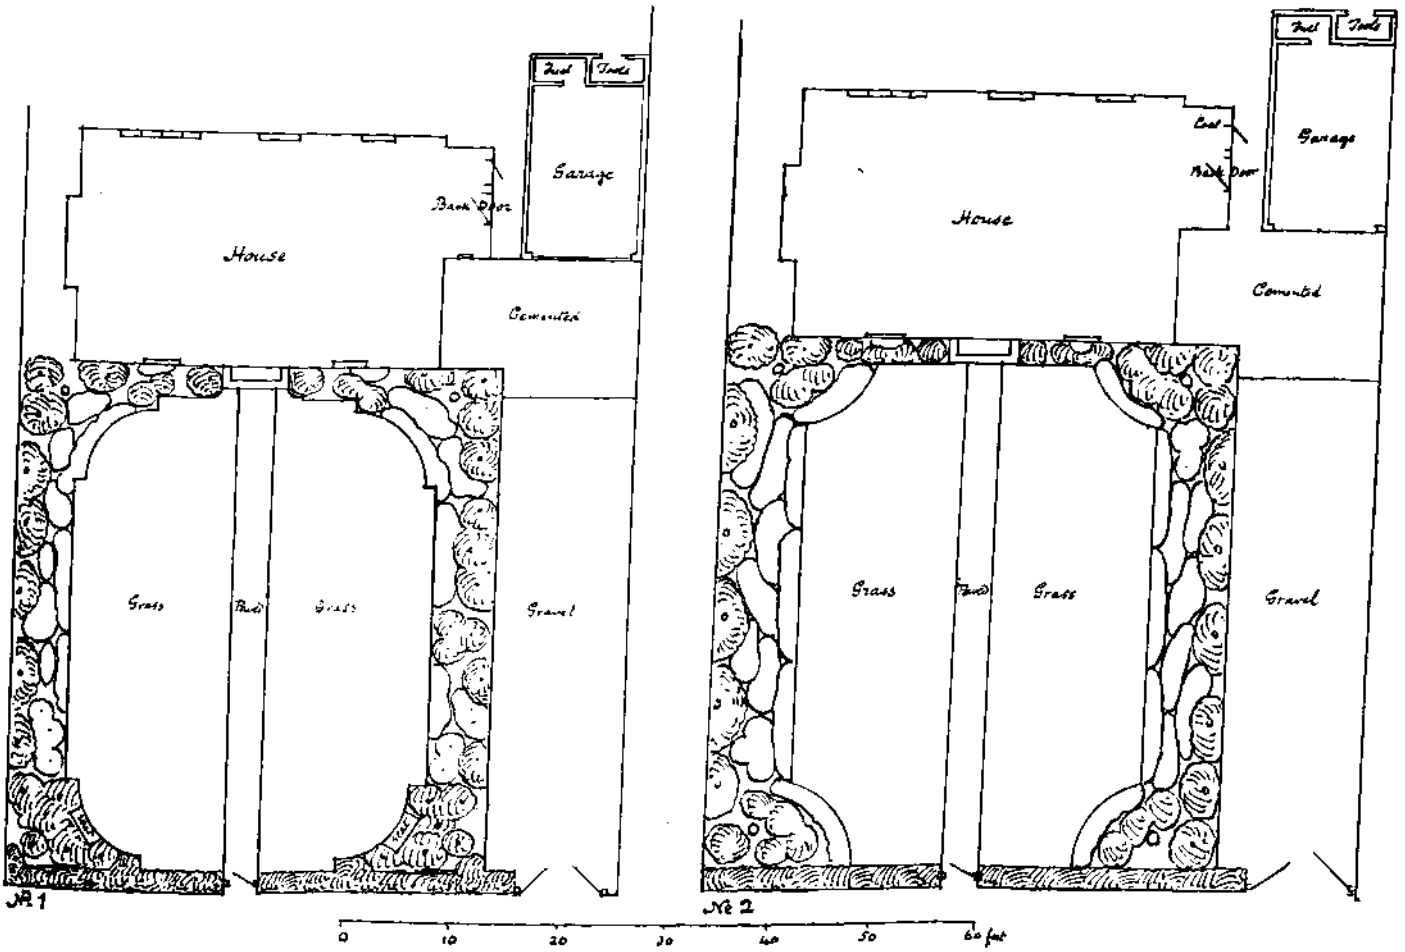
THE JOY OF MAKING A NEW GARDEN

By GERTRUDE JEKYLL.

[Many of our readers will be interested at this time in the making or remaking of their gardens. Naturally, although this is a question of personal taste, certain guiding principles are to be followed, and suggestions, as a rule, are welcomed. It is with this end in view that THE GARDEN *has arranged for a series of articles, with plans, to be published during the coming planting season commencing with this issue, and which will be one of the many helpful features of the new* GARDEN. *To make these articles and plans as helpful as possible to the amateur gardener, we have asked Miss Gertrude Jekyll to undertake the work for us. There is no one more qualified to give advice on such matters than Miss Jekyll. She has been a keen student of gardening in all its branches during the last fifty years, and has done more, along with Mr. Wm. Robinson, to raise the status of English gardens than anyone. Miss Jekyll is especially well known in connection with schemes involving the planning and planting of shrubs and herbaceous plants for colour effects, and the results of her artistic efforts are clearly apparent in the great development and improvement of herbaceous gardening in this country. Her interests are catholic, but the garden of the amateur has always been her special hobby and joy. Miss Jekyll has many novel schemes and suggestions to offer out of the well of her experience to the amateur who is planning a new garden, and these articles, with their accompanying plans, will, we are sure, be of the greatest assistance to the ever-increasing band of suburban gardeners.]*

THERE are thousands of small houses, built or in course of building, on sites of narrow form, such as are so usual in the outer areas of suburban London and on the outskirts of country towns. The owners of many of these may be glad of some general advice about laying out the ground both at the front and the back. THE GARDEN is preparing a set of plans such as will probably be helpful. The first example is that of a house just built on a site 60ft. wide by 200ft. deep. It is set back 50ft. from the road, a good plan in any case, as it is that much removed from the disturbance of passing traffic, and the depth just gives room for some simple gardening. It is this front space that will be here considered ; the treatment of the larger area at the back will come later.

For access from road to front door there is nothing so good as York stone paving securely set and the joints cemented so that no weeds can get lodgment. It is absolutely permanent and is no further trouble, while any slight litter of blown dead leaves or side sprinkle of mown grass can easily be swept up. Then a width of well kept turf 15ft. to 16ft. wide will give a sense of space and dignity, and the remaining few feet will be for shrubs and flowers. Many front gardens are already treated in some such way, but the side plantings are commonly carried straight up to the house, whereas it will be found much better to give the angles some kind of shaping, such as is shown in these plans. In both examples they give the same general treatment, but with these angles varied in detail. This will not only redeem the general plan from the obvious commonplace, but will afford more space for something specially careful and effective in the way of planting. Close to the steps to the front door a bush of box on each side is advised, and the larger bushes to right and left should be laurustinus. The windows on this side face east and have shutters, as is seen in the photograph of the house, which open flat back against the wall, so that there is not much space for wall plants, but if some wall clothing is desired the laurustinus nearest to the angles of the house can have their back branches trained up clear of the shutters. The little circles on the plans mean standard flowering trees, such as almond and Waterer's double cherry. The slight shading indicates shrubs, the other forms are groups of flowers. To give an idea of the planting, taking the left-hand side of Plan No. 1, next to the box bush to the left of the entrance steps there should be two rosemary, a bush that can be cut to any form and that will train neatly to the little sharp angle there shown. A China rose, the common pink kind, will come at the back of the rosemary and the



TWO DESIGNS SHOWING ALTERNATIVE CORNER ARRANGEMENTS OF A FRONT GARDEN PLOT FIFTY FEET WIDE.

Digitized by Google

blooms will show up pleasantly from within the room window. At the back are three laurustinus, and between them a standard almond. This corner faces north-east, and will be the coolest place in the front garden, therefore there will be a patch of Solomon's seal just in front of the almond, and next to it a group of white phlox. The shrubs on this side, planted 18ins. away from the fence, will be such as the rosy flowered Weigela amabilis, an inmate of many a cottage garden, Deutzia Pride of Rochester, Spiræa Van Houttei, philadelphus and the beautiful white Lilac Marie Legraye. In front will be groups of hardy plants—iris, peony, phlox, etc., with smaller things to the edge, such as Polygonum affine, one of the knotweeds, London pride, and, bordering the rounded curve near the house, the cabbage-leaved saxifrage Megasea cordifolia, with its handsome foliage. The opposite side will have nearly the same treatment close to the house, with a standard double cherry. Then will follow some ornamental shrubs, such as Veronica Traversii, sea buckthorn and Olearia Haastii. Next to the road there will be a hedge of Cupressus macrocarpa. In the case of a road that is fairly quiet it would be tempting, at the road end of the garden, to plant on each side five yews with a seat notched in, and one tall Irish yew at the back.

If the front garden was planted in this way it would show as nearly all evergreen next the house, so giving a comfortable effect of winter clothing and evergreen ends next the road. This would not only give a desirable feeling of seclusion from the thoroughfare but would serve as a quiet background to the flowers in the borders as seen from the house. Plan No. 2 shows an alternative treatment of the angles and slightly wider borders for the shrubs and flowers.

THE HOUSE AND FRONT PLOT FOR WHICH THE PRESENT PLAN WAS DESIGNED.

The plan of the back garden of this house will be published in our next issue along with a further article.

ANTIRRHINUMS FOR PRESENT SOWING

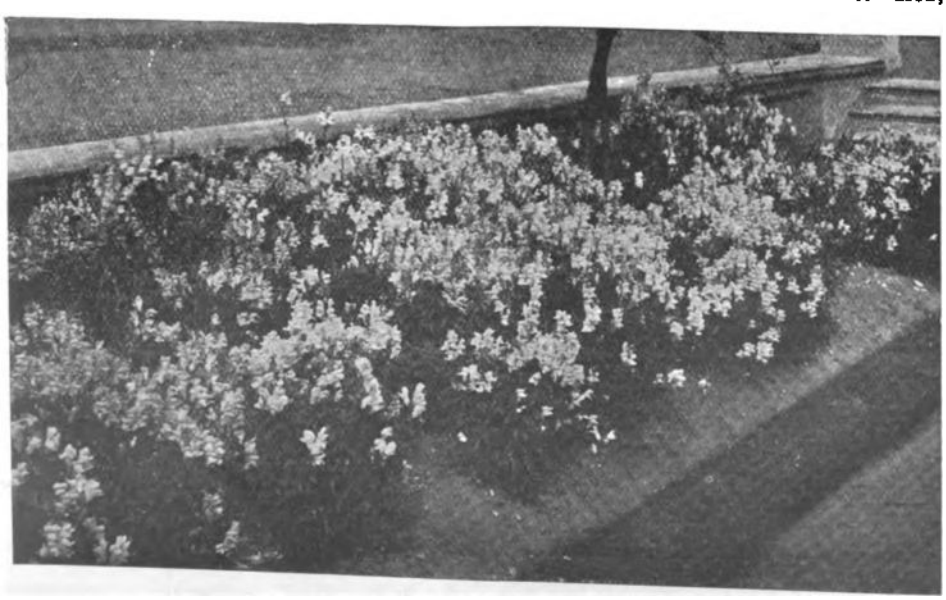
If an early floral display is desired in the garden next summer, then attention should be given to the immediate sowing of the majority of our hardy annual flowers. Although not strictly an annual, the Snapdragon is best treated as such, and if seeds of some of the varieties given in this article are sown during the next few weeks, the resultant plants if properly grown should be more robust than those sown in the spring.

Some Points About Autumn Sowing.

THEORETICALLY, autumn-sown antirrhinums should invariably be superior to those which are sown in spring; actually, a good many disappointments and partial or total failures are experienced, and it is not uncommon for spring-sown plants to outpace the autumn sown.

Recognition of a few simple facts will enable the raiser to avoid the various causes of failure, and it is well worth while to exercise proper care in handling one's seedlings, for the advantages that can be obtained by using autumn-sown antirrhinums really are very considerable. Common causes of failure are too much nursing, or "coddling," as the gardener terms it, too soft and rich a soil in the seed bed or the boxes used, over-crowding, and, finally, stunting the plants before bedding out in spring.

Antirrhinums are hardy enough so far as ability to withstand the severest frosts is concerned; they are very impatient of winter damp, and even more so of grimy deposits on their stems and foliage. To the last named is due the fact that antirrhinums do not winter well in the London district, while in much colder, but drier and cleaner atmospheres they pass unharmed through the winter, young seedlings and old plants alike suffering no harm on cold bleak hillsides or on the cliff gardens around the coast.



ANTIRRHINUMS, WHEN MASSED, FORM A PRETTY COLOUR BORDER.

Dates for Sowing.

Where one's garden is of porous, gritty and well drained soil, and where the atmosphere is not smoke laden, there need be no hesitation over sowing antirrhinum seed in the open any time between, say, September 20th and October 10th, and it may be noted that small seedlings almost invariably pass through the winter more satisfactorily than larger plants with a considerable amount of soft stem and foliage. Early sowing is, consequently, by no means an assured method of avoiding failure.

Mother Earth is a far better bed for young seedlings than the most carefully prepared compost in a box, and outdoor sowing is to be strongly recommended except where stagnant damp or a polluted atmosphere discounts the advantages. Obviously, a seed-bed requires to be clean, both in regard to weed seeds and ground pests, but it should not be rich with manure.

Those who have to contend with the disadvantages of wet, heavy soil or smoky

Digitized by Google

atmosphere will be driven to protect their seedlings, but they will be well advised to make up a well drained bed of porous soil in a cold frame in preference to sowing in boxes and wintering the seedlings in a heated greenhouse. Sow seeds very thinly, because it will be necessary to allow the young plants to remain undisturbed until the new year has spent several weeks, and anything approaching overcrowding in the seed-bed is distinctly detrimental to proper development.

After-Treatment of Seedlings.

The frame should seldom be closed entirely, and on clear, fine days the lights may with advantage be drawn right back for a few hours. There is no advantage whatever in encouraging development of big top growth, the one necessity being to secure good roots and stiff, stocky stems.

For pricking out seedlings thus raised—a task for the early days of February—there is nothing at all to equal a frame-bed on a very mild hotbed. This secures just the soil warmth necessary to promote root activity and avoids a heated atmosphere. The notion that by bringing up plants from a cold frame into artificial heat they will be urged into good growth is imagination, unsupported by practical experience. The tendency of these days to ignore the utility of the hotbed is one rather deplorable instance of error of judgment on the part of modern horticulturists.

Where hotbeds are impossible the best plan will be to fill some boxes with gritty compost, prick out the seedlings from the frame and, having just warmed the soil in the boxes, place them on shelves in a cool, airy greenhouse kept at a steady temperature just above freezing at night. The open ground seedlings will be best left until they show signs of making new growth in early spring, when they may be pricked out in a sheltered border, from where they may be lifted and transplanted with a trowel into flowering quarters. Should the open ground seedlings at any time during winter appear to be distressed, it is well to mulch the whole bed with sharp, dry sand, allowing it just about half to bury the seedlings.

A Selection of up-to-date varieties.

Of varieties we have a grand selection, and while some old favourites cannot be dispensed with, there are novelties of surpassing excellence which deserve to figure prominently in our bedding schemes for 1926 as well as on the exhibition stage.

Among the tall growers which are particularly serviceable for the latter purpose and also for grouping in the herbaceous border The King is one of the brightest and best. Orange scarlet with a suffusion of yellow and white tube is its colour description. Yellow King is the best of the yellows in the tall section, and Monarch is a grand crimson. Rose King provides a deep rich rosy pink on spikes a yard high.

The most serviceable of all antirrhinums are the intermediates, which range from 18ins. to 2ft. in height. Appleby Matthews is a very beautiful variety, orange terra-cotta with white tube, a plant of excellent habit and producing a large quantity of fine spikes. Charm is well named, for its rose pink is of a delightfully soft pure shade, and the plant is of superb habit. Empress is extremely good as a rich velvety crimson, and Mrs. R. F. Felton is a scarlet self of first-class quality. For delicately tinted and suffused colours Sybil Eckford is enchanting, and Estelle is one of the apricot salmon class which is to be strongly recommended.

Either Gay Gordon or Grenadier should certainly be grown. I cannot imagine anyone being otherwise than delighted with the striking combination of the intense scarlet and bright yellow, but both are so similar that one will probably suffice for most needs.

Fireflame is a brilliantly coloured variety, with flowers of a fiery orange scarlet. During late summer this antirrhinum is particularly effective.

Many other excellent varieties are available, but catalogues of the specialists so well describe them that there is small need for extending my list. A pleasing fact is that the experts have been engaged in improving the Tom Thumb antirrhinum, and are making it a very useful plant for small beds, narrow borders and for margins of large beds. The fault hitherto has been that the Tom Thumbs were too squat and half buried their flowers among a cushion of foliage. The newest types just raise the flower-stems above the foliage. There is just the danger that the lifting of the flower-spikes may exceed requirements, and on that account it is inadvisable to sow the new Tom Thumbs in autumn, the spring-sown seedlings being less prone to get away from correct habit.

EIGHTEEN BULBS FOR THE ROCK GARDEN.

In case readers have forgotten to order their bulbs for the rock garden, here is a short list of suitable varieties:

CHIONODOXAS, *Glory of the Snow.*—*C. Luciliæ, brilliant blue with white centre; C. sardensis, a little darker in colour than the former and later in flowering.*

CROCUSES.—*C. Sieberi, lavender and orange base; C. Tomasinianus, a pale lavender; C. biflorus, outer segments blue and inner white.*

IRISES.—*I. reticulata, February flowering, violet coloured and sweetly scented; I. orchioides, golden yellow; I. Histrio, bright blue with yellow blotch; I. persica, white suffused pale blue.*

LEUCOJUM.—*L. vernum, the Spring Snowflake.*

MUSCARI.—*M. Heavenly Blue, one of the best bright blues; M. azureum, Cambridge blue, earlier than the former.*

NARCISSI.—*N. cyclamineus, yellow and very early, with reflexed segments; the Angel's Tears, N. triandrus, creamy white; N. minimus, the smallest of all; N. Bulbocodium, the Hoop-petticoat Daffodil.*

TULIPS.—*T. Clusiana, the Lady Tulip, outer petals cherry colour, inside white; T. persica, inside bright yellow, outside golden bronze, very fragrant.*

Climbing Plants for the Porch.

THERE is no doubt that the appearance of almost any porch is improved by the judicious use of climbing plants. In such a situation almost any climber can show its characteristic growth to better advantage than when the plant is stiffly trained against a wall. When selecting the creepers, to use a popular name which has a wide application, it is most important to consider the aspect of the porch. Many climbing plants are failures, or at least only partially a success, when growing in a cold and heavily shaded situation, while others dislike a dry, hot situation. In this connection the following lists will be found helpful. It will be noted that certain shrubs, like Cratægus Pyracantha, which do not actually climb, have been included. Some of these are excellent for training against the walls of porches, where they have a softening effect on hard outlines.

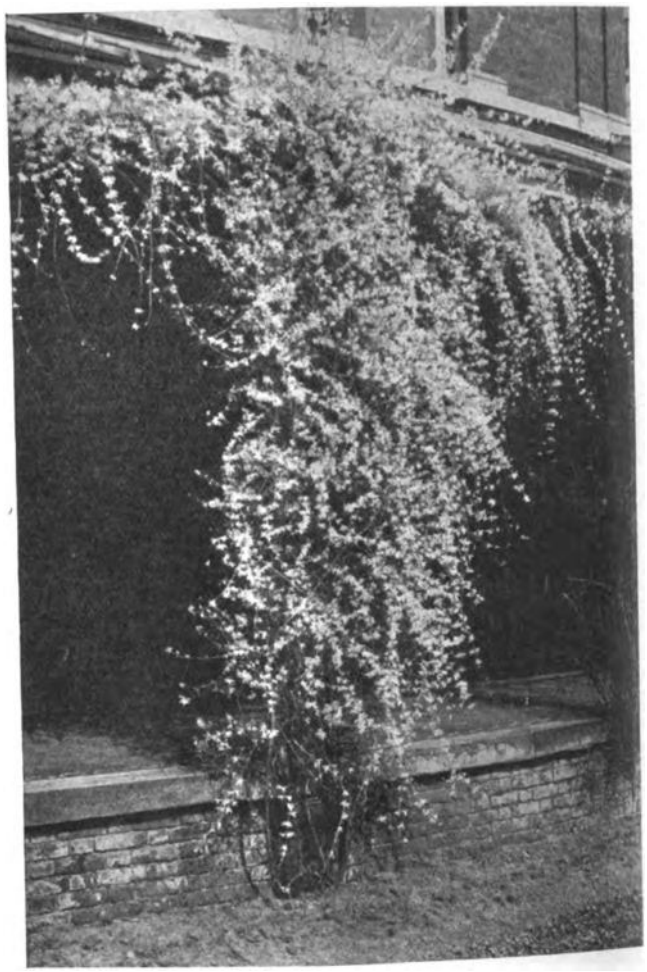
For the north porch.—Here there will be a great deal of shade, and the list of suitable climbers is not very extensive. The common Virginian creeper will succeed well and also any of the strong-growing ivies. Other subjects include Cratægus Pyracantha, Calycanthus occidentalis and Rose Homère.

For the south porch.—Many attractive climbers are available, and it is only possible to give a few. Passiflora cœrulea and its white variety, many kinds of clematis, wistaria, and roses such as Gloire de Dijon, W. A. Richardson and (in mild localities) Maréchal Niel, will all do well. Vitis inconstans, the self-clinging Virginian creeper, is also at its best with a south aspect on account of the glowing autumn colouring of its foliage. Escallonia and ceanothus are useful shrubs for sunny positions.

For the east porch.—Here the lovely Ayrshire and evergreen roses do well. This is an excellent position for Cydonia japonica, Forsythia suspensa and Jasminum nudiflorum.

For the west porch.—Good subjects include Clematis montana and C. Jackmanni. Vitis vinifera purpurea, with its bronzy red leaves, is also very fine. Other subjects include Chimonanthus fragrans var. grandiflora, Garrya elliptica and Jasminum officinale.

When planting creepers prepare the situation carefully, especially if the specimen has to be established where there is no actual border. All climbers, if they are to grow vigorously, must be able to extend their roots freely, and it is as well to open up the ground over rather a wide area.



THERE IS NO EARLY-FLOWERING SHRUB SO GOOD FOR A PORCH AS FORSYTHIA SUSPENSA.

The Border by the Hedge.

IN the suburban garden it is desirable to make the best use of all available space. Often there is a border by the side of a hedge formed of privet, or some other evergreen shrub, which might well be turned to good account with proper treatment. As a rule the plants placed in this position do not give very good results, and the gardener is apt to abandon the bed as hopeless. Sometimes, of course, the hedge casts a definite shade on the situation, and it is well to reduce this by a severe cutting back. The trouble is more often caused by the roots of the hedge shrubs, which drain the soil of moisture and plant foods generally so that it is almost incapable of supporting even the hardiest subjects. The border may be rendered as useful as any other part of the garden if it is treated in the following manner: Open out the ground to the depth of 2ft., or even more, so that the roots of the hedge shrubs are fully exposed. A fork will be the more handy tool at the start, for, owing to the closely matted growth, it is difficult to force a spade into the ground. Then, when the roots are exposed, carry out a severe pruning so that on this side of the hedge they are cut almost back to the stock. Now secure some lengths of sheet iron which are about 2ft. in width. It does not matter how old this may be, and pieces of corrugated roofing that are no longer of service will answer the purpose well. Press the strips of iron closely against the cut ends of the roots so that any further growth in the direction of the border will be out of the question.

Patching the Front Lawn.

THERE are few things more unsightly than those bare places which will, at times, appear on the best-kept lawn. These should be taken in hand while the weather is still fairly warm so that the newly established grass may have a chance to settle in before winter. Loosen the soil well not only on the surface but for some distance down. A common cause of bare patches on a lawn is the existence of a very compact subsoil which prevents a free drainage. Rake the surface evenly and then at once sow grass seed thickly. Unless there is an unusual spell of dry weather no watering will be required.

A plan which the writer has tried with great success is the mending of lawns with grass mats. Here grass seed is thickly sown on sacking. The material is kept moist and allowed to rest on a hard surface which the roots of the grass cannot penetrate. When the grass is growing strongly on the sacking a piece to fit the patch is cut out. This is pressed on to the soil which has been previously well loosened. The material forming the grass mat soon rots away and a permanent green patch, in place of the bare spot, is the result. This plan yields better results than the patching of a lawn with turf. Quite often for a year or more the outlines of the pieces of new turf show in a very distinct way, which spoils the appearance of the lawn as a whole.

On small front lawns a very common cause of bare patches is the overhanging tree branch which drips in wet weather. There is nothing so likely to kill grass as the dropping of water on one place if this continues for hours.

FISONS OF IPSWICH

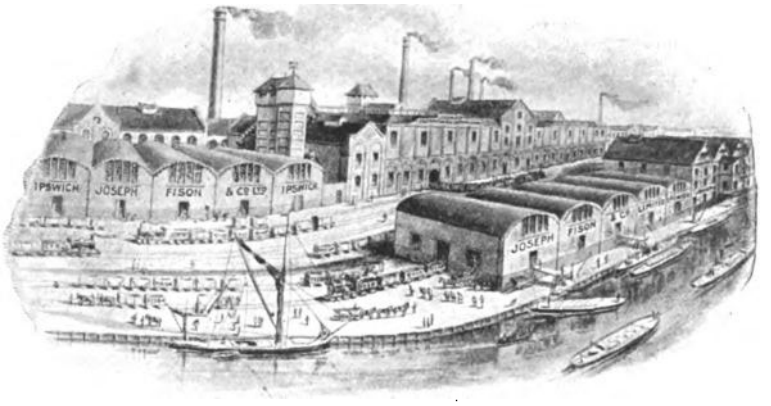
By H.S.

Did Mr. Joseph Fison, as he superintended the dissolving of Coprolites in his tub at Ipswich, seventy-nine years gone by, have a vision of the vast works—the highly technical plant and widespread organisation which stands as his monument to-day.

"FISONS OF IPSWICH": to my mind the very simplicity of this title conveys exactly that sense of dignity, sincerity and vastness which are the outstanding impressions I carried away from my recent visit to the huge works from which half the world or more draws its supplies of chemical fertilizers.

With a friend I had motored down to see for myself this business of converting raw products into life-giving plant foods and I shall endeavour, somewhat sketchily I am afraid, to describe at least some of the things I saw.

But, if you would glimpse the romance which lies hidden in this as in any other great enterprise, you must stand, as I stood, in front of those great mounds of fertilizers—each one different—binned, dated and labelled like some rare vintage wine: Lawn Guano — Fruit Fertilizer—Chrysanthemum — Tomato — Rose — Sweet Pea—Vine and so on. It is then that one realises the fascination that for seventy odd years has lured these men of science into the realm of business — the irresistible fascination of "making things grow."



THE BRAMFORD (SUFFOLK) WORKS OF JOSEPH FISON & CO., LTD., ABUTTING UPON THE RIVER GIPPING, THE L. & N.E. RAILWAY AND THE ROAD TO IPSWICH.

If we were farmers these bins of garden foods would impress us less than those other and still larger bins, housing still greater mounds of agricultural fertilizers, which, in due season, are destined to play such an important part in producing the world's supply of wheat, barley, and other food crops. For, important as the "Home" section of this remarkable business is, it is, if I may use the word, overshadowed by the magnitude of the firm's export trade.

AN OFFICIAL VISIT FROM SOUTH AFRICAN FARMERS.

In connection with this export demand I learnt that in July of last year an important group of South African farmers paid an official visit to Fisons and that one of the most significant tributes they paid had reference to the excellent *condition* in which the fertilizers reached South Africa in spite of the prolonged sea journey. This is, of course, a case of cause and effect. The fertilizers arrived in good condition for the simple reason that they were *despatched* in good condition.

In mentioning the visit of the overseas farmers I am reminded of yet another impression which stands out in connection with my own, and it is one of remarkable *dryness*. How remarkable this dryness was, is explained by the fact that on the day in question everywhere and everybody, with the single exception of the interior of Fisons' Bramford Works and its inmates, appeared, not without cause, to be thoroughly waterlogged. It was as wet a day as I can recollect. Maybe the sun shone somewhere in Merrie England, but, most emphatically, it did not shine on Merrie Ipswich.

I have not the slightest desire to enlarge upon the unpleasant wetness of the weather, but I have special reason for emphasising the ideal conditions of "dryness" under which Fisons' fertilizers are manufactured. This concerns not merely the vast weather-proof buildings which shelter everything, including even the private railway siding, but includes the special process of manufacture, which makes it dead certain that no gardener who takes reasonable storage precautions can ever complain that any Fisons' product has "gone damp" through keeping. I am quite certain that there are many with unfortunate experience of other fertilizers for whom the above statement will have a special and interesting significance.

FISONS' FERTILIZERS STAY DRY.

One of the first essentials of a perfect fertilizer is its fine dry texture and freedom from cloggy lumps, which prevent its fair and even distribution over a given area. This being so, I readily appreciate the insistence of my guide when he so emphasised the fact that when Fisons' fertilizers are dry they stay dry.

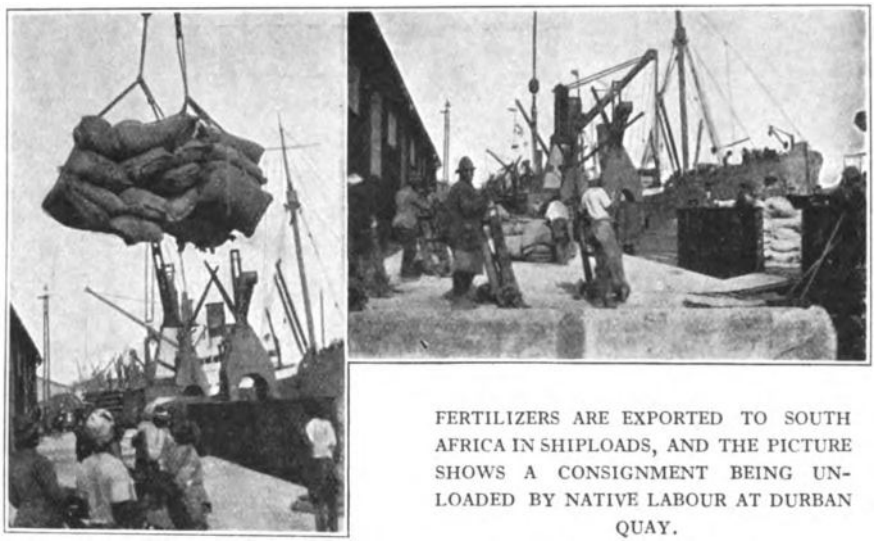
Following this I would like to mention the extraordinary *fineness* which characterises Fisons' fertilizers—it is, indeed, the "fineness of flour." Every gardener knows how important this is. For, since most (it may be all) fertilizers are comprised of three distinct plant foods, of which plants require a definite proportion of each, the whole compound must be so fine and so well mixed that each grain contains its proper proportion of nourishment, namely, nitrogen, potash and phosphates.

This question of fineness leads naturally to yet another important factor—that of mixing. I believe that in the scientific world two cardinal rules are to take nothing for granted until actually accomplished and to leave nothing to chance. I can only say that in their method of mixing, Fisons obey these rules to the very letter.

I have already written that when Fisons' fertilizers are dry they *stay* dry. To this I will add that when they are ground they *are* ground, and when they are mixed they *are* mixed.

Fisons leave nothing to chance! If you could see, as I have seen, how each step forward in the making of a perfect fertilizer calls (according to the Fison standard), for a degree of mechanical perfection and

Digitized by Google



FERTILIZERS ARE EXPORTED TO SOUTH AFRICA IN SHIPLOADS, AND THE PICTURE SHOWS A CONSIGNMENT BEING UNLOADED BY NATIVE LABOUR AT DURBAN QUAY.

scientific scrupulousness that would do credit in a doctor's dispensary, you would realise that I have by no means overstated the case.

1847—JOSEPH FISON, PIONEER.

May I quote from a little history book of the firm's activities since 1847. It says: "In 1847 Mr. Joseph Fison, a pioneer in the discovery of the manufacture of chemical fertilizers, first made Superphosphate by dissolving with Sulphuric Acid, *in a tub at Ipswich* (the italics are mine), coprolites collected from Suffolk farms."

I like the quiet restraint with which the commencement of this immense undertaking is recorded. It so well illustrates the dignified simplicity with which, as I have already mentioned, this business is conducted.

Did Mr. Joseph Fison, as he superintended the dissolving of coprolites in his tub at Ipswich, seventy-nine years gone by, have a vision of the vast works—the highly technical plant and widespread organisation which stands as his monument to-day? I wonder. Did he realise that the pioneer work to which he set his hand and the services he rendered both to horticulture and agriculture would, in the fullness of time, earn for his descendants the signal appointment of Fertilizer Manufacturers to H.M. the King. Fisons not only hold this appointment to-day, but for the past five or six years have sent regular supplies of their fertilizers for use on the Cornish estates of H.R.H. the Prince of Wales.

Breaking away from my narrative for a moment, it is interesting to note—especially in these topsy-turvy days—that there still exist sound old British business houses in which hardly acquired technical knowledge is handed down from father to son as an honourable "Trade Secret," together with the family tradition for honourable and just dealing. Fisons of Ipswich represent this all too uncommon type to a nicety—it is the type in which progress is made certain through the contribution of brains and energy bestowed upon it by *each successive generation*. It is the type in which the master earns the respect of his workmen, and in which the workman earns respect and consideration from his employer.

5,000 TONS OF PHOSPHATE.

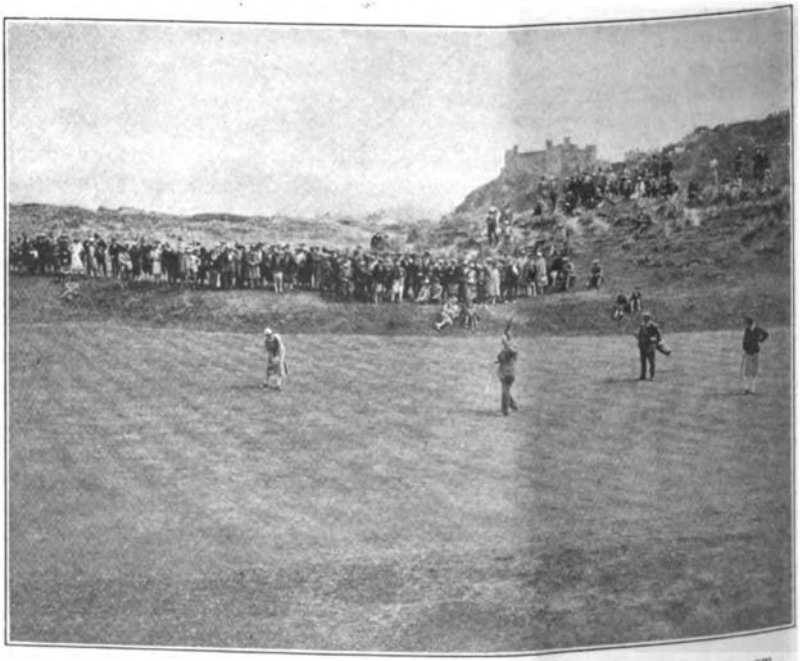
As we came away after our visit my friend turned to me and said, "It is almost incredible, never did I realise there existed in this or any other country so great a business devoted to the manufacture of fertilizers. Did you?" And truthfully I answered, "No." How could I? How could any man whose wildest conception ranged no higher than a warehouse full of neatly stacked sacks, realise what it felt like to be suddenly confronted with about five thousand tons of phosphate towering up and frowning at him like some mountain with four walls around it and a roof on top? Many times have I gazed at the mountains in the distance, never before have I stumbled across one *indoors*.

In the Fison works everything seems to start at the top, and the top of the Fison works is a very long way from the bottom. I state this fact feelingly—from which you may gather that I went up. Having arrived there I was able to witness parts of my phosphate mountain being ground and air screened until its degree of fineness was enough to turn a white miller green with envy.

A WONDERFUL SULPHURIC ACID PLANT.

And now we come to the "Super" part of my narrative. That is to say, I will try to give some idea of how the virgin phosphates, after they have been ground as fine as flour, are converted into the superphosphates of commerce. As most gardeners know, this is achieved with the aid of sulphuric acid. Now, the making of sulphuric acid is a costly and highly specialised business, and the fact that Messrs. Fisons have built and equipped one of the largest sulphuric acid plants in the country solely to supply their own private needs is an amazing tribute to their enterprise and the demands of their business. This plant requires a large building all to itself and its nature is so technical that I beg permission to leave the matter at that.

However there is just one sidelight on this intricate business which, as people



MISS CECIL LEITCH PUTTING ON THE 15TH GREEN OF THE ROYAL ST. DAVID'S GOLF COURSE, HARLECH, IN THE LADIES' INTERNATIONAL CHAMPIONSHIPS, 1926. FISONS' LAWN GUANO WAS APPLIED ON EACH OF THE GREENS IN PREPARATION FOR THE EVENT.

Digitized by Google

often say, is "good enough for *Punch*." It concerns the pyrites ore from which Messrs. Fisons' extract the sulphur for their acid. It appears that this pyrite ore hails from Spain, and much in the same way as a schoolboy will, for a consideration, temporarily part company with his stick of Spanish licorice under bond of speedy and honourable restoration, so the gentlemen of Spain temporarily part company with their beloved pyrite ore on condition that it is returned to them immediately the sulphur has been extracted.

SUPERPHOSPHATES AND THE FISON DEN.

Taking things all together, the making of fertilizers is by no means the dull business I imagined. For instance, let me tell you in my own fashion how the superphosphates come into being. In the floor of one of the top storeys at Bramford Mills there is a little trapdoor leading to a sort of reception chamber where the phosphate is invited to make first acquaintance with the acid. A series of revolving "stirrers" immediately assist the new found friends to indulge in a hearty, if somewhat mechanical handshake.

Then comes a visit which I can only conjecture must be highly exciting for all concerned to the Fison Den. This den (in reality a huge cylinder), is, I believe, Messrs. Fisons own invention and supersedes in effective thoroughness all other methods of mixing. Exactly what transpires within this giant drum I know not, but I can say, that when the moment for release arrives the phosphate and the sulphuric acid have experienced such a glorious mix-up, and have had such a hot time of it together, that no one knows which is which. And so to be on the safe side they henceforth sign the register as superphosphates. By the way, I almost omitted to mention that a vicious looking revolving knife carves great slices off the newly-wedded phosphate and acid the instant it ventures to peep outside the den. These slices are spirited away "down" an elevator where the final drying processes await them.

Of the varying processes which follow this interesting episode—of how the superphosphates join other ingredients and finally lose their identity in one or other of the scientifically compounded fertilizers—I have no space to write. It is a tale of ups and downs—of elevators and "shoots," of forced marching along endless rubber bands—of no peace for fertilizers until they reach that final screen which is a sort of "Customs House," where all foreign matter collected on their travels must be declared and handed over. Only through this narrow way and searching sieve can any Fisons' fertilizer hope to gain the peace and temporary respite of a tightly sewn sack.

Towards the end of my travels I noticed another building, so large that it occurred to me that it must house some important process which seemingly I had not been invited to witness. Forthwith I put out a "feeler," and you may imagine my astonishment when I learned that the building in question was merely a duplicate of the one I had already inspected. Thus, in the peak period and other busy times of the fertilizer season, the output can be doubled without risk of congestion or any confusion.

I would like to say more concerning this highly instructive visit—I would like to mention the firm's splendid canteen—the pride they take in the engine and pumping station—I should, by rights, explain fully how each "brew" of fertilizer is analysed—dated and recorded for all time in the firm's log, but time and printers wait for no man. Have I said sufficient to show you that the confidence you, as gardeners, have in Fisons' fertilizers is the result of hard work, knowledge and a genuine resolve to supply you with the best that science can offer and that alone?

THE SPLENDID EXHIBIT OF HYDRANGEAS STAGED BY MR. H. J. JONES, RYECROFT NURSERIES, LEWISHAM, AT THE CHELSEA SHOW, 1926, WHICH WAS AWARDED THE R.H.S. SILVER CUP, WAS GROWN WITH FISONS' FERTILIZERS.

FISONS' CATALOGUE.

Just one final note concerning Messrs. Fisons' catalogue. Many readers may possess copies, and if they do I am perfectly certain they will agree with me that the word "Catalogue" is rather an inadequate word, with which to describe this book and the information contained between its handsome covers, embossed in gold. For instance, the opening chapter, "Chemical Fertilisers—What They Are and Their Effect Upon Plant Life," contains a veritable mine of information for any amateur gardener who is a little "hazy" concerning just what the various things like phosphate of lime, nitrogen or potash do and, still more important, what they will not do.

Even the actual list of Fisons' Specialities, such as Lawn Guano and Rose Fertilizer, is supplemented with many useful notes and hints telling how to get the best out of them.

The book also gives one of the best cultural tables for sowing vegetable seed and the correct rotation of crops. There is also an excellent page of notes dealing with the pruning of fruit trees and bushes. I made enquiries as to whether this book was intended for customers only, and I was told that I might offer an invitation to any reader of this article to apply for a copy. If you would care to do so, please make your application direct to Joseph Fison and Co., Limited, Ipswich. I do not know if it is possible to obtain also a copy of the firm's little History Book, but if you are interested it is certainly worth asking for.

Time and Printers wait for no man, but I would like to finish this article with a real practical and personal hint to those tennis enthusiasts who are now forsaking the grass court for their winter quarters on the "hard."

This has been a strenuous summer for lawn tennis lawns—plenty of sun, plenty of hard play. Now is the time to feed your lawns—rejuvenate the grass roots—and destroy the clover—moss—grubs and other things which conspire to take advantage of a tired out lawn. Fisons make the things that do these things and, as usual, with this thorough going firm, they are willing to give you their reasons first and leave the decision of purchasing to you. So when you are writing for the Fison Catalogue, ask also *at once* for a clever little book entitled "The Cultivation of Turf."—H.S. [ADVT.

FERTILIZERS FOR THE GARDEN

IT is not true economy to buy expensive seeds and plants and to pay your garden wages if for the sake of a small outlay on Chemical Fertilizers you starve the soil and prevent your garden from producing its maximum of Fruit, Vegetables and Flowers.

FISONS' LAWN GUANO

Constant cutting reduces the store of nutriment in thes oil. To continue resistance against weed seedlings, strong roots must be regularly nourished. Finest swards with strong roots are produced by using FISONS' LAWN GUANO. Use 4oz. to the square yard.; 1cwt. is sufficient for a tennis court. The Guano is used by important Sports Clubs.

Prices	7lb.	14lb.	28lb.	56lb.	1cwt.	
	4/-	**7/-**	**11/-**	**18/-**	**33/-**	Carriage paid.

FISONS' LAWN SAND

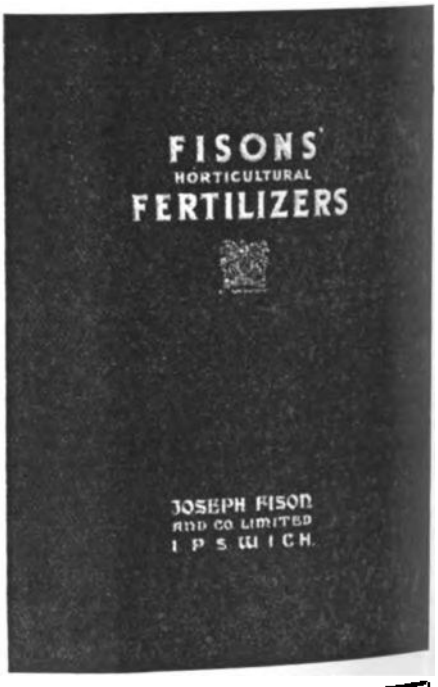
Complete destruction of clover in lawns can be obtained by the use of Fisons' Lawn Sand. The grass is nourished at the same time. It is a recognised weed eradicator. Use 4 oz. to the square yard; 1cwt. is ample for a tennis court. Fisons' Lawn Sand delivered direct from the works in wooden kegs.

Prices	14lb.	28lb.	56lb.	112lb.	
	7/6	**12/6**	**20/-**	**35/-**	Carriage Paid.

FISONS' FRUIT FERTILIZER

Heavy crops are peculiar to healthy trees, and nutriment is drawn rapidly from the soil by these. Prepare for next year's crop now. Complete restoration of the constituents necessary for sound crops is obtained by using Fisons' Fruit Fertilisers. Use 7lb. to the rod in the Autumn. Professional growers secure their crops by using this Fertiliser.

Prices	7lb.	14lb.	28lb.	56lb.	112lb.	
	3/-	**5/-**	**8/-**	**13/6**	**24/-**	Carriage Paid.



A complimentary copy of FISONS' Illustrated Catalogue of Garden Fertilizers will be sent to those interested by return of post on receipt of name and address.

HOW TO MAKE THE BEST USE OF FRAMES

THERE is no doubt that the possession of one or more frames is an enormous advantage to the gardener, especially at this season of the year. Frames of every conceivable size and shape are to be found in gardens, but probably the most convenient pattern is that with two lights. This can be easily moved about and placed on prepared beds of fermenting material for forcing purposes. A three-light frame gives extra accommodation, but this will be more difficult to handle when it is required to change the position. Generally speaking, the depth of frames should not be greater than is sufficient to hold the necessary soil and accommodate the plants so that the latter may be as near to the glass as possible. There will then be no risk of their being unduly drawn.

Wintering Tender Plants in Frames

Many tender plants which it is desired to keep through the winter, such as geraniums, fuchsias, etc., can be safely housed in a cold frame. Should the weather become severe the frame can be covered with matting, dried fern, or anything to keep the frost out. During mild, quiet weather free ventilation should be allowed, as in the confined quarters of a frame the air is likely to get stagnant and damp. This will bring the plants into a very unhealthy state, and the only preventive is plenty of fresh air whenever the conditions are at all favourable.

Making up a Hot-bed.

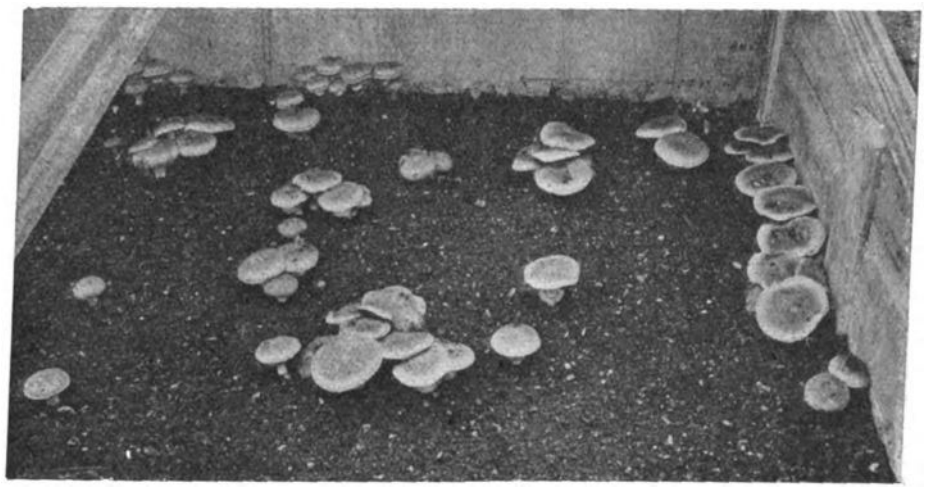
Of course, the value of a frame is very much enhanced if it is used in conjunction with a hot-bed. With artificial heat the grower can produce all kinds of things that are very welcome during the autumn and early winter. In making a hot-bed the length and width of the frame should be marked on the ground. All round this should be indicated a space a foot wider by placing a stick at each of the corners. In this way, when the bed is completed, it will be a foot wider and longer every way than the frame itself. The site for the hot-bed should, if possible, be facing south and must be on a well drained surface so that water will not lodge at the base of the bed and check the heating of the manure. Secure some good fresh stable manure and shake this well out three or four times to remove any sawdust, shavings, etc. Any dry parts should be damped and the heap must be repeatedly turned over for about a week. Then the manure should be laid down in even layers on the space which has been marked with the sticks. At this stage dead leaves and tan may be worked in with the manure. These have not the same intense heating properties as manure, but the warmth lasts longer. Press the mass down well until a height of about 2ft. or a little more has been secured. The frame is then placed in position and the lights are opened to allow the steam to pass away. The hot-bed will rapidly attain to a heat of 130° to 140° F., which is, of course, too high for the well-being of plant life. Two or three days must be allowed for the temperature to subside, after which the manure may be covered with a layer of soil if it is desired to grow anything directly on the bed. Of course, where the plants are in pots or boxes these may be placed straight on to the manure, or, in the case of those to be forced, they are sunk right up to the rims. Naturally, the heat of a hot-bed tends slowly to decline as the weeks pass. Manure banked up round the outside will be found to put fresh life into the heap, and an even more effective way is to work short manure with a fork right into the bed.

Forcing Vegetables and Flowers.

With the hot-bed in full swing there are almost endless possibilities for the enterprising grower. It is easy to grow many of the early vegetables and salads, like carrots, lettuces, radishes, etc. French beans and peas in pots are also worth trying. A few dishes of green peas in December, or even later, will be very welcome and are easy to secure. Sow the seeds in pots in September and keep these out of doors for a month or six weeks. Then remove to the hot-bed, which may previously have been employed at a stronger heat for the culture of salads. Give plenty of fresh air whenever possible and there is no reason why the peas should not set well. French beans are as easy to manage, although here it is as well to have the pots in the hot-bed from the start. In both cases buy varieties of peas and beans that are suitable for forcing. Asparagus is more easily forced in a frame than is commonly supposed. Cover the manure with about 3ins. of gritty soil and then place out the roots rather thickly. Finish with a 4in. layer of a rich light compost and give water at 80° F. to settle things down. Keep the frame well protected during cold weather but ventilate whenever the conditions are mild. Naturally, a frame with a hot-bed is an ideal place for the forcing of the early bulbs. It is quite easy to keep up a continuous display of bloom, though it is essential that all bulbs should be thoroughly well rooted before bringing into the heat. Lilies of the valley may also be brought into early flower. Up to the end of the year it is better to use the retarded "crowns," as these give much more satisfactory results. They are easily brought into full flower and leaf within a month. When forcing bulbs and lilies of the valley, growth will be quicker if the plants are kept in darkness by the placing of mats on the lights. Air from the outside should be admitted cautiously, and not at all if the weather is cold.

Mushrooms in Frames.

A frame which has been fitted with a hot-bed is ideal for the culture of mushrooms. The hot-bed is prepared in the manner already described, but special care should be taken to beat the manure down very firmly. After making the bed nothing should be done in the way of planting until the temperature has subsided to 85° to 90° F. This may be ascertained by plunging a thermometer into the bed. Mushroom "spawn" is sold in the form of cakes or bricks, and, when planting, each of these may be broken into six pieces. These pieces are just pushed into the bed about 6ins. to 9ins. apart. When the bed has been spawned all over, cover with a 2in. layer of soil. Rich loamy soil is best for the purpose, but ordinary garden mould will answer almost as well. It is essential that the soil should be passed through a sieve, or, in the case of loam, chopped very finely. Care should be taken to see that the mushroom bed does not get really dry, although the soil must not be kept in anything like a sodden condition. Cold water should never be used and water must always be given in a tepid state. After about a month, if all is going well, it will be seen, on pushing aside the soil, that extensions of the spawn in the form of white threads are beginning to push their way about the manure. Shortly after this the mushrooms appear in the form of tiny white buds which rapidly increase in size. Generally speaking, mushrooms are at their best when the gills inside have assumed a bright pink colour. When the gills become brown the mushrooms tend to have a much ranker flavour.



FORCED MUSHROOMS ON AN OLD HOT-BED.

General Management of Frames.

For whatever purpose a frame is used, it is a mistake, as is sometimes done, to place it in any odd corner of the garden. Certainly it is an advantage to have the frame where there will be some protection, such as a fence or a hedge, against winds from the north or east. Otherwise the more open the situation the better, so that the plants may have the full benefit of such sunshine as may be experienced. Never have a frame where water from a roof or a tree branch can drip on it. In damp autumn weather it is often rather a difficult matter to keep the interior of a frame in a dry wholesome state. Where the air inside is stuffy, fungoid pests may do a great deal of damage to young plants and, to prevent this, free ventilation is very needful. All frames are happy hunting grounds for slugs, snails and other pests. This is especially the case with hot-beds, where these creatures will often thrive and increase to an amazing extent. As far as possible all soils used in a frame should be sterilised with scalding water or baked in order to destroy the eggs of slugs, etc. This plan also kills the spores of mould and other minute fungi.

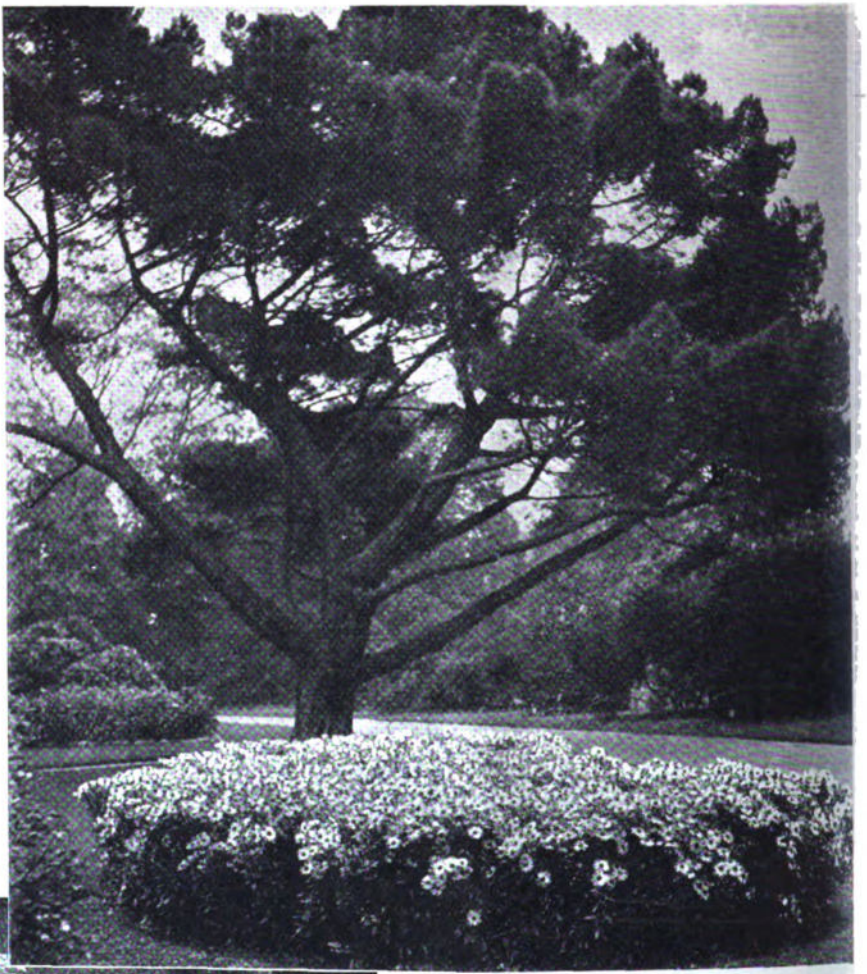
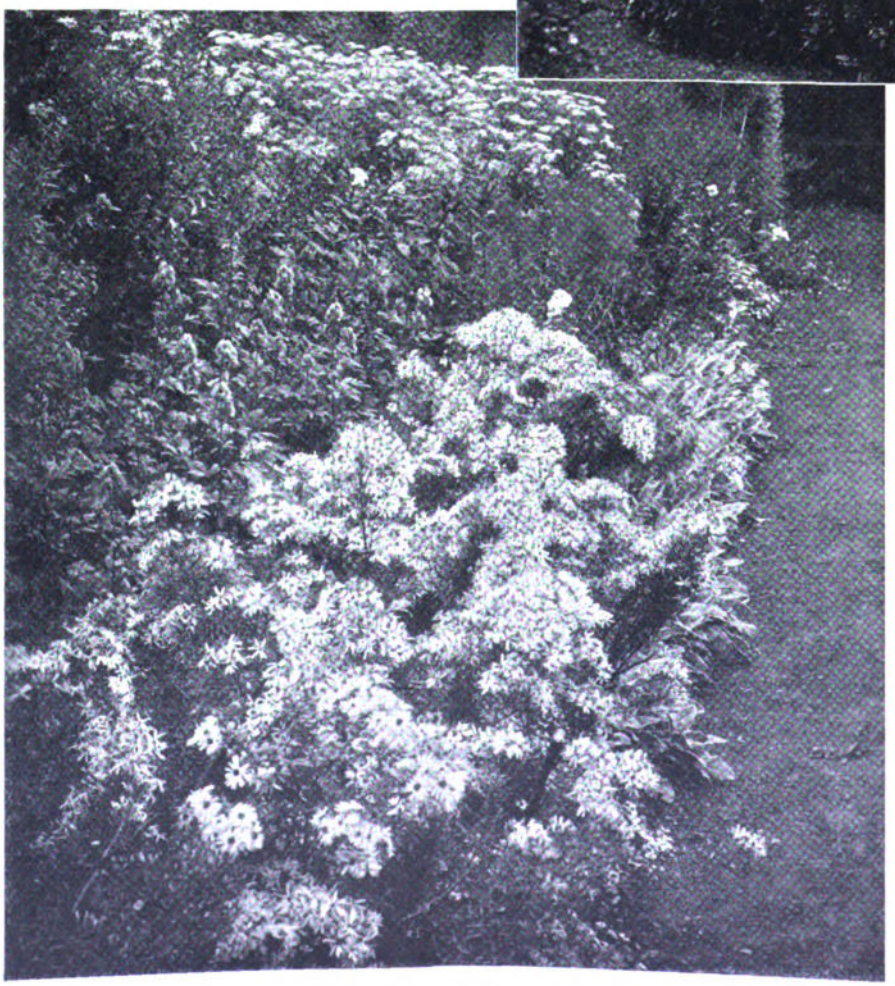
Do You Grow These Michaelmas Daisies?

Now that perennial asters, or Michaelmas daisies, are at their best, readers should see if those that they grow come up to expectations. There are few plants so useful in the late summer and early autumn, whether they are planted for massed effect in a bed or along with other plants in a herbaceous border. They are little trouble to grow; they are now obtainable in a large range of enchanting shades; they bloom profusely over a long period; they are admirable for use as cut flowers for house decoration. No garden, whether large or small, should be without them; for they are among the best plants for the amateur. He knows that with Michaelmas daisies he can succeed whatever the climate or soil may be, for they are among the most accommodating plants that we have, and provide the most vivid colour effects during the autumn months.



ASTER AMELLUS KING GEORGE AS A BEDDING PLANT.



ASTER ACRIS AS A CONSTITUENT OF THE LATE BORDER.

On the opposite page some admirable varieties are illustrated. Three of them—Nancy Ballard, Perry's White and Little Boy Blue—belong to the Novi-Belgii section, one of the largest and one of the best, that is noted for its large-flowered varieties, very floriferous and strong, healthy growers. The fourth, Barr's Pink, belongs to the Novæ-Angliæ, a small section, but containing one or two fine varieties, like the one illustrated. Other sections are the Amellus and the ericoides, the latter with heath-like foliage. These illustrations also show the great variation in type of flowers; some are semi-double, some have wide and comparatively few ray florets, in others the florets are narrow and closely set. Above all, they show the same grace and free-flowering habit. Each individual bloom is not only perfect in itself, but in the mass makes a marvellous effect. At least one of these types should make an unmistakable appeal to the amateur who wishes to add brightness to his garden.

HINTS WORTH REMEMBERING

This is the first instalment of Hints that have been received from our readers in response to our request. There seems little doubt, judging from the numbers that have reached us, that this will prove a most useful feature of THE GARDEN *in future. We hope, therefore, that all our readers will assist to make this page as valuable as possible by sending in their Hints, the result of personal observation and trial, and so help the gardening public in general. Hints which will be specially considered as worthy of a prize will be those that are seasonable as well as interesting and apply particularly to duties that can be carried out in the garden at the present time.*

Half a guinea will be paid each week for the most useful or interesting hint sent in by a reader. Five shillings will be paid for all others published. Each must be sent in on a separate sheet and must not be more than 300 *words in length.*

THE HALF-GUINEA HINT.

Propagation of Double Gypsophila.

Amateurs may strike this plant from cuttings if the right sort of cuttings are taken. This is important. It is practically impossible to root tops of the main shoots, but laterals from them, which are freely produced, take root fairly easily under conditions similar to those given to perpetual carnations, viz., inserted in spring in sandy soil with mild bottom heat.—A. J. C.

Pernettyas Fruiting.

Having bought all my pernettyas when covered with berries, I was much disappointed when year after year I had no more fruit, though numerous flowers. Then came a hint that the plants were monœcious, and a visit last autumn to a doubting market gardener for the purchase of a plant without berries. I planted this near the plants I already had, and this autumn the trees are covered with fruit, with the exception of the last bought, which, though covered with flower in the spring, has not a single berry.—M. C.

Sowing Lawn Seed.

My system of sowing lawn grass seed is to have two lines with a stick on each end 1yd. long. Then I measure a pound of seed in a box and lay a piece of cardboard to fit inside on the top of the seed; I next make a pencil mark on the top of the cardboard so as to know when I have a pound of seed without weighing. I measure 16yds. in length, that is for 1 oz. to the yard, then I sow my seed between the two lines. In this way, if you sow your seed up to each line, it is bound to come up evenly and not patchy as one sometimes sees it. Of course, the ground is prepared in the first place, and after sowing, the seed is lightly raked in and rolled when dry.—W. L.

A Spring Effect in Bed or Border.

Darwin tulip Loveliness with Cheiranthus mutabilis as an undergrowth, deep bordering of pink and blue Myosotis interspersed. Ajuga reptans atropurpurea as an edging and foil to grass.—E. W.

A Preventive for Damping-Off Among Seedlings.

It is just now and during spring when batches of annuals are being raised from seed for next year's garden that the gardener has to suffer much loss in his crops through the dreaded damping-off disease which makes its appearance through over-watering and bad ventilation. One of the most effective remedies I know is to water the seedlings with a dilute solution of potassium permanganate. The best way to judge the strength of the solution is not so much from the actual quantities but from the colour of the solution, which should be of a pale pink to purple tinge. Watering with this solution should be carried out at least twice a week, and the results will easily repay one for the little extra trouble involved. A concentrated solution of the permanganate can be purchased and diluted with water to the desired strength—or, rather, colour. A few drops of it put into the water kept in the greenhouse will be found beneficial in keeping down the scum which invariably collects on the surface of the tank.—R. E.

Floating Bulb Gardens.

A pretty little novelty for the indoor garden is formed in this way. Get one or two large flat corks, or some pieces of virgin cork. Make holes in these in which the bulbs of crocuses, scillas, etc., can be inserted. The bulbs should be arranged so that the part from which the roots come is well to the under side of the cork. Fill an ornamental bowl with water and then float the corks on the surface. Keep the bowl in rather a shaded place for a time and, if a lump of charcoal has not been placed in the water, change every ten days. When the bulbs are sending down their roots freely into the water bring the bowl into a warm sunny room. Then scatter grass seed thickly on the tops of the corks or cover with bright green moss. —F. C. W.

Preserving Marrows.

Vegetable marrows may be satisfactorily preserved for winter use in the following manner: Cut the marrows at the end of the season with as much stalk as possible. Now cover the cut part with melted sealing wax, taking care to close it up altogether. In this way the air is entirely excluded and there is no risk of the marrow starting to shrivel, as often happens when the cut part is left exposed.—R. E. L.

WHAT OUR READERS SAY

LILIES FOR THE GARDEN.

SIR,—In the last paragraph of his letter, "Ignoramus" raises the whole point. It is next to impossible to obtain the information he asks for in potted form. On the other hand, handbooks giving all that he requires are readily obtainable at small cost. "The Book of the Lily" is one.

General principles are comparatively easy, but each lily requires its own special treatment to ensure a modicum of success.

Here are a few notes, etc., that may help him. With the exception of L. candidum, Henryi, regale, the tiger lilies, the Turk's cap, L. Philippinense formosanum, and one or two others, the great majority of lilies are definite haters of lime and chalk.

Cultivation.—All lilies appear to require perfect drainage, even the swamp lilies like their bulbs to be dry, though their roots are in the wet.

Compost.—I have found that broken brick or tile, and charcoal, freely added to a sharp mixture, two thirds leaf-mould and sand, one third good loam, gives satisfactory results. In planting a full sized bulb I invariably give it a bed and a thick waistcoat of silver sand, and plant the bulb, with the exception of candidum, which should be at the surface level, at a depth equivalent to three times the diameter of the bulb, that is to say, a 3in. bulb 9ins. deep, a 4in. at a depth of 12ins., and so on.

As a broad general rule, all lily bulbs detest being moved and even as seedlings prefer to be raised in their ultimate positions, *when* this is possible.

Lily seeds should be sown in pans or boxes, in a sharp compost, when ripe; further, it helps growth if, till germination has occurred they are kept close. After this they should be hardened off in the cold greenhouse or frame. When they have their first rough leaves, if they are to be transplanted, this should be done very carefully. Green fly is the great enemy of young seedlings and should be ruthlessly kept under. The vast majority of lilies, except regale, dislike a full sun and all are happier if their roots are in shade. Lastly, slugs are very fond of lily bulbs. —"IGNOTUS."

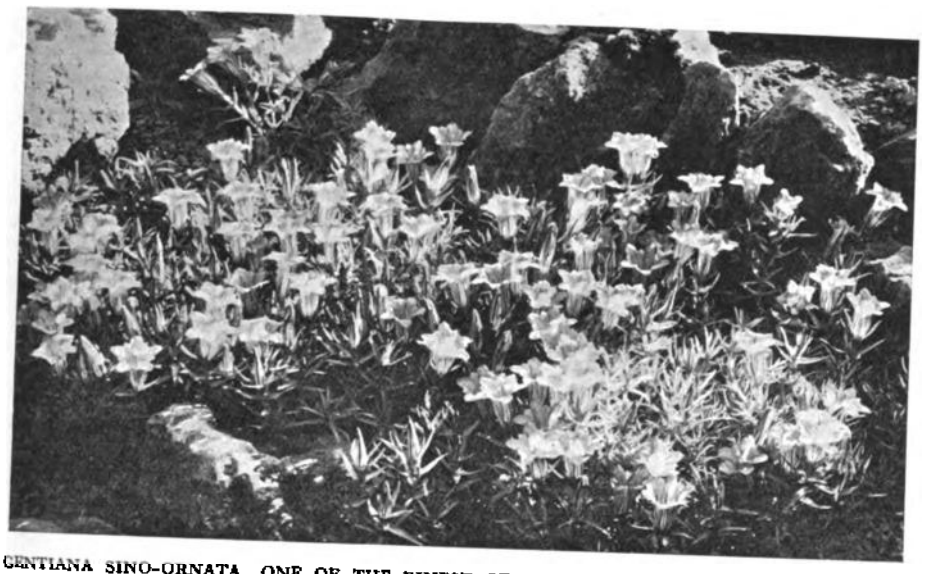
A FINE PATCH OF GENTIANA VERNA IN A READER'S GARDEN.

GENTIANS IN AN AMATEUR'S GARDEN.

SIR,—The late R. Farrer, in his small book on "Rock Gardening," refers to certain gentians as "mimps." In spite of this, or, maybe, because of it, I have given much time and thought to some of the more difficult and rarer species of the genus, so that to me and, I expect, to many more of your readers, the article by Mr. A. Harley on "A Selection of Gentians," in your issues of July 31st and August 7th, has been studied with great interest.

I venture to enclose one or two illustrations of gentians growing in my garden. G. acaulis grows quite freely in my soil. When I first started with a few plants, I prepared special beds and made a great fuss by mixing mortar

Digitized by Google



GENTIANA SINO-ORNATA, ONE OF THE FINEST OF AUTUMN-FLOWERING ROCK PLANTS.

rubble with the soil, but now I find this quite unnecessary. The clumps increase very rapidly, and to get an abundance of bloom it seems necessary to divide the clumps every three or four years. Seedlings I raised last year are now nice little plants and are throwing up fat flowering buds.

The photograph of G. sino-ornata was taken last October and was, indeed, a very fascinating patch. The bed was made, early in the year, of peat, sand and leaf-soil. To give the roots the cool moisture they love, I let into the beds land-pipes, in some instances under the ground and watered from a feed-pipe hidden behind a rock; and in others the pipe inserted upright. During the very hot and dry weather these are filled up with water two or three times a week; by doing this I find that, although the surface is bone dry, the soil a few inches under is quite cool and moist. However, whether this trouble is necessary or not, it has appeared to give results of great satisfaction.

I was much interested in Mr. Harley's idea of incorporating manure with the soil, and shall certainly try his method next year. I quite agree that to retain the moisture in the soil is the chief secret to success.

I am not going to say much about G. Farreri, only that when grown well it is one of the most beautiful of the genus.

It is not very often one hears anything of G. Purdomi: perhaps it is not too well known yet, or only a few have managed to be lucky enough to flower it or to see it flower to perfection. I saw a plant in full bloom at the end of July, and it was a sight never to be forgotten.

The photograph of G. verna was taken in the spring of this year. The bed, which is at the base of a dry wall facing due south, was made four or five years ago. The ground was dug out to a depth of 2½ft., rough stone placed at the bottom and filled in with a good mixture of loam, leaf-soil, sand, fine moss-peat and mortar rubble.

G. bavarica is so very often taken for G. verna—a mistake one can quite understand. In the first place, the flowers of G. bavarica are of a velvety intense blue, unlike G. verna in any form, on taller stems of 3ins. or more; in the second, the foliage is of a yellow-green and much smaller. Many people find it difficult to thrive, but if grown in a thoroughly wetted sandy soil it should do well. Two little pieces, planted in my garden eighteen months ago, have increased into fine clumps and are now flowering for the third time in twelve months. There is one very important factor to bear in mind, and that is strain. There is no doubt that certain strains of gentian, such as G. acaulis, G. Farreri and, more particularly, G. sino-ornata, are more robust and free flowering than others.—A. G. W., *Surrey*.

THE DECORATIVE AGAPANTHUS.

SIR,—Increasing use is being made of the blue African lily as a means of outdoor decoration during the summer months. Where one solitary house, out of many hundreds, was wont to take advantage of this beautiful flower to make the approach to the house more pleasant and colourful, one sees several house frontages nowadays graced by the presence of the agapanthus, with its handsome drooping foliage and tall stems bearing huge clusters of flowers that are of a glorious blue shade.

It is really strange why this subject is no in greater demand for the purpose. Anyone possessing a greenhouse can introduce the flower into his garden arrangements every year with great profit, seeing that the plant remains in flower from some time in June—perhaps in July—up to the middle or end of September; at any rate, a three month's display can be depended upon, which may be extended by allowing the pots to remain out of doors until it becomes dangerous to do so, for the foliage itself adds ornament to the garden even after the flowers disappear.

Here we have a valuable plant that all may grow who can provide the necessary glass shelter during adverse weather. Precautions are essential especially against frost and keen winds; and even in summer, should strong winds prevail, it is well to place the plants in a sheltered position or move them to the greenhouse for the time.

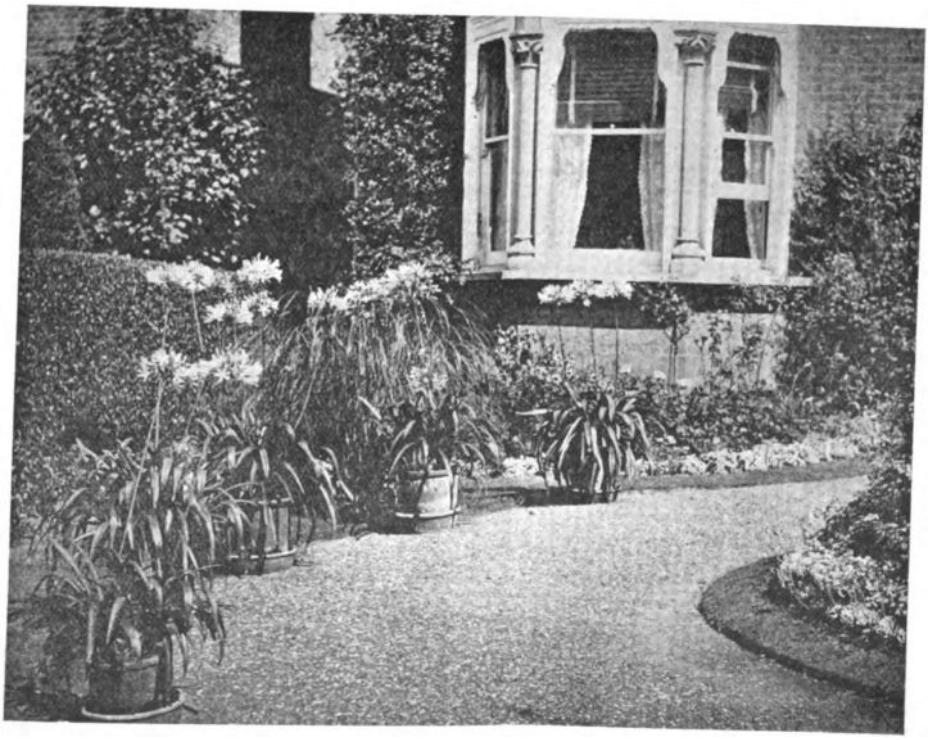
The plant does not demand great things in the way of soil or special culture. Once the bulb is planted, in pot or tub, and growth commences, ordinary attention and care that can be given by the amateur will keep the plant in good condition. It will need re-potting, perhaps every third season, and a yearly top-dressing is an advantage.

There are three agapanthuses of half-hardy nature. Two—the blue and white A. umbellatus—are the most commonly grown, and are easily acquired of any nurseryman, but the other—A. giganteus—is a very rare plant of much larger dimensions and growing up to 7ft. in height, which is suited for large conservatory decoration. In addition to these, there exists a *hardy* species—A. mooreanus—of dwarfer stature, but with dark blue flowers.—H. A. DAY.

BUDDLEIA FORRESTII.

SIR,—In your editorial of September 11th, I notice that you have dealt rather severely with Buddleia Forrestii. May I suggest that its failure with you may be a matter of position or climate that many of your readers escape? Having seen the plant at Pylewell Park, Lymington, for several years in succession, my regard for it has steadily grown. Planted in a light, dry soil at the foot of a low wall facing south it flowers very freely, and the harmony of those lavender-blue spikes with the white tomentum on stem and leaves is most beautiful.

Here I find the shrub a little tender, and frost last winter cut it to the ground, while B. Fallowiana, growing beside it, escaped with a shaking. It is worth noting that, although my plant was propagated from the Pylewell specimen, it never achieves the hoary aspect of the parent, which I believe is due to excessive waterings.—H. BLANCHARD, *Parkstone*.



AGAPANTHUSA ARE USEFUL FOR SUMMER DECORATION AT THE FRONT OF THE HOUSE.

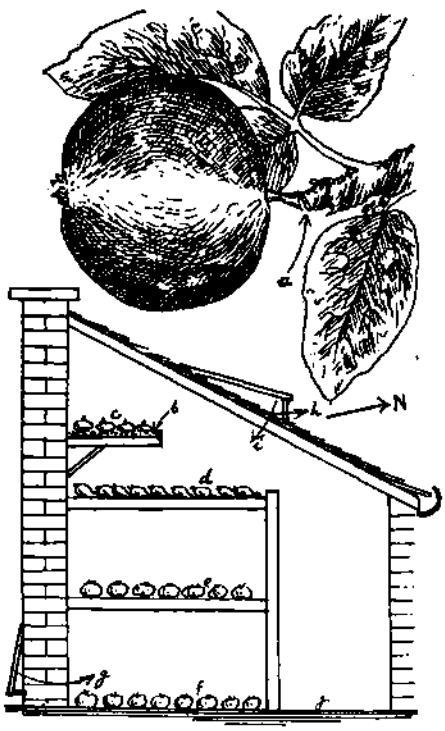
THE FRUIT AND KITCHEN GARDEN

Gathering and Storing Hardy Fruits.

IN the southern counties hardy fruits ripen earlier, naturally, than in the northern. In the northern, midland and southern counties all fruits should be gathered as they mature, even if the work is prolonged, as it is essential to the successful storing and keeping that the specimens of every variety be fully ripe when gathered. For the benefit of the inexperienced I would draw attention to the specimen shown in the sketch. When it is raised gently to a horizontal position and parts readily from the stem, as shown at *a*, it is fit to gather. All fruits should be carefully placed in single layers on dry, soft hay or paper in the basket, and so conveyed to the fruit store. Careful grading is beneficial. How a cool, dry old shed facing north may be converted into a fruit store is shown in the sketch.



Lath shelves should be built. Sand is placed on the top one for medlars to be placed eyes downwards, *c*. Pears at *d* and apples at *e* and *f*, the longest keeping ones at the bottom. Form ventilators at *g* and *h*, with the lid, *i*, to close down as required. The path is shown at *j*. The structure should be kept darkened.

The Care of Raspberry Plants.

FEW kinds of plants become a thicket sooner than raspberry canes when once they are neglected. There is all the difference between a well cared for plantation and one left to run wild. We may see examples in our journeyings through various districts. Close attention to details of management means fine remunerative crops; neglect, failure. Directly the crops are cleared, cut out all old canes close to the soil; then follow up this work by removing quite small, unripe or sappy sucker shoots, pulling them up forcibly to prevent an undue growth of weakly shoots next year. At the same time pull up and burn all large weeds found, lightly hoeing the seedlings. All that are not wanted should now be cleared away. The extra strong young canes that may cause overcrowding should also be removed. A suitable distance between the retained canes being about 6ins. Instead of tying up the retained canes now, allow them to spread out so that air and sunshine may help them to mature thoroughly. At this stage it is advisable to make sure that all supports are sound and secure, also to prepare a winter surface mulch.

Blanching Celery.

OF course, it is necessary to attend to the blanching of celery at an early stage of the plants' growth where they are required for early use; but the late, or main, crops do not require very early attention in this respect. Inexperienced cultivators are always anxious to finish the earthing-up work, as they think it will hasten the growth of the plants. But it is a mistaken idea, as the heaped-up earth actually prevents water reaching the roots in great quantity. The celery being a water-loving plant, requires much moisture at the roots, especially throughout the growing stage. At the present time all side shoots and any outside split leaves should be carefully removed and the plants lightly tied with soft raffia. Then thoroughly soak the roots and soil with diluted liquid manure and forthwith place soil to the stalks to blanch them, taking care to press the soil firmly to them, but keeping it out of the hearts. Where slugs are troublesome place a mixture of coarse sand and sifted ashes next to the stalks. It will increase the whiteness of the stalks as well as prevent slugs eating them.

Late Summer and the Winter Tomato Crops.

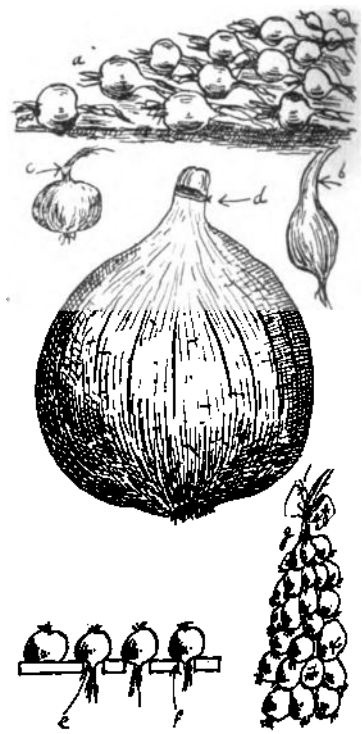
THE tomato being a sun-loving plant, can be very successfully grown during the warm summer and early autumn months with ordinary care as to management. Extra care is, however, needed when the autumn turns out to be cold and dull. There are thousands of amateur cultivators who at this time possess plants bearing more fruits than at any earlier date. Full exposure to air and sunshine is most essential. This exposure is obtained only by cutting off all old main leaves. As the latter have done their duty, their removal now will help matters. The next stage is to pull up the plants with their ripening fruits and suspend them in a cold glass structure or open shed to finish. Finally, the latest specimens may be gathered, placed in cupboards or boxes and covered with flannel to ripen and colour. The young plants for bearing the winter crop should at this date be potted into their fruiting pots and be placed in a house with a summer temperature, and be brought on steadily and sturdily. Winter Beauty is a suitable variety to grow. Use good loam and pot firmly.

Cauliflowers for Next Year.

THE early cabbages may be very successfully grown in the open air throughout the winter months. The earliest cauliflowers may also succeed if the winter be an open one, but we cannot tell what kind of weather will come, so that it is unwise to run any undue risks in this respect. Much must, also, depend upon the locality, the nature of the soil and the situation, high or low. In a light or sandy soil risks are less; in a heavy and naturally wet soil risks must not be taken. The young plants should be protected until quite mid-March. But I wish readers to understand thoroughly that I do not advise any undue protection or coddling. The shallow, cold frame is an ideal place for the young plants, but only when the weather is becoming severe should the glass lights be placed on, and only in times of actual frost should the lights be closed entirely. Any rough temporary frame will answer made with plain boards and a framework to bear up mats as occasion requires. The border soil should be good, but made very firm, then the wintered plants will be nice sturdy specimens to plant out next April.

Gathering and Storing Onions.

ONION bulbs ripen and are ready for storing from mid-August to mid-September, according to the season, the variety and the culture. In light soils they mature earlier than in heavy ones. The



bulk of the onions are harvested about mid-September. Cultivators are very proud of growing fine specimens. Large ones require more care than small ones, but all, if they are to keep sound throughout the winter, must be very carefully harvested. Just a word of warning: Do not allow the bulbs to be exposed to rains after they are pulled up. A few days' drying on the ground as shown at *a*, with the roots towards the south, will help matters wonderfully if the weather is dry. Thick-necked bulbs, *b*, should be stored separately to be used first. Smaller, well ripened ones, *c*, are the longest-keeping. Exhibition specimens should be tied as shown at *d*, only after every part is dried. Big bulbs keep well with the tops downward through the lath shelves, as shown at *e* and *f*. In this way the final drying off may be done. Medium-sized "ropes," *g*, suspended from the roof of a dry shed generally store well, too.—GEORGE GARNER.

OUR SERVICE BUREAU

Though so many subjects are dealt with in each issue of THE GARDEN, *it must constantly happen that readers seek information which is not immediately available. In such circumstances they should make use of our Service Department. Through its medium each reader's own particular enquiry can be dealt with. No matter what the question is, there is always information available from a staff of expert contributors and consultants; and there is no charge for this. It is one of the additional means of service which* THE GARDEN *is glad to render to its readers.*

Also, there is the further convenience which the Service Department affords of supplying readers with data about anything that is advertised in the pages of the paper. Thus, on receipt of an enquiry, particulars will be sent of, say, half a dozen things about which the reader seeks information. The only stipulation is that a stamped addressed envelope and the coupon, that will always be found in each issue, shall be sent with the enquiry.

All communications should be addressed to the Service Department, THE GARDEN, *20, Tavistock Street, Covent Garden, London, W.C.2.*

We have selected the following enquiries, with their answers, as being of more general interest, and therefore worthy of publication.

Diseased Violas.

I should be so much obliged if you could tell me what you think causes my violas to die. Dozens and dozens in the garden have done so; there is evidently some creature, but we cannot find it. If you could tell me what it is and what to put in the ground to avoid the loss, I should be so much obliged. It seems to be destroyed just at the collar.—(Mrs.) PETER JONES.

Your viola plants are suffering from a fungoid disease known as black rot, or black stem rot. We advise you to grow the plants in a fresh border next year and, meantime, during the early winter time, dig into the surface portion fresh lime, at the rate of 8 oz. per square yard. Do not use any leaf-soil.

Alpines for a Small Rock Garden.

I would be indebted to you if you could furnish me with a list of alpine plants with which to lay out a small rock garden in the Clyde district, with a southern, sunny exposure. There is ample moisture in the ground, even in dry weather.

Plants to be mainly of the mossy or cushion variety, and not more than 6ins. in height. I would like to have a display of bright colour through the year, if possible.—G. FORSYTH.

The following would suit your purpose very well, and you can add to them at will: Erythræa diffusa, Gentiana verna, G. ornata, G. acaulis, G. sino-ornata, Verbena chamædryfolia, Lithospermum Heavenly Blue, Campanula pusilla Miss Willmott, Hypericum fragile, Polygonum vaccinifolium, Genista tinctoria plena, Cotyledon simplifolia, Sedum pallida roseum, Hypericum reptans and Thymus citriodorus aureus.

A Blue Garden.

I have a suburban garden on clay soil, and it is my ambition to have it at its best on June 21st or thereabouts each year. I want it to be a "blue" garden.

Could you help me with a list of suitable hardy plants, especially flowering shrubs and climbers?—C. G. CHAPPELL.

The following kinds and varieties would be suitable for your purpose: Delphiniums, eryngiums, Aster amethystinus, lupins, aconites, echinops, campanula, Centaurea montana, Aquilegia cœrulea. Scabiosa caucasica, Gentiana bavarica and G. cruciata, violas, Clematis lanuginosa, wistarias (W. Consequana is a lovely blue), Ceanothus dentatus, C. floribundus, C. divaricatus, Veronica exaltata, V. latifolia and Buddleia insignis, B. intermedia and B. purpurea. Blue anchusas would make a fine display, especially the Dropmore variety.

A Disease of Pears.

Enclosed please find two pears from one of my trees, and also half of one showing a black inside. Can you give me any information about this? The pear, we think, is a Marie Louise, and we have given it potash, kainit and vine manure. Last year we had no crop. This year there is a good setting, but they will be useless if this disease cannot be stopped.—D. A. TYRIE.

The pears sent for examination are attacked by the pear midge pest. The midges lay eggs in the blossoms, and from these eggs grubs hatch out and immediately burrow into the tiny fruits, spoiling them and causing them to fall when but half grown, or earlier. This is a very serious pest, and not the easiest to get rid of. The only real remedy seems to be to run poultry under the trees in June and July, and in April, so that the fowls eat up the grubs as they leave the damaged fruit to pass to the soil to attack the blooms in spring. This method, however, is not always practicable. Alternatively, you must gather up and burn all pears that drop; pick off those abnormally developed, blackened or showing signs of attack, and dress the soil now with naphthalene at the rate of 3 oz. or 4 oz. to the square yard, pricking it lightly into the top soil with a fork. The naphthalene will kill many grubs in hiding in the soil, but is not nearly so effective a measure as that of running fowls under the trees. If the latter method is practised for two or three summers running, a cure may be expected. Spraying is of no use whatsoever.

Backgrounds for Herbaceous Borders.

I am proposing to make a herbaceous border in the autumn, and the question at present taxing me is the provision of a suitable background. The position is abutting on the kitchen garden, it is windswept and the climate is a cold one. I wish to avoid a greedy hedge, if possible, and I have considered a stout oak trellis with hardy climbing shrubs and roses as a possible solution. Could you give me your opinion and also suggest some names of suitable shrubs for trelliswork? At the same time any alternative suggestion would be very much appreciated.—F. N. H. MAIDMENT.

Cupressus macrocarpa planted 4ft. apart and about 5ft. back from the proposed herbaceous border would make the most satisfactory screen. It is not a big robber of border plants, such, for instance, as privet. It will bear any amount of exposure, may be cut to any size or form if trimmed in June and September. Roses would not be very satisfactory, but the close-growing, golden-leaved honeysuckle would be the next best to the cupressus.

Culture of Vallota purpurea.

I shall be glad to have information about the culture of Vallota purpurea bulbs in a small greenhouse. I have now a few pots of the bulbs and the foliage is not very healthy and rather yellow. Should the pots now be kept watered or should it be allowed to die down, as with some amaryllis bulbs? The gardener speaks of it as resting. Is that right?—(Mrs.) H. J. ELWES.

Vallota purpurea requires a firm, loamy soil in which to grow, ample water supplies during the summer months, and a moderate amount during the winter. Complete drying-off may kill the plant. The latter flowers best when fairly pot-bound, so that feeding judiciously every week after the flower-stem shows will be beneficial.

Perennials for Peaty Soils.

Could you name a few genera of perennials likely to succeed in a Cornish garden on the moors? It lies 800ft. above sea level, but in a sheltered hollow, and the soil is practically pure peat.—EDWARD S. RASHLEIGH.

The following list contains plants that will succeed, under ordinarily good treatment, in the garden to which you refer: Achillea The Pearl, Alstrœmeria aurea, Anemone japonica and A. japonica alba, Armeria cephalotes rubra, Campanula carpatica, C. Van Houttei, Centaurea montana rubra, Chrysanthemum Mrs. Lothian Bell, Coreopsis grandiflora, delphiniums in variety, erigeron, Gaillardia grandiflora, Gypsophila paniculata, Helenium superbum, Iris germanica in variety, Lychnis chalcedonica, malvas in variety, phlox in variety, Rudbeckia Newmanii, Michaelmas daisies in variety, Scabiosa caucasica, Solidago canadense and Statice latifolia.

Shrubs Under Trees.

I will feel greatly obliged if you will give me a list of shrubs, both flowering and non-flowering, evergreens and otherwise, for planting under trees.—F. F.

Flowering shrubs under trees are not particularly common. Probably the best are Prunus Laurocerasus, the rose of Sharon (Hypericum calycinum), Gaultheria Shallon and G. procumbens, and, of course, Rhododendrons ponticum and Cunningham's White. Among the non-flowering the most important are the various forms of aucuba, the common mahonia, our native butcher's broom (Ruscus aculeatus) and the rather more common R. Hypoglossum, Sarcococca ruscifolia, also the Alleghany spurge (Pachysandra procumbens). Of course, in addition to these, the privets and the snowberries do well under trees.

How to Make Lavender Perfume.

I have such a large quantity of lavender this year that I am anxious to make good use of it and shall be glad of any suggestions.—(Mrs.) G. I. CLARK.

A very pleasant perfume is made from lavender flowers (after being thoroughly dried) if the following directions are carefully carried out: Procure a wide jar, fairly deep, and cut rounds of cotton wool, each of which should be soaked with best almond oil. Put a thick layer of dried lavender in the jar, then a round of oiled wool, and so on, until the requisite amount is used, letting the top layer be wool. Leave for a week or ten days, then press as much oil as possible out, and pour into tiny bottles with well fitting corks. Just a drop of the lavender oil on the corner of a handkerchief is most pleasant and refreshing.

GARDEN PESTS
AND HOW TO DEAL WITH THEM

The Narcissus Fly.

The perfect insect bears a resemblance to a honey bee in its hairiness and form, but the end of the body is blunt. Its colour is usually yellowish-brown, but there is considerable variation. The grub is, in form, like a rolling-pin, greyish yellow in colour, with a row of backward-directed bristles round each ring of the body. The damage caused by the larva of the narcissus fly consists in the fact that it eats out the centre of the bulbs. When full-fed the grub crawls out and changes into an oval brown pupa in the soil near the top of the bulb. It is stated that, besides the mechanical injury to the bulb caused by the gnawing, the larvæ excrete an acid which induces decay of the tissues round the burrows, so that the original wound is very much extended.

When planting any narcissus bulbs these should be examined to see if any signs of the grub of the narcissus fly exist. In the early autumn the larvæ, which have developed from eggs laid by the perfect insect, will not have penetrated very far into the bulb. It is recommended that such bulbs should be soaked in water for about a week; this will not harm the bulbs, but it will surely kill the grubs. Watch should be kept for sickly plants, and these should be removed and destroyed, for it is quite likely that they have been attacked by the narcissus fly. It may be mentioned that newly purchased bulbs obtained from a firm of high standing are not likely to be infected with the larvæ of the narcissus fly, as great care is taken to send out only clean stock. When narcissi are actually growing, attack by the narcissus fly is minimised by dusting the plants, when damp with dew, with soot, or spraying with a solution of a wineglass of petroleum, 2 oz. of quassia chips, 2 oz. of soft soap and a gallon of water.

Earwigs.

Many gardeners seem to think that the depredations of the earwigs begin and end with the dahlias, but this is far from being the case. These insects attack flowers of all kinds, and will often do a lot of damage to ripe fruit. The young flower heads of chrysanthemums, dahlias and carnations are specially liable to be assaulted, however, and growers of these should be on the look-out for earwigs in the late summer and autumn. Earwigs will often turn up in large numbers in a garden which has been free from the pest, and this is due to certain curious migratory habits of the insect which are not completely understood. The fact that earwigs work at night makes them very difficult to deal with by the use of any of the ordinary insecticides. During the daylight hours the earwigs retire to cracks in walls, tree trunks or, in fact, any hiding place. The only effective way of dealing with the earwig pest is to set traps. These are of numerous kinds, but for practical purposes the following are the best. Cut broad bean stalks, or the hollow stems of the sunflower and the Jerusalem artichoke, into pieces about 9ins. long and suspend these from the middle among the branches of fruit trees or infested plants. The old idea of filling flower pots with moss and placing these, inverted, at the tops of stakes is good. If it is thought that the pots are unsightly, just as good results are secured by resting the pots on the sides at the base of the plants. Note that any traps should present a fairly dry interior, for earwigs will avoid damp places. Whatever traps are employed, they should be examined often during the day and the captured earwigs shaken out and destroyed.

Leather-jackets.

At this time of the year the perfect insect of one of the worst garden pests is much in evidence. Everyone has noticed those curious two-winged flies commonly known as daddy-long-legs or crane flies, which blunder about in such an aimless way that they might seem to be incapable of any harm. Yet it is a safe rule to destroy all the daddy long-legs to be found, and so help to keep a highly injurious insect in check. The commonest species, known to science as Tipula oleracea, is but one representative of a considerable group, all of which exhibit much the same habits. It is these ungainly flies that are responsible for the leather-jackets which cause such an infinite amount of harm to the roots of plants. The grubs, which are, of course, the larval stage of tipula, live in the soil a little way below the surface and, when present in large numbers, they will devour a large part of the roots of almost any crop. Some are particularly harmful to lawns, others seem to devote most attention to cabbages, but all are capable of a great amount of damage if unchecked. Leather-jackets are clumsy creatures which move about slowly, but they are protected by a very tough skin which makes them difficult to injure. In colour the grubs are a dirty grey, and they are usually about an inch in length.

Preventive measures against leather-jackets may be taken in the autumn, when the female flies are busy laying their eggs. Cleared land may be treated with gas lime or even common salt. This will not only discourage egg-laying, but it will also help to destroy any grubs that may be lurking in the soil. Watering the ground with a hot solution of soft soap is also useful. This will make the larvæ pop up to the surface, where they may be captured and destroyed. In badly infested soil large numbers of the pest may be captured by traps formed of hollowed-out portions of potato, carrot or parsnip half buried in the ground. In the case of lawns, heavy and repeated rollings will often prove beneficial in killing the leather-jackets, which, as has been stated, are usually fairly near the surface. It should be noted that this pest is most troublesome in heavy ill-drained soil. Good cultivation will go a long way to keeping leather-jackets under.—L. B.

AUTUMN CARE OF FRUIT TREES

QUITE apart from harvesting ripe fruit there is need for careful and timely attention to the trees which have this season been more than usually loaded with an extensive variety of insect pests and fungoid diseases.

It cannot be too forcibly urged that there will be a repetition on an even larger scale of the onslaughts by these enemies of the garden and orchard if matters are just allowed to run their course, and the adopted policy is to leave everything to chance, hoping that a sharp winter may kill off the pests. There is a tendency to assume that because this season's crops are now mature and ready for storing there is no further chance of pests doing serious harm; but in horticulture one season always overlaps another, and in the case of insect pests it is during the next few weeks the majority of moths are flitting about seeking suitable depositories for the eggs which are to produce next year's hordes of grubs and caterpillars. Fungoid diseases, too, are ripening their pustules or fruit which contain the spores by which propagation is to be carried on.

Grease-Banding.

An operation which must be carried out now.

The most urgent of tasks at the moment is to get all fruit trees grease-banded, for this is one of the surest methods of reducing the forces of the enemies of fruit trees if the bands are placed on the trees soon enough, and are examined at reasonably frequent intervals to make sure that none cease to do their work through any one of various possible causes. Do not let it be supposed that the mere fact of a tree being encircled by a greased paper band renders that tree immune from insect attack; there is nothing magic or supernatural about a grease band. The whole truth is this—several species of moths, which are enemies of our principal fruit trees, are due to hatch out at various times between now and next spring. I have already captured a fully developed vapourer moth, and in a good many gardens there will very shortly be a rapid awakening of some of the earliest so-called "winter" moths. The females, which, of course, are the egg layers, are wingless, and when they emerge from the soil around the trees they crawl up the tree trunks to lay their eggs on the twigs and fruit spurs so that the young larvæ shall be within reach of food immediately upon hatching out. The object of grease-banding is to capture these moths by entangling them in the sticky grease before they reach the branches. Obviously, it is a pity to delay the application of the band until a few of the earliest moths have accomplished their journey, for even one moth will deposit eggs enough to produce a mischievous battalion of grubs.

The moths of different kinds hatch out at different and uncertain periods, and although it is a gratifying fact that some of the best proprietary brands of banding grease are capable of retaining their adhesive quality for months—I have found Stickite quite soft and sticky after exposure for three months—it has to be remembered that in windy weather dust, leaves and other substances will as easily stick to the grease as the moths will do, and unless the bands are frequently examined it is quite possible these dry materials may form bridges over the grease, and it is very extraordinary how cunningly the moths will discover any safe means of crossing the paper band which was intended to be their death-trap. I have even known cases where a band has caught so many moths that their carcasses have made a dry footway over which later travellers have safely passed. Hence the necessity not only to start early, but to clean frequently and re-coat the bands during autumn, winter and spring. Instructions given with any of the good brands of grease are so clear and simple that there is no need to explain here how a band should be bound round a tree and evenly coated with grease.

Autumn Spraying.

While foliage remains upon the trees nothing in the way of caustic sprays can be used, but it is well worth while to spray with a summer wash, which will coat the whole surface with a protective film of saponaceous character. Moths are very discriminating in their search for "safe" quarters for their eggs, and will avoid sprayed trees. Many of the fungus pustules which are to be seen on leaves and bark may be checked and destroyed by even a weak solution of Bordeaux mixture, which may be used as soon as the fruit is gathered. Be careful, however, that the spray does not reach lettuces, runner beans or other food crops which are ready for use. A. J. M.

Built to resist the Ravages of Time

TO be thoroughly efficient a Glasshouse must be so constructed that it will resist the rigours of all phases of our variable climate. Rain or sun, wind or frost—it must be impervious to the effect of each.

The most convincing testimony to the work of Duncan Tucker & Sons, Ltd., is the numerous structures designed and erected by them throughout the country.

Well-nigh one hundred years of experience are behind Duncan Tucker's work; it is this specialised knowledge you acquire when you enlist their aid.

If you want distinctive work—yet built *to* last—you need their services.

¶ If you want a Garden Frame, Duncan Tucker & Sons, Ltd., can supply one to meet your needs. There are models for every imaginable purpose, constructed with the care and experience for which Duncan Tucker's are noted.

The prices are the lowest possible, consistent with good workmanship. *Write for full particulars.*

Fruit Tree Banding for Small Orchards

No matter how small the orchard, or whether you have only one or two fruit trees in a garden, it pays to use Stictite Tree Banding Compound.

It traps the crawling insects—Winter, March and Mottled Umber Moths, and so prevents the laying of thousands of eggs which would otherwise hatch out in the spring.

Stictite is extremely "tacky," and remains so throughout the Season, so that one application is sufficient. It will not "run" or dry up after exposure, and withstands the rain.

The sooner the trees are banded the better the result will be. Winter Moth is the first to appear, and emerges about the end of September so that the bands should be on by that time if possible.

Stictite is supplied in tins from ½lb. upwards, and ½lb. will do five or six trees of about 8ins. diameter. The 4lb. and 7lb. sizes are in gold lacquered pails with lids and handles.

½lb., 1/6; 1lb., 2/9; 2lb., 5/-; 4lb., 10/-; 7lb., 17/6.
Larger quantities quoted for if required.

Best Quality Greaseproof Paper

Only good quality paper should be used, and this is supplied as under. The paper is necessary for the application of Stictite, and is quite useless without the Compound.

Yards: 6, 2d.; 12, 3d.; 25, 6d.; 50, 9d.; 100, 1/6; 200, 2/6.

OBITUARY

Sir George Holford.

THE death of Sir George Holford at Westonbirt, Tetbury, on September 11th, has removed a great figure from English life. For many years Sir George was closely associated with royalty, first having been Equerry to the Duke of Clarence and then to the Prince of Wales, until 1899, when he was Equerry to King Edward until his death in 1910. Sir George was formerly Colonel Commandant of the Life Guards. As a connoisseur he was famous. At Westonbirt hangs a magnificent collection of old masters, among them two of the finest Rembrandts in private hands, while at Dorchester House is a fine library, containing not only splendid examples of early illuminated missals, but also a wonderful group of Shakespeare quartos and folios, and the finest copy of the first edition of Bunyan's "Pilgrim's Progress" in a private library.

For many years Sir George had taken a great interest in horticulture and silviculture. His collections of orchids and amaryllis were famous, while of the arboretum at Westonbirt he had made a glory, both in spring and autumn. The arboretum was originally planted by his father, but Sir George had utilised the immense banks of yews and conifers as backgrounds for the brilliant tones of maples and cherries and birches. Many of the rarest trees in the British Isles are to be found at Westonbirt. Not only was Sir George a keen cultivator, but he had a wonderful eye for the points of a tree or shrub. He was a noted authority on placing them where they could be seen to the best advantage, a factor that has done more than anything in making such a wonderful effect of the Westonbirt arboretum.

BOOK REVIEW

THIS little handbook, "Hampton Court Gardens, Old and New," by Ernest Law (G. Bell and Son, 3s. 6d.), the author of the well known "History of Hampton Court," will be found almost equally interesting by those who are actually acquainted with the famous borders in the Palace gardens, and those who only know them by repute. The book, we are told in a preface, is only the forerunner of a larger and more elaborate volume on the subject, but as the title page sets forth, it gives "the lay-out, the full schemes of all the bedding in the herbaceous and mixed borders and the flower beds and shows the position of every flower and shrub in the Garden." Surely only a greedy soul would ask for more. Recalling one's impression of the gorgeous effect of the herbaceous border, it comes as rather a surprise, on studying the plan, to find how few of the plants are rare or even not very well known, the great majority being the familiar things we all grow, and of these many are not what are generally regarded as the best varieties. Perhaps this is as it should be in a border which is primarily intended to appeal to the man in the street, rather than the gardener. Still it is a little difficult to understand why certain important families of plants are so sparsely represented; the campanula, for instance, and although this omission is less noteworthy, the centaureas. Very few liliums, moreover, appear in the lists. Only a small number of the annuals grown are mentioned, but these include sweet peas, all, or nearly all of which are varieties—Etta Dyke, Countess Spenser, Queen Alexandra, Asta Ohn and Thomas Stevenson, for example—which have been long since superseded by improved kinds.

Mr. Law's views on plant nomenclature are somewhat similar to those of Mr. W. Robinson. He has a great aversion to "those horrid, absurd, uncouth Latin names, which convey nothing to most people and which few can pronounce which these high-brow botanists are trying to force on simple-speaking gardeners and lovers of gardens." No doubt there is a good deal to be said for his point of view, but after all, is "Chinese grape-flower" so much simpler than "Wistaria," and "Hedgehog Flower" than "echinops?" And how many people would recognise Solanum jasminoides under the name of "Potato-climber," or Kerria japonica under the already double appropriated title of "Bachelor's Buttons"?

The book is fully and most excellently illustrated from photographs and sketches. There are many clearly drawn plans, including an interesting one of the "Knott Garden," laid out in 1920, and the description of the various features of, and the historic notes on, the Gardens, necessarily brief, though they are admirably lucid. As a guide to the visitor to Hampton Court, who is also a gardener, the value of the little volume cannot be over-estimated.—R. E. H.

CATALOGUES RECEIVED.

Messrs. Dobbie and Co., Limited, Edinburgh.—For the amateur a well illustrated and classified catalogue giving cultural hints is extremely useful. A catalogue of this type has just come to hand from the above firm. In it daffodils, hyacinths, tulips and bulbous plants of every kind are listed. Many sweet pea novelties are also given.

Messrs. Wakeley Brothers, Honduras Wharf, Bankside, London, E.C.—This firm, who prepare the celebrated hop manure, can also supply bulbs, composts, bulb fibre, garden ornaments, garden lime, etc., particulars of which can be found in their new catalogue.

Messrs. Foster and Pearson, Beeston, Notts.—Since the year 1841 this firm has been building greenhouses, and during that time their reputation has spread far and wide. In their new catalogue there are over 100 illustrations, designs of greenhouses and conservatories which they have constructed all over the country. This catalogue should be procured by all those contemplating the erection of glass structures.

Messrs. Barr and Sons, 11, King Street, Covent Garden.—Three different bulb catalogues have been received from this well known firm of bulb specialists. All daffodil enthusiasts should hasten to procure the list of gold medal daffodils, so that they can make an early application for the newer seedling daffodils, which in some cases are offered for the first time. Those gardeners interested in irises or nerines should write for this firm's catalogues. Useful cultural directions will be found.

Messrs. E. Webb and Sons, Stourbridge.—A useful and well compiled catalogue, illustrated with numerous half-tone reproductions, should prove of service to all amateur gardeners. Some of the best bulbs for bedding and growing in fibre are given.

Messrs. Blackmore and Langdon, Bath.—Delphiniums, begonias and cyclamens are the chief plants in which this firm specialises. Numerous exceedingly good varieties have been raised by them, and in their catalogues, which have just come to hand, some of the finest are listed.

Messrs. R. H. Bath, The Floral Farms, Wisbech.—An illustrated catalogue of choice bulbs, roses, peonies, carnations and fruit trees for autumn planting. The lists of bulbs and peonies are most comprehensive.

Messrs. Finneys, Newcastle-on-Tyne.—Bulbs, fruit trees, garden implements, and a short list of roses, are included in this catalogue.

Messrs. R. Sydenham, Limited, Tenby Street, Birmingham.—A handy list of bulbs for the garden and greenhouse. The interesting article on growing bulbs in bowls without drainage should prove of great service to the amateur.

GARDEN PATHS

HOW TO MAKE & MAINTAIN THEM

PATHMAKING is a very important feature of the work in connection with the laying out of a garden. Before actually starting the work of forming the paths it is essential to decide just what one is going to do, and here even the roughest plan of the land will prove helpful. It is well to keep in mind that paths in the garden are essential and should be designed to go simply where it is necessary that they should go. In the average garden an elaborate system of walks is really quite out of harmony, and may easily destroy the good effect of the whole. On the other hand, there is no reason why all the paths should be dead straight. A little bend here and there, especially round some object like a bush or the projection from a rock garden, makes a natural and pleasing variation. Having decided the course which the pathways shall follow, one must consider the question of width. This should be at least 3ft. for the main one in a small garden and greater width in proportion for a larger piece of ground. By-paths leading into the main walks might be about 2ft. 6ins. in width, or even rather less than this in some cases.

The Foundations for Paths.

It is true to say that the most important part of a path is that which, in the ordinary way, is not seen. However well the surface may be formed, if the foundations are wrong the path will never be satisfactory. The idea is to plan matters so that the path will be just as pleasant to walk upon in winter after weeks of wet weather as it is in the summer. Should the soil be of a heavy nature, it should be taken out to the depth of at least a foot in the pathways. The soil thus obtained may be spread evenly over the adjoining ground. Every path should be made up in three layers. Start with about 6ins. of broken bricks or large clinkers. This must be well rammed down to make a solid foundation, through which, nevertheless, water will freely pass. Over the clinkers a 4in. layer of coarse gravel or small clinkers should be arranged. This should also be rammed down, but not quite so firmly as the lower layer. A foundation prepared on the lines indicated will be satisfactory except where the soil is of a retentive nature or the path runs to very low levels. Here there is always a likelihood that the water will stand in rainy weather, and some special form of drainage should be adopted. Where it is realised that the natural drainage of the land is not good it is an excellent plan to take out the original trench to an additional 2ins. or 3ins. If they can be obtained, broken glass bottles are excellent for strewing in the bottom before placing the layer of brick bats or large clinkers. The simple type of drain commonly known as a "soakaway" is most useful to employ at special points. These drains are simply formed in the following manner: At the lowest point of the path and towards the side open up a hole in the ground which is about 3ft. in depth. Fill in the bottom with clinkers or broken bricks, and then on this place an old drain pipe. Matters should be arranged so that the top of the drain pipe is in a little hollow somewhat below the surface of the path which surrounds it. Fill the space between the pipe and the sides of the hole with stones and shingle, beating these firmly down. The top of the pipe may be covered with a flat stone or, if desired, a small iron grating could be secured and fitted over the opening. These soakaways will prove of immense service, particularly during heavy showers and, if properly adjusted, will entirely prevent the flooding of the path. Of course, if there is any way of connecting the soakaway with pipes to some lower outlet, so much the better, but it is only now and again that this is possible.

Path Surfaces.

The walks will now be ready for surfacing, but it is well not to be in too much of a hurry to complete them. Wait until a really wet day comes when the rain keeps on for hours, and then see what is happening to a half-made path. If there are any places where the water does not clear away as quickly as it should it is safe to conclude that the drainage at this point is faulty. Perhaps below the point to which the trench was opened there is a bed of clay which is impervious to the passage of water. In such a case there is nothing for it save to take out the ground to a greater depth and fill in with more drainage material. In this way the annoyance and bother of re-making a surfaced path is avoided.

Although several kinds of surfaces are used in the making of garden paths there is much to be said in favour of gravel. In many districts there is not much difficulty in getting good gravel, the best material, of course, being that which binds well and thus presents a smooth surface. It pays to spend a little more to get really good gravel, as the inferior qualities often to be met with in coast localities will never make a really satisfactory path. For shaded walks and parts of the kitchen garden a cinder path is to be highly recommended. This not only provides a dry surface even in the wettest weather, but in addition weeds and moss do not readily grow on the surface. Where there is a steep rise in a path asphalt and concrete are now and again employed. The hard surfaces do not gutter after heavy rainfall, but in other ways they hardly appeal to the ordinary gardener.

Edgings.

Before actually starting to surface the path some attention must be given to the matter of the edgings. Of course, where the path runs along by the side of a lawn the grass will form a natural edging. Again, the border might consist of a strip of grass separating the walk from the flower-bed. The best border is that which serves its purpose in preserving the outline of the path without being greatly in evidence. In a small garden a wooden edging to a path is by far the cheapest, and if the wood is first creosoted it will last for years. Old bricks, if these are well sunk and set one upon another at an angle of 45°, are not wholly displeasing, especially after these have weathered and become moss grown. Apart from a grass strip various plants may be used with good effect to border paths. Box is an old-world favourite, but the close-growing little shrubs certainly harbour snails and slugs to an alarming extent. Shoots of ivy pegged down to encourage quick rooting will form quite a good border. Other suitable edging plants include thrift, daisies, mossy saxifrages, London pride, the evergreen Verbonica rupestris and Euonymus microphyllus. These may be arranged in long narrow strips or planted in the form of a narrow rockery. In this latter case many other suitable rock subjects might find a home.

Gravel Paths.

Having decided upon and fixed or planted the edging, the last stages in the making of the path may be carried out. Where a sufficient amount of gravel can be secured the depth of the final layer might be from 3ins. to 4ins. Of course, quite a good path can be made with a layer of half this thickness, especially if the foundations are good and the gravel itself is of a binding nature. Paths with only an inch of gravel on the top will often last in good order for years if they receive an occasional raking. For spreading the gravel a wooden rake will be found to be a handy tool. To throw off the water from the centre to the sides the pathway should be somewhat higher in the middle, being rounded or domed after the manner of a well constructed road. The actual height of the centre of the walk above the level of the edges will be determined by the width of the path. If the edges of the path are on about the same level, it is not difficult to shape out the form of the surface with the eye alone. A simple device in which the curve of the path is cut from a piece of wood is handy when pathmaking. With this the shape of any particular section of the path may be tested from time to time and irregularities rectified by raking the gravel over again or, if needful, adding fresh material. The device will prove very useful when the roller is brought into use.

Rolling.

This is really a very important part of path making, for without a good deal of rolling it is impossible to get a good surface. As one proceeds with the rolling keep a sharp eye on the form that the path is taking. Under the pressure of the roller certain positions may cave in a little so that something like a hollow is formed. These depressions are instantly revealed when the path is tested with the curved wood, and the situation must be raked over once more and a little of the finer gravel added before the roller is applied again. When the ground is soft after rain it is always worth while giving a recently made path a rolling. In fact, the more the path is rolled during the first few weeks the better it will look and the longer it will last in good order.

The Cultivation of Tobacco—No. 4.

Examination of Plants.

THE British Farmer knows when to cut his corn by the gradual change of colour. There is no such indication where tobacco is concerned.

The leaf must be fully grown or it is useless; on the other hand it must be gathered while it is still green or it will be blotchy.

It therefore requires great judgment on the part of the Tobacco Grower to know when the plant is just in that condition to produce the Rich, Ripe Virginia Leaf used in the making of

Burpee's
NEW SWEET PEAS for 1927

GLADNESS A soft coral-pink, intensified by a suffusion of a deeper shade toward the base of the standard and wings. The softest and daintiest of all pinks. Of exquisite delicacy, enhanced by a lemon keel.

DELIGHTFUL A rich terra-cotta cerise, suffused orange or scarlet-red. A colour never before produced—the most appealing, in its glowing beauty, of all the richer toned varieties; bright and shining even on dull days, and startlingly brilliant under artificial light.

ROYAL BLUE A true Royal Blue, but full of life and brilliancy instead of dull and uninspiriting; undoubtedly the brightest of all sweet pea dark blues. A flower of great substance and enchanting beauty, extremely prolific in fours.

ON SALE BY THE LEADING WHOLESALE HOUSES

Notes from Maidstone.

CHERRIES IN MAY.

Fruit is scarce in early May, but the Chinese Early Cherry we now introduce will enable anyone with an unheated greenhouse to add cherries to their dessert at this season. It is extraordinarily prolific and self-fertile, and as a fan (15/-) on the wall, or as a bush (7/6) in a pot or planted out in the border, this luxury is easily attainable.

THE GARDEN

VOL. XC.—No. 2861. OCTOBER 2, 1926 PRICE TWOPENCE.

THE AMATEUR FRUIT SHOW

WE wish to draw the attention of our readers to the Fruit Show which is to be held in the Royal Horticultural Society's Hall, Vincent Square, Westminster, S.W.1, on October 12th and 13th. Every year this Show increases in size and in importance, and this year it is the desire of the Council of the Society to make it a thorough success, so as to be of some lasting value to all amateur growers of fruit. With this end in view, various new features have been incorporated in the schedule, which should be in the hands of all interested fruit growers.

This season, a notoriously bad one for all fruit crops, except, perhaps, plums and pears, many amateurs may have some little difficulty in sending exhibits, but some effort should be made to make at least a small contribution to aid the Society in their efforts to make the Show a success, and in this way to increase and popularise fruit growing in gardens, both large and small, up and down the country. Amateurs should make it their business to grow fruit. It is a national necessity. Our own varieties of fruits are among the best that the world has to offer and a home-grown apple or pear has always much more to recommend it than those from abroad. Moreover, the amateur will find fruit growing full of interest and once he gets the length of exhibiting his produce at a Show like this one, then he will have caught the fever. It is only in this way through the medium of exhibitions such as this one, where keen competition is entered into, that an all-round general improvement can be registered in fruit culture.

The principal differences in this year's schedule, compared to those of former years, are that in Division I, open to amateurs only for fruit grown under glass or otherwise, the value of the prizes has been increased, while the classes for collections of grapes have been modified to meet present-day conditions, when fewer varieties are grown than formerly, and an additional class has been provided for a collection of eighteen dishes of hardy fruits. Division No. II, open to nurserymen only, has been amended by the provision of a new class for the smaller nurseries. In the past there has been only one class for market growers, now, in addition to two classes for apples in standard boxes, there are classes for apples and pears packed in peach boxes, and two classes for grapes. Moreover, substantial money prizes are offered, as well as medals and cups. In Division IV, open to amateurs only, for "fruits grown in the open air," there is a new class for peaches, while the single dish division, again only open to amateurs, has been enlarged by the provision of classes for three more apples, namely Monarch, William Crump and St. Cecilia.

Division V is an interesting one, catering, as it does, for exhibits for outdoor fruits from all parts of the country, and it is to be hoped that advantage will be taken of this class and that numerous entries will be forthcoming. Such a class has an undoubted value in that it indicates the general state of the fruit crops in different parts of the country.

The present Show is chiefly one for the amateur. The classes are numerous and cover a wide field, so that practically any amateur fruit grower who is sufficiently keen stands a chance of success. It is only by the support of the thousands of keen gardeners in the country that this Show can be made the success it ought to be. Exhibits are welcomed and additional information and copies of the schedule will be only too willingly supplied on application to the Secretary, R.H.S., Vincent Square, London, S.W.1.

While on the topic of fruit a word of warning regarding its storage may not come amiss. All amateur fruit growers should remember that properly stored fruit remains in good condition considerably longer than fruit which has received indifferent treatment. Both apples and pears need careful handling when picking. They should not be bruised in gathering or when placing in the fruit store. Careful grading is essential, and only perfect fruit of even size should be stored for the winter; damaged, diseased and inferior specimens should be set aside for present use. A cool, well ventilated, dark storeroom which is frost-proof is the most satisfactory. Wooden sheds with corrugated iron roofs, as well as dry buildings, are bad, as the fruit in them is liable to shrivel. It is best to place the fruit in single layers on trays lined with straw or hay. Choice dessert fruit may be wrapped singly in grease-proof paper, and in this way an apple such as Cox's Orange Pippin will keep in good condition until the beginning of February.

HAVE YOU

¶ *Made an autumn sowing of sweet peas and hardy annuals?*

¶ *Finished planting your bulbs? If not, this should be completed soon, otherwise the bulbs will not have a sufficiently long season of growth.*

¶ *Ordered herbaceous plants for replenishing the mixed border?*

¶ *Lifted your early gladioli?*

¶ *Prepared, by deep digging and manuring, your beds and borders for autumn planting?*

¶ *Patched, renovated and fed your lawn?*

¶ *Grease-banded your fruit trees?*

¶ *Thinned your loganberries and summer-fruiting raspberries?*

¶ *Given your maincrop celery its final earthing up?*

¶ *Trimmed your evergreen hedges?*

Novelties Seen at Holland Park

IT may interest our readers to call their attention to a few of the excellent novelties which were exhibited at this show. The four which are mentioned here should prove really valuable hardy border plants, and each one has some particular merit of its own. Among the Michaelmas daisies was a new variety aptly named Ruby Tips of upright habit, and with flowers of rose pink.

Phlox Border Gem was another novelty. It is one of the brightest of blue-purple varieties yet raised. Mount Etna was the most conspicuous variety among the newer torch lilies seen at the Show. It is tall and stately in growth and has large handsome spikes of glowing salmon scarlet. Solidago Ballardii was a fine new golden rod which was exhibited. Its merits lie in its light and loosely formed pyramidal spray of flowers, an arrangement which is more attractive than in some of the older varieties which are inclined to be somewhat heavy in appearance. The tiny flowers are bright clear yellow in colouring, and the plant is of good habit.

ROCK GARDENING IN TOWNS AND SUBURBS

IT is an open secret that scarcely any phase of gardening has become more popular within recent years than rock gardening. Its devotees are to be found in all parts of the country, even among those to whom horticulture has not previously appealed, and, go where you will, evidence is to be found which leaves no doubt that many are fascinated with it.

It does not seem so many years since that it was spoken of as "a mere craze," and there were those who prophesied it would be short-lived. They were wrong in their prophecy, and to-day it is scarcely possible to go into any suburban locality without meeting with rock gardens. Personally, I think that the miniature gardens to be seen at every horticultural show of any size have done much to stimulate interest, and have been the means of suggesting to visitors the possibility of something of the kind in their own garden. Discussing the question with a man connected with a large stone quarry, he told me that, what with stone being required for certain classes of houses, for crazy paving, and for the formation of rock gardens, they had plenty of orders. Obviously, the desire for a garden of this character has given considerable impetus to the raising and cultivation of alpine and other plants for furnishing them, and from personal observation I have come to the conclusion that never before has there been such a demand for them.

As showing the keen interest now being taken in this department of gardening, I have recently noticed in connection with sales of suburban property that prominence is frequently given in bills announcing such sales to there being "a good rock garden." It is not surprising, therefore, that the dweller in and quite near to a town, with a garden of modest dimensions, has become infatuated and, seeing what other people are doing in transforming the few yards of ground —possibly, they own—takes up rock gardening with a zest.

Making a Start.

Having made up their minds to have a rock garden, people begin to look about and enquire as to the best and most economical way to proceed. It is always safe to take the opinion of someone in the locality who has constructed one, and gain what information is possible. Those who have had no experience of making one of these gardens will often find it better to obtain an estimate from a specialist, rather than procure material and construct one himself. It should not be forgotten that it is a rock *garden* that is required, and not a display of architecture and ornamentation. It will be patent to anyone that, in these days of heavy haulage charges and increased cost of labour, it will be cheaper to procure stone as near one's home as possible than to send to a distance for it.

Those who have a taste for gardening, however, will not let the constructing of such a garden act as a stumbling block, but will be their own workmen. There is much information to be gleaned from modern publications with respect to the erecting and planting of a rock garden which will be found a great help to the handy-man. It is best, however, before one makes an attempt, to draw a plan, having regard to the space at one's disposal, as, if it is not strictly adhered to, it will be a guide, and is much better than starting in a haphazard way and, possibly, having some of the work to undo.

No more convenient time for a beginning can be selected than autumn, as by spring, when most of the planting should be done, the structure will have "settled."

Furnishing.

Here, again, one should be guided by the experience of others. The tyro will, possibly, display an anxiety to fill every niche and crevice, every overhanging ledge and scree with plants. To do so would be unwise, as subjects in a rock garden differ so widely and grow so rapidly that scarcely before a year has elapsed some of the very dwarf subjects are smothered or obscured by plants of more vigorous growth. An example in one "home-made" rock garden will explain what is meant: A patch of Thymus serpyllum coccineum (a little well known carpeter growing about 3ins. high) was planted in close proximity to a plant of Arabis albida fl. pl. It did not take long for the latter to cover the thyme completely. Instances of unwise "mating" might be multiplied. It involves less trouble and expense if each plant put in is given ample room for development, and its habit should be studied before consigning it to its quarters.

Should there be overhanging ledges in the garden, opportunity is best taken to plant things of a procumbent or trailing character, like helianthemums, aubrietias, Gypsophila repens or the evergreen candytuft, Iberis sempervirens. In niches one can make good use of dwarf campanulas. In dry sunny positions it is worth while remembering such things as Saxifraga longifolia, Erinus alpinus and Androsace sarmentosa. For moist and partly shaded places Arenaria balearica and various primulas, like Juliæ, Rosea and Wanda, are worthy of consideration.

A TOWN ROCK GARDEN, A YEAR AFTER ITS FORMATION.

It indicates what may be readily accomplished by any amateur with limited space at his disposal.

General Remarks.

In the making of a rock garden the temptation is to overdo it by attempting more than the space for such a structure warrants, and in planting too many subjects. As a general rule, the more simple the structure the more satisfaction it will give. One can add to a small rock garden as time goes on. One's ideas sometimes undergo a change, and we see where improvements might be made. In the making of paths and in leaving space between the stones for plants it is well to have some plan as to what we desire to put there, providing the particular soil for the tenant before the stones are laid, and not "sticking" in plants after stones are placed, without regard to their likes or dislikes—whether lime-lovers or peat-lovers. This article is intended mainly for the benefit of those who contemplate forming a small rock garden and doing most of the work themselves, and is prompted by the writer having made one on such lines in his garden.

By a careful selection of subjects a rock garden may be made interesting for the greater part of a year, and not in spring only, as so many seem to think. Early-flowering bulbs, such as scilla, chionodoxas, Scilla sibirica, snowdrops and crocuses, should be given the benefit of a warm, sheltered nook, to be followed by aubrietias, violas and other spring-flowering things; while in the later months of the year one will not be unmindful of the wealth of beauty in the flowers of that gem of the gentians, *viz.*, sino-ornata, reference to which was made in THE GARDEN on July 31st. I know that I am voicing the opinion of some who read these notes when I say that a rock garden, wisely planted, can, and may, be a place of delight at most seasons.

PLANTS AT THEIR BEST IN AUTUMN

This is the second of a series of contributions to THE GARDEN by the well known writer on horticulture, Mr. A. J. Macself. It is an enlargement of our notes "Worthy Plants" that have been such a popular feature.

THE BRILLIANT SCARLET BLOSSOMS OF ROSA MOYESII.

An Echinacea of Real Merit.

FOR nearly a month, and still blooming bravely, a variety of echinacea—or, as it was formerly called, Rudbeckia purpurea—has been claiming a steadily increasing share of my affections. The old type is a plant for which I could never summon any enthusiasm, for its habit of drooping its petals gives it a listless, lazy air, while its dull magenta or puce shade seems dowdy and extremely dull. The new variety with which I am enamoured is named "The King," and it is well worthy of such a name. Quite ordinary cultivation has produced blooms 5½ins. in diameter, and these flowers hold their petals well up, making a flower as flat and symmetrical as the best varieties of Chrysanthemum maximum. The petals have breadth as well as length, and the disc is a beautiful globular cushion with a spiny surface of a polished mahogany colour, eventually opening tiny florets in rings to expose golden yellow stamens. The colour of the petals is clear old rose, bright and clean in effect. Echinacea The King is a plant to buy this season to ensure a pleasing display in your autumn garden a year hence.

The Peardrop "Hips" of Rosa Moyesii.

BEAUTIFUL enough when clothed in its unique, flat and intensely coloured blossoms among their setting of prim little leaves and formidable, yet handsome, thorns, Rosa Moyesii is more picturesque still, now the long branches of an established and well developed bush are clothed with its lobster-red "hips" or seed pods, which hang like strings of handsome pear-shaped beads of Oriental splendour. There are other berry-bearing roses which have their claims to admiration, but R. Moyesii is one of the finest when the plant is given head room and nourishment to develop into a strong-limbed bush. This rose was well-nigh ruined a few years since by the importation of a lot of inferior seedlings from the Continent which not only varied in the colour intensity of their flowers, but in the size, shape and colour of the seed vessels. Fortunately, our best growers, and particularly Mr. J. C. Allgrove of Langley, saw and realised the gravity of the mischief, and, by selecting the very best form in cultivation, and propagating this by budding on canina stock, the situation has been saved. So vastly different is the true stock from the inferior foreign seedlings that whoever may happen to possess the latter should not hesitate to grub up the plants and replace with the genuine article.

Salvia Harbinger.

OUT of the five distinct types or varieties of scarlet salvia grown this season, Harbinger has proved so decidedly superior that it is the only one I shall attempt to grow next season. I wanted to make quite sure of a bright show of scarlet in July, and so secured some plants which were raised from seed sown last September and wintered under glass. Early in the New Year they were potted into 48's, and were planted at the end of May. Not only was the bed ablaze with scarlet before mid-July, but it is still gloriously brilliant, and has not had a blank day throughout. To test the reliability of the statement that spring-sown seedlings will flower profusely the same year, I tried another batch, sown at the beginning of March, potted first into thumbs, then 60's, and planted out on June 8th. The plants "showed colour" by the first days of July, but these first central spikes were pinched out, and it is remarkable how suddenly the laterals jumped along, and before the end of July these plants, although not so large as the autumn-sown, were just as gay; and at the present time they look capable of going on till Christmas. I believe they would, in pots in a light, airy greenhouse, keep company with the cyclamen, winter-flowering begonias, and greet the first of the azaleas and forced bulbs. Salvia Harbinger is decidedly one of the very best of good plants, and it is sheer folly to cling to the old types and forms of S. fulgens.

Berberis Stenophylla Autumnalis.

LAST spring I planted quite a small plant of this delightful little barberry, and in a short space of time it gave me a brief display of its dainty sulphur and bright yellow flowers; but the spring display was small in comparison with its present show, every slender arching stem being bespangled with brighter and exceedingly lovely blossoms.
